If this parameter is specified, the command displays information only about object stores whose configuration name matches the specified names.

`[-aggregate-name <aggregate name>]` - Aggregate

If this parameter is specified, the command displays information only about the specified aggregates that were deleted.

`[-request-state {queued|running|cleaning-up}]` - Request State

If this parameter is specified, the command displays information only about the object stores that have the specified object freeing request state.

`[-num-objects-freed <integer>]` - Num Objects Freed

If this parameter is specified, the command displays information only about the object stores that have the specified number of objects that have been freed.

[-last-error <text>] - The Last Error Encountered

If this parameter is specified, the command displays information only about the object stores that have the specified last error encountered.

storage aggregate object-store show-space

Display space utilization of object stores attached to an aggregate

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage aggregate object-store show-space` command displays information about the amount of space used in the object store for each of the aggregates in FabricPool. The used space is displayed in both absolute size as well as a percentage of the FabricPool license limit.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-aggregate <text>] - Aggregate Name

If this parameter is specified, the command displays space information only about object stores that are attached to the specified aggregates.

[-object-store-name <text>] - ONTAP Name for this Object Store Config

If this parameter is specified, the command displays space information only about object stores whose configuration name matches the specified names.

[-object-store-availability <object Store Availability>] - Availability of the Object Store

If this parameter is specified, the command displays space information about the object stores whose availability status matches the specified value. Supported values with this parameter are - available and unavailable.

[-provider-type <providerType>] - Type of the Object Store Provider

placeholder

[-license-used-percent <percent_no_limit>] - License Space Used Percent

If this parameter is specified, the command displays space information only about object stores whose space used by the associated aggregate as a percentage of the license limit matches the specified value. If the object store does not require a license, then this field is not set.

[-unreclaimed-space-threshold <percent>] - Threshold for Reclaiming Unreferenced Space (privilege: advanced)

If this parameter is specified, the command displays information only about object stores whose threshold for reclaiming unused space from objects in the object store matches the specified value.

Examples

The following example displays space information about all object stores:

```
cluster1::>storage aggregate object-store show-space
```

storage aggregate object-store config commands

The config directory

storage aggregate object-store config create

Define the configuration for an object store

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage aggregate object-store config create` command is used by a cluster administrator to tell Data ONTAP how to connect to an object store. Following pre-requisites must be met before creating an object store configuration in Data ONTAP.

- A valid data bucket or container must be created with the object store provider. This assumes that the user has valid account credentials with the object store provider to access the data bucket.
- The Data ONTAP node must be able to connect to the object store. This includes
 - Fast, reliable connectivity to the object store.
 - An inter-cluster LIF (Logical Interface) must be configured on the cluster. Data ONTAP will verify connectivity prior to saving this configuration information.
 - If SSL/TLS authentication is required, then valid certificates must be installed.
 - FabricPool license (required for Amazon S3 and Azure object stores).

An object-store configuration once created must not be reassociated with a different object-store or container. See [“storage aggregate object-store config modify” on page 812](#) command for more information. If no access key ID is provided while setting up a configuration for AWS_S3 object store, Data ONTAP will try to obtain access key ID and secret access key through Data ONTAP Cloud in AWS using the AWS Identity and Access Management (IAM) role. If Data ONTAP is unable to create a object store configuration, then the command will fail explaining the reason for failure.

Parameters

-object-store-name <text> - Object Store Configuration Name

This parameter specifies the name that will be used to identify the object store configuration. The name can contain the following characters: "_", "-", A-Z, a-z, and 0-9. The first character must be one of the following: "_", A-Z, or a-z.

-provider-type <providerType> - Type of the Object Store Provider

This parameter specifies the type of object store provider that will be attached to the aggregate. Valid options are: AWS_S3 (Amazon S3 storage), SGWS (StorageGrid WebScale) and Azure_Cloud (Microsoft Azure Cloud).

-server <Remote InetAddress> - Fully Qualified Domain Name of the Object Store Server

This parameter specifies the Fully Qualified Domain Name (FQDN) of the remote object store server. For Amazon S3, server name must be an AWS regional endpoint in the format s3.amazonaws.com or s3-<region>.amazonaws.com, for example, s3-us-west-2.amazonaws.com. The region of the server and the bucket must match. For more information on AWS regions, refer to 'Amazon documentation on AWS regions and endpoints'. For Azure, if the -server is a "blob.core.windows.net" or a "blob.core.usgovcloudapi.net", then a value of -azure-account followed by a period will be added in front of the server.

[-is-ssl-enabled {true|false}] - Is SSL/TLS Enabled

This parameter indicates whether a secured SSL/TLS connection will be used during data access to the object store. The default value is true.

[-port <integer>] - Port Number of the Object Store

This parameter specifies the port number on the remote server that Data ONTAP will use while establishing connection to the object store.

-container-name <text> - Data Bucket/Container Name Used in S3 Requests

This parameter specifies the data bucket or container that Data ONTAP should read and write to.

{ [-access-key <text>] - Access Key ID for AWS_S3 and SGWS Provider Types

This parameter specifies the access key (access key ID) required to authorize requests to the AWS S3 and SGWS object stores. For an Azure object store see `-azure-account`.

[-secret-password <text>] - Secret Access Key for AWS_S3 and SGWS Provider Types

This parameter specifies the password (secret access key) to authenticate requests to the AWS S3 and SGWS object stores. If the `-access-key` is specified but the `-secret-password` is not, then one will be asked to enter the `-secret-password` without echoing the input. For an Azure object store see `-azure-private-key`.

[-azure-account <text>] - Azure Account

This parameter specifies the account required to authorize requests to the Azure object store. For other object store providers see `access-key`.

[-ask-azure-private-key {true|false}] - Ask to Enter the Azure Access Key without Echoing

If this parameter is true then one will be asked to enter `-azure-private-key` without echoing the input. Default value: `true`.

[-azure-private-key <text>] - Azure Access Key

This parameter specifies the access key required to authenticate requests to the Azure object store. See also `ask-azure-private-key`. For other object store providers see `-secret-password`.

[-ipspace <IPspace>] - IPspace to Use in Order to Reach the Object Store

This optional parameter specifies the ipspace to use to connect to the object store. Default value: `Default`

[-use-iam-role {true|false}] - Use IAM Role for AWS ONTAP Cloud

This parameter specifies whether IAM credentials must be used for data access from AWS_S3 object store. This parameter is required only when setting up a AWS_S3 object store configuration in Data ONTAP. The IAM credentials required for setting up this configuration will be obtained through Data ONTAP Cloud in AWS. This option is available only through ONTAPI.

[-is-certificate-validation-enabled {true|false}] - Is SSL/TLS Certificate Validation Enabled

This parameter indicates whether an SSL/TLS certificate of an object store server is validated whenever an SSL/TLS connection to an object store server is established. This parameter is only applicable when `is-ssl-enabled` is true. The default value is true. It is recommended to use the default value to make sure that Data ONTAP connects to a trusted object store server, otherwise identities of an object store server are not verified.

Examples

The following example creates a object store configuration in Data ONTAP:

```
cluster1::>storage aggregate object-store config create -object-store-name
my_aws_store -provider-type AWS_S3 -server s3.amazonaws.com
-container-name my-aws-bucket -access-key DXJRXHPXHYXA9X31X3JX
```

storage aggregate object-store config delete

Delete the configuration of an object store

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage aggregate object-store config delete` command removes an existing object store configuration in Data ONTAP. The configuration cannot be deleted if it is used by any aggregates or if the system is still freeing objects from the object store from a previously executed [“storage aggregate delete” on page 763](#) command. The command [“storage aggregate object-store show” on page 807](#) can be used to view the aggregates attached to the object store before issuing the delete command.

Note: The [“storage aggregate object-store show” on page 807](#) command will not display aggregates that have been previously deleted but still has objects in the object store.

Parameters

-object-store-name <text> - Object Store Configuration Name

This parameter specifies the object store configuration to be deleted.

Examples

The following example deletes an object store configuration named my-store:

```
cluster1::>storage aggregate object-store config delete -object-store-name my-store
```

storage aggregate object-store config modify

Modify object store configuration attributes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage aggregate object-store config modify` command is used to update one or more of object store configuration parameters. This command must not be used to reassociate an existing valid object-store configuration to a new object-store or container. The modifiable parameters include object store name, server name, port, access_key, secret-password, ipspace and is-ssl-enabled.

Parameters

-object-store-name <text> - Object Store Configuration Name

This parameter identifies the configuration to be modified.

[-new-object-store-name <text>] - Object Store Configuration New Name

This optional parameter specifies the new name for the object store configuration.

[-server <Remote InetAddress>] - Fully Qualified Domain Name of the Object Store Server

This optional parameter specifies the new Fully Qualified Domain Name (FQDN) of the same object store server. For Amazon S3, server name must be an AWS regional endpoint in the format `s3.amazonaws.com` or `s3-<region>.amazonaws.com`, for example, `s3-us-west-2.amazonaws.com`. The region of the server and the bucket must match. For more information on AWS regions, refer to 'Amazon documentation on AWS regions and endpoints'. For Azure, if the `-server` is a `"blob.core.windows.net"` or a `"blob.core.usgovcloudapi.net"`, then a value of `-azure-account` followed by a period will be added in front of the server.

[-is-ssl-enabled {true|false}] - Is SSL/TLS Enabled

This optional parameter indicates whether a secured SSL/TLS connection will be used during data access to the object store.

[-port <integer>] - Port Number of the Object Store

This optional parameter specifies a new port number to connect to the object store server indicated in the `-server` parameter.

[-access-key <text>] - Access Key ID for AWS_S3 and SGWS Provider Types

This optional parameter specifies a new access key (access key ID) for the AWS S3 and SGWS object stores.

[-secret-password <text>] - Secret Access Key for AWS_S3 and SGWS Provider Types

This optional parameter specifies a new password (secret access key) for the AWS S3 and SGWS object stores. For an Azure object store see `-azure-private-key`. If the `-access-key` is specified but the `-secret-password` is not then one will be asked to enter the `-secret-password` without echoing the input.

[-ask-azure-private-key {true|false}] - Ask to Enter the Azure Access Key without Echoing

If this optional parameter is true then one will be asked to enter the `-azure-private-key` without echoing the input.

[-azure-private-key <text>] - Azure Access Key

This optional parameter specifies a new access key for Azure object store. For other object store providers see `secret-password`. See also `ask-azure-private-key`.

`[-ipspace <IPspace>]` - IPspace to Use in Order to Reach the Object Store

This optional parameter specifies new ipspace values for the configuration.

`[-use-iam-role {true|false}]` - Use IAM Role for AWS ONTAP Cloud

This optional parameter specifies whether to enable IAM role for this object store configuration. IAM role can be enabled only if connecting to AWS object store in Data ONTAP Cloud. When using this parameter, `-secret-password` and `-access-key` parameters must not be explicitly specified as they will be obtained from Data ONTAP Cloud in AWS using the IAM role.

`[-is-certificate-validation-enabled {true|false}]` - Is SSL/TLS Certificate Validation Enabled

This optional parameter indicates whether an SSL/TLS certificate of an object store server is validated whenever an SSL/TLS connection to an object store server is established. This parameter is only applicable when `is-ssl-enabled` is `true`. It is recommended to keep the default value which is `true` to make sure that Data ONTAP connects to a trusted object store server, otherwise identities of an object store server are not verified.

Examples

The following example modifies two parameters (port number and `is-ssl-enabled`) of an object store configuration named `my-store`:

```
cluster1::>storage aggregate object-store config modify -object-store-name my-store -port 1235 -is-ssl-enabled true
```

storage aggregate object-store config rename

Rename an existing object store configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage aggregate object-store config rename` command is used to rename an exiting object store configuration.

Parameters

`-object-store-name <text>` - Object Store Configuration Name

This parameter identifies an existing object store configuration.

`-new-object-store-name <text>` - Object Store Configuration New Name

This parameter specifies the new object store configuration name.

Examples

The following example renames an object store configuration from `my-store` to `ms1`:

```
cluster1::>storage aggregate object-store config rename -object-store-name my-store -new-object-store-name ms1
```

storage aggregate object-store config show

Display a list of object store configurations

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage aggregate object-store config show` command displays information about all existing object store configurations in the cluster.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-object-store-name <text>`] - Object Store Configuration Name

If this parameter is specified, the command displays information only about object store configurations whose name matches the specified names.

[`-object-store-uuid <UUID>`] - UUID of the Object Store Configuration

If this parameter is specified, the command displays information only about object store configurations whose UUID matches the specified UUID values.

[`-provider-type <providerType>`] - Type of the Object Store Provider

If this parameter is specified, the command displays information only about object store configurations whose provider type matches the specified value.

[`-server <Remote InetAddress>`] - Fully Qualified Domain Name of the Object Store Server

If this parameter is specified, the command displays information only about object store configurations whose server name matches the specified value. The server name is specified as a Fully Qualified Domain Name (FQDN).

[`-is-ssl-enabled {true|false}`] - Is SSL/TLS Enabled

If this parameter is specified, the command displays information only about object store configurations whose status about the use of secured communication over the network matches the specified value.

[`-port <integer>`] - Port Number of the Object Store

If this parameter is specified, the command displays information only about object store configurations whose port numbers matches the specified value.

[`-container-name <text>`] - Data Bucket/Container Name Used in S3 Requests

If this parameter is specified, the command displays information only about object store configurations whose container name matches the specified value. Data ONTAP uses this container name or object store data bucket while accessing data from the object store.

[`-access-key <text>`] - Access Key ID for AWS_S3 and SGWS Provider Types

If this parameter is specified, the command displays information only about AWS S3 and SGWS object store configurations whose access key matches the specified value. Data ONTAP requires the access key for authorized access to the object store.

[`-azure-account <text>`] - Azure Account

If this parameter is specified, the command displays information only about Azure object store configurations whose account matches the specified value. Data ONTAP requires the Azure account for authorized access to the Azure object store.

[`-ipspace <IPspace>`] - IPspace to Use in Order to Reach the Object Store

If this parameter is specified, the command displays information only about object store configurations whose IPspace matches the specified value. Data ONTAP uses the IPspace value to connect to the object store.

[`-use-iam-role {true|false}`] - Use IAM Role for AWS ONTAP Cloud

If this parameter is specified, the command displays information only about object store configurations whose IAM role status flag matches the specified value. The `-iam-role` and `-use-iam-role` parameters are relevant only in the context of AWS object store and indicates whether IAM role must be used for accessing it. The IAM credentials can be obtained only through AWS Data ONTAP Cloud.

[`-iam-role <text>`] - IAM Role for AWS ONTAP Cloud

If this parameter is specified, the command displays information only about object store configurations whose IAM (Identity and Access Management) role matches the specified value.

[`-is-certificate-validation-enabled {true|false}`] - Is SSL/TLS Certificate Validation Enabled

If this parameter is specified, the command displays information only about object store configurations whose status about the validation of SSL/TLS certificate matches the specified value.

Examples

The following example displays all available object store configuration in the cluster:

```
cluster1::>storage aggregate object-store config show
```

storage aggregate object-store profiler commands

The profiler directory

storage aggregate object-store profiler abort

Abort Object Store Profiler

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage aggregate object-store profiler abort` command will abort an ongoing object store profiler run. This command requires two parameters - an object store configuration and a node on which the profiler is currently running.

Parameters

-node {<nodename>|local} - Node on Which the Profiler Should Run

This parameter specifies the node on which the object store profiler is running.

-object-store-name <text> - Object Store Configuration Name

This parameter specifies the object store configuration that describes the object store. The object store configuration has information about the object store server name, port, access credentials, and provider type.

Examples

The following example aborts the object store profiler :

```
cluster1::>storage aggregate object-store profiler abort -object-store-name my-store -node my-node
```

storage aggregate object-store profiler show

Show Object Store Profiler Status

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage aggregate object-store profiler show` command is used to monitor progress and results of the [“storage aggregate object-store profiler start” on page 816](#) command.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node Name

This parameter specifies the node on which the profiler was started.

[-object-store-name <text>] - ONTAP Name for this Object Store Config

This parameter specifies the object store configuration that describes the object store. The object store configuration has information about the object store server name, port, access credentials, and provider type.

`[-profiler-status <text>] - Profiler Status`

Current status of the profiler.

`[-start-time <MM/DD/YYYY HH:MM:SS>] - Profiler Start Time`

Time at which profiler run started.

`[-op-name <text>] - Operation Name - PUT/GET`

Name of the operation. Possible values are PUT or GET.

`[-op-size {<integer>[KB|MB|GB|TB|PB]}] - Size of Operation`

Size of the PUT or GET operation.

`[-op-count <integer>] - Number of Operations Performed`

Number of operations issued to the object store.

`[-op-failed <integer>] - Number of Operations Failed`

Number of operations that failed.

`[-op-latency-minimum <integer>] - Minimum Latency for Operation in Milliseconds`

Minimum latency of the operation in milliseconds, as measured from the filesystem layer.

`[-op-latency-maximum <integer>] - Maximum Latency for Operation in Milliseconds`

Maximum latency of the operation in milliseconds, as measured from the filesystem layer.

`[-op-latency-average <integer>] - Average Latency for Operation in Milliseconds`

Average latency of the operation in milliseconds, as measured from the filesystem layer.

`[-op-throughput {<integer>[KB|MB|GB|TB|PB]}] - Throughput per Second for the operation`

Throughput per second for the operation.

`[-op-errors <text>, ...] - Error Reasons and Count`

Error reasons and count for failed operation.

`[-op-latency-histogram <text>, ...] - Latency Histogram`

Latency histogram for the operation.

Examples

The following example displays the results of [“storage aggregate object-store profiler start” on page 816](#) :
`cluster1::>storage aggregate object-store profiler show`

storage aggregate object-store profiler start

Start the object store profiler to measure latency and throughput

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage aggregate object-store profiler start` command writes objects to an object store and reads those objects to measure latency and throughput of an object store. This command requires two parameters - an object store configuration and node from which to send the PUT/GET/DELETE operations. This command verifies whether the object store is accessible through the intercluster LIF of the node on which it runs. The command fails if the object store is not accessible. The command will create a 10GB dataset by doing 2500 PUTs for a maximum time period of 60 seconds. Then it will issue GET operations of different sizes - 4KB, 8KB, 32KB, 256KB for a maximum time period of 180 seconds. Finally it will delete the objects it created. This command can result in additional charges to your object store account. This is a CPU intensive command. It is recommended to run this command when the system is under 50% CPU utilization.

Parameters

-node <nodename>|local - Node on Which the Profiler Should Run

This parameter specifies the node from which PUT/GET/DELETE operations are sent.

-object-store-name <text> - Object Store Configuration Name

This parameter specifies the object store configuration that describes the object store. The object store configuration has information about the object store server name, port, access credentials, and provider type.

Examples

The following example starts the object store profiler :

```
cluster1::>storage aggregate object-store profiler start -object-store-name my-store -node my-node
```

storage aggregate plex commands

Manage storage aggregate plexes

The plex directory contains commands that operate on a plex of an aggregate.

storage aggregate plex delete

Delete a plex

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage aggregate plex delete` command deletes the specified plex. The aggregate specified with then `-aggregate` will be unmirrored and contain the remaining plex. The disks in the deleted plex become spare disks.

Parameters

-aggregate <aggregate name> - Aggregate

Name of an existing aggregate which contains the plex specified with the `-plex` parameter.

-plex <text> - Plex

Name of a plex which belongs to the aggregate specified with the `-aggregate` parameter.

Examples

The following example deletes plex0 of aggregate aggr1:

```
cluster1::> storage aggregate plex delete -aggregate aggr1 -plex plex0
```

storage aggregate plex offline

Offline a plex

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage aggregate plex offline` command takes the specified plex offline. The aggregate specified with the `-aggregate` parameter must be a mirrored aggregate and both plexes must be online. Prior to taking a plex offline, the system will flush all internally-buffered data associated with the plex and create a snapshot that is written out to both plexes. The snapshot allows for efficient resynchronization when the plex is subsequently brought back online.

Parameters

-aggregate <aggregate name> - Aggregate

Name of an existing aggregate which contains the plex specified with the `-plex` parameter.

-plex <text> - Plex

Name of a plex which belongs to the aggregate specified with the `-aggregate` parameter.

Examples

The following example takes plex0 of aggregate aggr1 offline:

```
cluster1::> storage aggregate plex offline -aggregate aggr1 -plex plex0
```

storage aggregate plex online

Online a plex

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage aggregate plex online` command brings the specified plex online. The aggregate specified with the `-aggregate` parameter must be an online mirrored aggregate. The system will initiate resynchronization of the plex as part of online processing.

Parameters

-aggregate <aggregate name> - Aggregate

Name of an existing aggregate which contains the plex specified with the `-plex` parameter.

-plex <text> - Plex

Name of a plex which belongs to the aggregate specified with the `-aggregate` parameter.

Examples

The following example brings plex0 of aggregate aggr1 online:

```
cluster1::> storage aggregate plex online -aggregate aggr1 -plex plex0
```

storage aggregate plex show

Show plex details

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage aggregate plex show` command displays information for the specified plex. By default, the command displays the following information about all plexes:

- Aggregate Name
- Plex Name
- Is Online
- Is Resyncing
- Resyncing Percentage
- Plex Status

To display detailed information about a single plex, use the `-aggregate` and `-plex` parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-aggregate <aggregate name>] - Aggregate

Name of an existing aggregate which contains the plex specified with the -plex parameter.

[-plex <text>] - Plex Name

Name of a plex which belongs to the aggregate specified with the -aggregate parameter.

[-status <text>] - Status

Displays plex status. Possible values are:

- *normal*
- *failed*
- *empty*
- *invalid*
- *uninitialized*
- *failed assimilation*
- *limbo*
- *active*
- *inactive*
- *resyncing*

These values may appear by themselves or in combination separated by commas, for example, "*normal, active*".

[-is-online {true|false}] - Is Online

Selects the plexes that match this parameter value.

[-in-progress {true|false}] - Resync is in Progress

Selects the plexes that match this parameter value.

[-resyncing-percent <percent>] - Resyncing Percentage

Selects the plexes that match this parameter value.

[-resync-level <integer>] - Resync Level

Selects the plexes that match this parameter value.

[-pool <integer>] - Pool

Selects the plexes that match this parameter value.

Examples

The following example displays information about all the plexes for all the aggregates:

```
cluster1::> storage aggregate plex show
```

Aggregate	Plex	Is Online	Is Resyncing	Resyncing Percent	Status
aggr0	plex0	true	false	-	normal,active
aggr1	plex0	true	false	-	normal,active
aggr1	plex1	true	false	-	normal,active
aggr2	plex0	true	false	-	normal,active
aggr2	plex2	true	false	-	normal,active

5 entries were displayed.

The following example displays information about plex1 of aggregate aggr1:

```
cluster1::> storage aggregate plex show -aggregate aggr1 -plex plex1
```

```
Aggregate: aggr1
Plex Name: plex1
Status: normal,active
Is Online: true
Resync is in Progress: false
Resyncing Percentage: -
Resync Level: -
Pool: 1
```

storage aggregate reallocation commands

Commands for optimizing freespace layout

storage aggregate reallocation quiesce

Quiesce reallocate job on aggregate

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Temporarily stops any reallocation jobs that are in progress. When you use this command, the persistent state is saved. You can use the [“storage aggregate reallocation restart” on page 820](#) command to restart a job that is quiesced.

There is no limit to how long a job can remain in the quiesced (paused) state.

Parameters

-aggregate <aggregate name> - Aggregate Name

Specifies the aggregate on which you want to temporarily pause the job.

Examples

```
cluster1::> storage aggregate reallocation quiesce
  -aggregate aggr0
```

storage aggregate reallocation restart

Restart reallocate job on aggregate

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Starts a reallocation job. Use this command to restart a quiesced (temporarily stopped) job or a scheduled scan that is idle for the aggregate.

Parameters

-aggregate <aggregate name> - Aggregate Name

Specifies the aggregate on which you want to restart reallocation scans.

[-ignore-checkpoint | -i [true]] - Ignore Checkpoint

Restarts the job at the beginning when set to true. If you use this command without specifying this parameter, its effective value is false and the job starts the scan at the point where it was stopped. If you specify this parameter without a value, it is set to true and the scan restarts at the beginning.

Examples

```
cluster1::> storage aggregate reallocation restart
            -aggregate aggr0 -ignore-checkpoint true
```

storage aggregate reallocation schedule

Modify schedule of reallocate job on aggregate

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Schedules a reallocation scan for an existing reallocation job. If the reallocation job does not exist, use the [“storage aggregate reallocation start” on page 822](#) command to define a reallocation job.

You can delete an existing reallocation scan schedule. However, if you do this, the job's scan interval reverts to the schedule that was defined for it when the job was created with the [“storage aggregate reallocation start” on page 822](#) command.

Parameters

-aggregate <aggregate name> - Aggregate Name

Specifies the aggregate on which you want to schedule reallocation jobs.

[-del | -d [true]] - Delete

Deletes an existing reallocation schedule when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation schedule is not deleted. If you specify this parameter without a value, it is set to true and the reallocation schedule is deleted.

[-cron | -s <text>] - Cron Schedule

Specifies the schedule with the following four fields in sequence. Use a space between field values. Enclose the values in double quotes.

- minute is a value from 0 to 59.
- hour is a value from 0 (midnight) to 23 (11:00 p.m.).
- day of week is a value from 0 (Sunday) to 6 (Saturday).
- day of month is a value from 1 to 31.

Note: If you specify 31 as the value for the day of month, reallocation scans will not run in any months with fewer than 31 days.

Use an asterisk "*" as a wildcard to indicate every value for that field. For example, an * in the day of month field means every day of the month. You cannot use the wildcard in the minute field.

You can enter a number, a range, or a comma-separated list of values for a field.

Examples

```
cluster1::> storage aggregate reallocation schedule -aggregate aggr0 -cron "0 23 6 *"
```

storage aggregate reallocation show

Show reallocate job status for improving free space layout

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Displays the status of a reallocation scan, including the state, schedule, aggregate and scan id. If you do not specify the id for a particular reallocation scan, the command displays information about all the existing reallocation scans.

Parameters

{ **[-fields <fieldname>, ...]**

Displays the value of relevant field that you specify for the reallocation scans that are present.

| **[-v]**

Specify this parameter to display the output in a verbose format.

| **[-instance]**

Displays information about reallocation scans on aggregates in a list format.

[-id <integer>] - Job ID

Specify this parameter to display the reallocation scan that matches the reallocation job ID that you specify.

[-aggregate <aggregate name>] - Aggregate Name

Specify this parameter to display the reallocation scan that matches the aggregate that you specify.

[-description <text>] - Job Description

Specify this parameter to display reallocation scans that match the text description that you specify.

[-state {Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - Job State

Specify this parameter to display reallocation jobs that match the state that you specify.

[-progress <text>] - Execution Progress

Specify this parameter to list the running reallocation jobs whose progress indicator matches the text that you provide. For example, if you specify "Starting ..." as the text string for the progress option, then the system lists all the jobs that are starting.

[-schedule <job_schedule>] - Schedule Name

Specify this parameter to display reallocation scans that match the schedule name that you specify. If you want a list of all job schedules, use the ["job schedule show" on page 178](#) command.

[-global-status <text>] - Global State of Scans

Specify this parameter to indicate if reallocation scans are on or off globally. You must type either of the following text strings:

- "Reallocation scans are on"
- "Reallocation scans are off"

Examples

```
cluster1::> storage aggregate reallocation show
Job ID      Aggregate      Schedule      State
-----
23          aggr0          reallocate_0 23 * 6      Queued
```

storage aggregate reallocation start

Start reallocate job on aggregate

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Begins a reallocation scan on a specified aggregate.

Before performing a reallocation scan, the reallocation job normally performs a check of the current layout optimization. If the current layout optimization is less than the threshold, then the system does not perform a reallocation on the aggregate.

You can define the reallocation scan job so that it runs at a specific interval, or you can use the [“storage aggregate reallocation schedule” on page 821](#) command to schedule reallocation jobs.

Parameters

-aggregate <aggregate name> - Aggregate Name

Specify this parameter to specify the target aggregate on which to start a reallocation scan.

{ [-interval | -i <text>] - Interval Schedule

Specified the schedule in a single string with four fields:

- minute is a value from 0 to 59.
- hour is a value from 0 (midnight) to 23 (11:00 p.m.).
- day of month is a value from 1 to 31.

Note: If you specify 31 as the value for the day of the month, reallocation scans will not run in any of the months with fewer than 31 days.

- day of the week is a value from 0 (Sunday) to 6 (Saturday).

Use an asterisk "*" as a wildcard to indicate every value for that field. For example, an * in the day of month field means every day of the month. You cannot use the wildcard in the minute field.

You can enter a number, a range, or a comma-separated list of values for a field.

| [-once | -o [true]] - Once

Specifies that the job runs once and then is automatically removed from the system when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation scan runs as scheduled. If you enter this parameter without a value, it is set to true and a reallocation scan runs once.

Examples

```
cluster1::> storage aggregate reallocation start -aggregate aggr0 -interval "0 23 * 6"
```

storage aggregate reallocation stop

Stop reallocate job on aggregate

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Stops and deletes any reallocation scan running on the specified aggregate. This command stops and deletes in-progress, scheduled, and quiesced scans.

Parameters

-aggregate <aggregate name> - Aggregate Name

Specify this parameter to specify the target aggregate on which to stop and delete a reallocation scan.

Examples

```
cluster1::> storage aggregate reallocation stop -aggregate aggr0
```

Storage Aggregate Relocation Commands

Manage aggregate relocation

The `storage aggregate relocation` commands enable you to relocate aggregates from one node to another node in the same cluster that share storage.

storage aggregate relocation show

Display relocation status of an aggregate

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage aggregate relocation show` command displays status of aggregates which were relocated in the last instance of relocation operation.

Parameters

[`-fields <fieldname>, ...`]

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

[`-instance ]`]

If you specify the `-instance` parameter, the command displays detailed information about all entries.

[`-node {<nodename>|local}`]} - Node

Selects aggregates from the specified source node.

[`-aggregate <text>`] - Aggregate Name

Selects the aggregates that match this parameter value.

[`-relocation-status <text>`] - Aggregates Relocation Status

Selects the aggregates whose relocation status matches this parameter value.

[`-destination <text>`] - Destination for Relocation

Selects the aggregates that are designated for relocation on the specified destination node.

Examples

The following example displays the relocation status of aggregates on all nodes in the cluster:

```
cluster1::> storage aggregate relocation show
Source      Aggregate  Destination  Relocation Status
-----
node0
-           -           -           Not attempted yet
node1
aggr1       node0      Done
aggr2       node0      In progress
aggr3       node0      Not attempted yet
4 entries were displayed.
```

storage aggregate relocation start

Relocate aggregates to the specified destination

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage aggregate relocation start` command initiates the relocation of the aggregates from one node to the partner node in a high-availability (HA) pair.

Parameters

-node {<nodename>|local} - Name of the Node that currently owns the aggregate

This specifies the source node where the aggregates to be relocated reside.

-destination {<nodename>|local} - Destination node

This specifies the destination node where aggregates are to be relocated.

-aggregate-list <aggregate name>, ... - List of Aggregates to be relocated

This specifies the list of aggregate names to be relocated from source node to destination node.

[-override-vetoes {true|false}] - Override Vetoes

This specifies whether to override the veto checks for relocation operation. Initiating aggregate relocation with vetoes overridden will result in relocation proceeding even if the node detects outstanding issues that would make aggregate relocation dangerous or disruptive. The default value is false.

[-relocate-to-higher-version {true|false}] - Relocate To Higher Version

This specifies if the aggregates are to be relocated to a node which is running on a higher version of Data ONTAP than the source node. If an aggregate is relocated to this destination then that aggregate cannot be relocated back to the source node till the source is also upgraded to the same or higher Data ONTAP version. This option is not required if the destination node is running on higher minor version, but the same major version. The default value is false.

[-override-destination-checks {true|false}] - Override Destination Checks

This specifies if the relocation operation should override the check done on destination node. This option could be used to force a relocation of aggregates even if the destination has outstanding issues. Note that this could make the relocation dangerous or disruptive. The default value is false.

[-ndo-controller-upgrade {true|false}] - Relocate Aggregates for NDO Controller Upgrade (privilege: advanced)

This specifies if the relocation operation is being done as a part of non-disruptive controller upgrade process. Aggregate relocation will not change the home ownerships of the aggregates while relocating as part of controller upgrade. The default value is false.

Examples

The following example relocates aggregates name aggr1 and aggr2 from source node node0 to destination node node1:

```
cluster1::> storage aggregate relocation start -node node0 -destination node1 -aggregate-list aggr1, aggr2
```

Storage Aggregate Resynchronization Commands

Manage aggregate resynchronization priorities and options

The `storage aggregate resynchronization` command family manages the number and the order of aggregates that can start a resynchronization operation at any given time on a node. On SyncMirror enabled nodes, plexes of mirrored aggregates can go offline because of a variety of issues. When the disks of an offlined plex come back online, we start a background resynchronization operation on the aggregate to make sure that the new plex is up to date again. These commands allow the user to control the number of resynchronization operations that can concurrently execute on a node, as well as the order in which the aggregates are picked for the resynchronization operation. On a node containing multiple data aggregates, the resynchronization of critical data aggregates can be prioritized by assigning a higher `resync-priority` value than the rest of the data aggregates.

The [“storage aggregate resynchronization options” on page 827](#) commands can be used to control the volume of background resynchronization I/O on a node after a storage or network outage by limiting the number of aggregates that can resynchronize at the same time on a node.

storage aggregate resynchronization modify

Modify aggregate resynchronization priorities

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage aggregate resynchronization modify` command can be used to modify the resynchronization priority of an aggregate.

When the number of aggregates pending resynchronization is higher than the maximum number of concurrent resynchronization operations allowed on a node, the aggregates get resynchronized in the order of their "resync-priority" values.

For example, let the `max-concurrent-resync` under the ["storage aggregate resynchronization options" on page 827](#) directory for a node be set to two. If there are three aggregates waiting to be resynchronized, where their respective `resync-priority` values are high, medium, and low, then the third aggregate is not allowed to start resynchronization until one of the first two aggregates has completed resynchronizing.

Parameters

-aggregate <aggregate name> - Aggregate

This parameter specifies the aggregate that is to be modified.

[-resync-priority {high(fixed)|high|medium|low}] - Resynchronization Priority

This parameter specifies the new resynchronization priority value for the specified aggregate. This field cannot be modified for unmirrored or Data ONTAP system aggregates.

Possible values for this parameter are:

- high: Mirrored data aggregates with this priority value start resynchronization first.
- medium: Mirrored data aggregates with this priority value start resynchronization after all the system aggregates and data aggregates with 'high' priority value have started resynchronization.
- low: Mirrored data aggregates with this priority value start resynchronization only after all the other aggregates have started resynchronization.

Examples

The following example changes the `resync-priority` of a specified aggregate to `medium`:

```
cluster1::> storage aggregate resynchronization modify -aggregate aggr1 -resync-priority medium
```

storage aggregate resynchronization show

Display aggregate resynchronization priorities

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage aggregate resynchronization show` command displays the relative resynchronization priority for each aggregate in the cluster. When a particular node restricts how many resync operations can be active concurrently, these priorities are used to prioritize the operations. The maximum concurrent resync operations for a node is displayed in the ["storage aggregate resynchronization options show" on page 828](#) command. If no parameters are specified, the command displays the following information about all the aggregates in the cluster:

- Aggregate name

- Node that owns the aggregate
- Resync priority for the aggregate

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-aggregate <aggregate name>] - Aggregate

If this parameter is specified, the command displays the resynchronization priority only for the specified aggregate.

[-node {<nodename>|local}] - Node

If this parameter is specified, the command displays the resynchronization priority only for the aggregates owned by the specified node.

[-resync-priority {high(fixed)|high|medium|low}] - Resynchronization Priority

If this parameter is specified, the command displays only the resynchronization priority that matches the specified value. Possible values for this parameter are:

- high(fixed): This value is reserved for Data ONTAP system aggregates, which cannot have any other value for this field. These aggregates always start their resynchronization operation at the first available opportunity. This value cannot be assigned to a data aggregate.
- high: Mirrored data aggregates with this priority value start resynchronization first.
- medium: Mirrored data aggregates with this priority value start resynchronization after all the system aggregates and data aggregates with 'high' priority value have started resynchronization.
- low: Mirrored data aggregates with this priority value start resynchronization only after all the other aggregates have started resynchronization.

When the number of aggregates waiting for resynchronization is higher than the maximum number of resynchronization operations allowed on a node, then the resync-priority field is used to determine which aggregate starts resynchronization first. This field is not set for unmirrored aggregates.

Examples

The following command displays the resynchronization priorities for all the aggregates in the cluster:

```
cluster1::> storage aggregate resynchronization show
Aggregate Node           Resync Priority
-----
aggr0_n1  cluster1-01          high(fixed)
aggr0_n2  cluster1-02          high(fixed)
aggr1     cluster1-01           low
aggr2     cluster1-01          high
aggr3     cluster1-01          medium
4 entries were displayed.
```

storage aggregate resynchronization options commands

The options directory

storage aggregate resynchronization options modify

Modify node specific aggregate resynchronization options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage aggregate resynchronization options modify` command can be used to modify the options that govern the resynchronization of aggregates on a given cluster node.

Modifying the `max-concurrent-resyncs` option changes the number of aggregates that are allowed to resynchronize concurrently. When the number of aggregates waiting for resynchronization is higher than this value, the aggregates are resynchronized in the order of their "resync-priority". This value can be modified using the [“storage aggregate resynchronization modify” on page 826](#) command while specifying the `-resync-priority` parameter.

Parameters

-node {<nodename>|local} - Node

This parameter specifies the node for which the option is to be modified.

[-max-concurrent-resync <integer>] - Maximum Concurrent Resynchronizing Aggregates

This parameter specifies the new value for the maximum number of concurrent resync operations allowed on a node. This option must be specified along with the `-node` parameter. When a node has active resync operations, setting this parameter to a value that is lower than the number of currently resyncing aggregates will trigger a user confirmation.

Examples

The following example changes the maximum concurrent resync operations for the specified node to ten:

```
cluster1::> storage aggregate resynchronization options modify -node node1 -max-concurrent-resyncs 10
```

storage aggregate resynchronization options show

Display node specific aggregate resynchronization options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage aggregate resynchronization options show` command displays all the options that govern the resynchronization of aggregates on a given cluster node. If no parameters are specified, the command displays the following information about all nodes:

- Node for which the information is being displayed
- Maximum number of concurrent resynchronizing aggregates allowed

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

If this parameter is specified, the command displays resynchronization options only for the specified node.

[-max-concurrent-resync <integer>] - Maximum Concurrent Resynchronizing Aggregates

If this parameter is specified, the command displays only the resynchronization option that matches the specified value.

Examples

The following example displays the maximum number of concurrent resyncs allowed for each node in the cluster:

```
cluster1::> storage aggregate resynchronization options show
Node           Maximum Concurrent Resynchronizing Aggregates
-----
cluster1-01    15
cluster1-02     4
2 entries were displayed.
```

The following example displays the maximum number of concurrent resyncs allowed for a specified node:

```
cluster1::> storage aggregate resynchronization options show -node node1
Node           Maximum Concurrent Resynchronizing Aggregates
-----
cluster1-01    15
```

The following example displays all the nodes that allow more than five concurrent resync operations:

```
cluster1::> storage aggregate resynchronization options show -max-concurrent-resyncs >5
Node           Maximum Concurrent Resynchronizing Aggregates
-----
cluster1-01    15
```

storage array commands

The array directory

storage array modify

Make changes to an array's profile.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage array modify` command lets the user change several array parameters.

Parameters

-name <text> - Name

Storage array name, either generated by Data ONTAP or assigned by the user.

[-prefix <text>] - Prefix

Abbreviation for the named array.

[-vendor <text>] - Vendor

Array manufacturer.

[-model <text>] - Model

Array model number.

[-options <text>] - options

Vendor specific array settings.

[-max-queue-depth <integer>] - Target Port Queue Depth (privilege: advanced)

The target port queue depth for all target ports on this array.

[-lun-queue-depth <integer>] - LUN Queue Depth (privilege: advanced)

The queue depth assigned to array LUNs from this array.

{ [-is-upgrade-pending {true|false}] - Upgrade Pending (privilege: advanced)

Set this parameter to *true* if the array requires additional Data ONTAP resilience for a pending firmware upgrade. Keep this parameter *false* during normal array operation. This value can not be set to *true* if *-path-failover-time* is greater than zero.

| [-path-failover-time <integer>] - Path Failover Time (sec)

The time delay (in secs) before switching the I/O path when the path is deleted. The maximum time delay is 30 sec. The default is 0. This value can not be greater than zero if *-is-upgrade-pending* is *true*.

[-all-path-fail-delay <integer>]] - Extend All Path Failure Event (secs)

Use this parameter to increase the delay before Data ONTAP declares an "all path failure" event for an array. Delaying the "all path failure" event allows Data ONTAP to suspend I/O operations for a longer period of time before declaring a data access disruption, allowing for I/O operations to resume if any path comes back online within the specified duration. A valid delay is any value between 30 and 90 seconds. A value of 0 will reset the delay, resulting in default actions being taken whenever an "all path failure" event is detected.

Examples

This command changes the model to FastT.

```
cluster1::> storage array modify -name IBM_1722_1 -model FastT
```

storage array remove

Remove a storage array record from the array profile database.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage array remove` command discards array profile records for a particular storage array from the cluster database. Upon command completion, if a storage array is still connected to the cluster, the array profile record is re-created with default values.

Parameters

-name <text> - Name

Name of the storage array you want to remove from the database.

Examples

```
cluster1::> storage array remove IBM_1722_1
```

storage array rename

Change the name of a storage array in the array profile database.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage array rename` command permits substitution of the array profile name which Data ONTAP assigned during device discovery. By default, the name that Data ONTAP assigned to the storage array during discovery is shown in Data ONTAP displays and command output.

Parameters

-name <text> - Name

Storage array name either generated by Data ONTAP or assigned by the user.

-new-name <text> - The new name to assign to this array profile. (28 chars max)

New name to assign to the storage array.

Examples

```
cluster1::> storage array rename -name HITACHI_DF600F_1 -new-name MyArray
```

storage array show

Display information about SAN-attached storage arrays.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage array show` command displays information about arrays visible to the cluster. If no parameters are specified, the command displays the following information about all storage arrays:

- Prefix
- Name
- Vendor
- Model
- Options

To display detailed information about a single array, use the `-name` parameter. The detailed view adds the following information:

- Serial Number
- Optimization Policy
- Affinity
- Errors
- Path Failover Time
- Extend All Path Failure Event

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-name <text>] - Name

Selects the arrays that match this parameter value.

[-prefix <text>] - Prefix

Abbreviation for the named array.

[-vendor <text>] - Vendor

Array manufacturer.

[-model <text>] - Model

Array model number.

[-options <text>] - options

Vendor specific array settings.

[-serial-number <text>] - Serial Number

Array product identifier.

[-max-queue-depth <integer>] - Target Port Queue Depth (privilege: advanced)

Selects the arrays that match this parameter value.

[-lun-queue-depth <integer>] - LUN Queue Depth (privilege: advanced)

Selects the arrays that match this parameter value.

[-optimization-policy {iALUA|eALUA|symmetric|proprietary|mixed|unknown}] - Optimization Policy

Selects the arrays that match this parameter value.

[-affinity {none|aaa|ap|mixed|unknown}] - Affinity

Selects the arrays that match this parameter value.

[-error-text <text>, ...] - Error Text

Selects the arrays that match this parameter value.

[-is-upgrade-pending {true|false}] - Upgrade Pending (privilege: advanced)

Selects the arrays that match this parameter value.

[-path-failover-time <integer>] - Path Failover Time (sec)

Use this parameter to list arrays that have path failover time set to the value you specify.

[-all-path-fail-delay <integer>] - Extend All Path Failure Event (secs)

Use this parameter to list arrays that have the all path failure event delay set to the value you specify.

Examples

The following example displays information about all arrays.

```
cluster1::> storage array show
Prefix      Name      Vendor      Model Options
-----
                HITACHI_DF600F_1  HITACHI      DF600F
                IBM_1722_1      IBM          1722
2 entries were displayed.
```

The following example displays detailed information about a specific array:

```
cluster1::> storage array show -name HITACHI_DF600F_1
Name: HITACHI_DF600F_1
Prefix: abc
Vendor: HITACHI
Model: DF600F
options:
  Serial Number: 4291000000000000
  Optimization Policy: iALUA
  Affinity: aaa
  Error Text:
  Path Failover Timeout (sec): 30
  Extend All Path Failure Event (secs): 50
```

storage array config commands

The config directory

storage array config show

Display connectivity to back-end storage arrays.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage array config show` command displays information about how the storage arrays connect to the cluster, LUN groups, number of LUNS, and more. Use this command to validate the configuration and to assist in troubleshooting.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-switch]

If you specify this parameter, switch port information is shown.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Controller Name

Selects the arrays that match this parameter value.

[-group <integer>] - LUN Group

Selects the arrays that match this parameter value. A LUN group is a set of LUNs that shares the same path set.

[-target-wwpn <text>] - Array Target Ports

Selects the arrays that match this parameter value (the World Wide Port Name of a storage array port).

[-initiator <text>] - Initiator

Selects the arrays that match this parameter value (the host bus adapter that the clustered node uses to connect to storage arrays).

[-array-name <array name>] - Array Name

Selects the arrays that match this parameter value.

[-target-side-switch-port <text>] - Target Side Switch Port

Selects the arrays that match this parameter value.

[-initiator-side-switch-port <text>] - Initiator Side Switch Port

Selects the arrays that match this parameter value.

[-lun-count <integer>] - Number of array LUNs

Selects the arrays that match this parameter value.

[-ownership {all|assigned|unassigned}] - Ownership

Selects the arrays that match this parameter value.

Examples

```
cluster1::> storage array config show
```

Node	LUN Group	LUN Count	Array Name	Array Target Port	Initiator

storage array disk commands

The storage array disk directory

storage array disk paths commands

The paths directory

storage array disk paths show

Display a list of LUNs on the given array

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage array disk paths show` command displays information about disks and array LUNs. Where it appears in the remainder of this document, "disk" may refer to either a disk or an array LUN. By default, the command displays the following information about all disks:

- Disk Unique Identifier
- Controller name
- Initiator Port
- LUN ID
- Failover optimization type
- The Use State of the LUN on this path
- Target Port
- Target IQN
- TPGN
- Port speeds
- Kbytes/sec on Disk (Rolling Average)
- Number IOPS per second on disk (Rolling Average)

To display detailed information about a single disk, use the `-disk` parameter.

Parameters

{ [-fields <fieldname>, ...]

Displays the specified fields for all disks, in column style output.

| [-switch]

Displays the switch port information for all disks, in column style output.

| [-instance]}

Displays detailed disk information. If no disk path name is specified, this parameter displays the same detailed information for all disks as does the `-disk` parameter. If a disk path name is specified, then this parameter displays the same detailed information for the specified disks as does the `-disk` parameter.

[-uid <text>] - Disk Unique Identifier

Selects the disks whose unique id matches this parameter value. A disk unique identifier has the form:
20000000:875D4C32:00000000:00000000:00000000:00000000:00000000:00000000:00000000

[-disk <disk path name>] - Disk Name

Displays detailed information about the specified disks.

[-array-name <array name>] - Array Name

Selects information about the LUNs presented by the specified storage array.

[-diskpathnames <disk path name>, ...] - Path-Based Disk Names

Selects information about disks that have all of the specified path names.

[-nodelist [<nodename>|local], ...] - Controller name

Selects information about disks that are visible to all of the specified nodes .

[-initiator <text>, ...] - Initiator Port

Selects information about disks that are visible to the initiator specified. Disks that are not currently in use by that initiator are included.

[-lun <integer>, ...] - LUN ID

Selects information about the specified LUNs.

[-target-wwpn <text>, ...] - Target Port

Selects information about disks that are visible on target ports identified by their World Wide Port Name.

[-initiator-side-switch-port <text>, ...] - Initiator Side Switch Port

Selects information about disks visible to an initiator that is connected to the specified switch port.

[-lun-path-use-state <text>, ...] - The Use State of the LUN on this path

Selects information about LUNs reporting the specified in-use state.

[-tpgn <integer>, ...] - Target Port Group Number

Selects information about disks that belong to the specified Target Port Group Number.

[-port-speed <text>, ...] - Port Speed

Selects information about disks served by a Host Bus Adapter that is running at the specified port speed.

[-lun-io-kbps <integer>, ...] - Kbytes/sec on Disk (Rolling Average)

Selects information about the LUNs that have reached the specified I/O throughput.

[-lun-iops <integer>, ...] - Number IOPS per second on disk (Rolling Average)

Selects information about the LUNs that have reached the specified number of IOPs.

[-target-side-switch-port <text>, ...] - Target Side Switch Port

Selects information about disks that are visible on target ports identified by the switch port to which they are connected.

[-target-port-access-state <text>, ...] - Failover optimization type

Selects information about disks visible on target ports that have the specified access state.

[-initiator-io-kbps <integer>, ...] - Kbytes of I/O per second on Initiator (Rolling Average)

Selects information about disks visible to an initiator that has executed I/O at the specified throughput.

[-initiator-iops <integer>, ...] - Number of IOPS on Initiator (Rolling Average)

Selects information about disks visible to an initiator that has executed the specified number of IOPs.

[-target-io-kbps <integer>, ...] - Kbytes of I/O per second to Target (Rolling Average)

Selects information about disks visible on target ports that have reached the specified I/O throughput.

[-target-iops <integer>, ...] - Number of IOPS to Target (Rolling Average)

Selects information about disks visible on target ports that have performed the specified number of IOPs.

[-path-link-errors <integer>, ...] - Link Error count on path

Selects information about disks with paths that have incurred the specified number of FC link errors.

[-path-io-kbps <integer>, ...] - Kbytes of I/O per second on Path (Rolling Average)

Selects information about disk with paths that have reached the specified I/O throughput.

[-path-iops <integer>, ...] - Number of IOPS on Path (Rolling Average)

Selects information about disks on those paths that have reached the specified number of IOPs.

[-path-quality <integer>, ...] - Percentage of weighted error threshold

Selects information about disks on paths that have incurred the specified number of errors. The value displayed is a measure of the health of a path expressed as a percentage of an error threshold. Once a path has reached or surpassed the error threshold, another path will be selected for I/O transfer, if there is one available.

[-path-lun-in-use-count <integer>, ...] - Number of LUNs in the in-use state on this path

Selects information about disks with paths that have the specified in-use-count.

[-initiator-lun-in-use-count <integer>, ...] - Number of LUNs in the in-use state on this initiator

Selects information about disks with a path through an initiator that has the specified in-use-count.

[-target-lun-in-use-count <integer>, ...] - Number of LUNs in the in-use state on this target

Selects information about disks with a path through a target port that has the specified in-use-count.

[-preferred-target-port {true|false}, ...] - Whether or not target port group is preferred

Selects information about disks that match the specified parameter value indicating whether the backing storage is ALUA (Assymmetric Logical Unit Access) capable and has specified the array target port on this path to be a preferred target port for I/O.

[-vmdisk-device-id <integer>, ...] - Virtual disk device ID

Selects information about disks that have the specified virtual disk device ID.

[-host-adapter <text>] - Primary Path Host Adapter

Selects information about disks that are currently using the specified Host Bus Adapter.

[-primary-port <text>] - Primary Path Disk Port

Selects information about disks that use the specified primary port.

[-secondary-name <disk path name>] - Secondary Path Name

Selects information about disks that use the specified secondary path name, for multipath configuration.

[-secondary-port <text>] - Secondary Path Disk Port

Selects information about disks that use the specified secondary port.

Examples

The following example displays information about all disks:

```
cluster1::> storage array disk paths show
Disk Name: 1.0.20
```

```

UID: 5000C500:0979E09F:00000000:00000000:00000000:00000000:00000000:00000000

storage array port commands

The port directory

storage array port modify

Make changes to a target port record.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage array port modify` command lets the user change array target port parameters.

Parameters

-name <text> - Name

Selects the array ports that match this parameter value. The storage array name is either generated by Data ONTAP or assigned by the user.

-wwnn <text> - WWNN

Selects the array ports that match this parameter value.

-wwpn <text> - WWPN

Selects the array ports that match this parameter value.

[-max-queue-depth <integer>] - Target Port Queue Depth

The target port queue depth for this target port.

[-utilization-policy {normal|defer}] - Utilization Policy

The policy used in automatically adjusting the queue depth of the target port based on its utilization.

Examples

This command changes the maximum queue depth for this target port to 32.

```
cluster1::> storage array port modify -name HITACHI_DF600F_1 -wwnn 50060e80004291c0 -wwpn 50060e80004291c0 -max-queue-depth 32
```

storage array port remove

Remove a port record from an array profile.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage array port remove` command removes a port from the array database. You might want to remove ports that are no longer connected to the clustered node. Port information can change after hardware replacement, rezoning, or similar configuration activities. The database retains the records about previous ports unless you remove the information.

Parameters

-name <text> - Name

Selects the array ports that match this parameter value. The storage array name is either generated by Data ONTAP or assigned by the user.

{ [-wwnn <text>] - WWNN

Selects the array ports that match this parameter value.

[-wwpn <text>] - WWPN

Selects the array ports that match this parameter value.

| [-target-iqn <text>] - Target IQN

Selects the array ports that match this parameter value.

[-tpgt <integer>] - TPGT

Selects the array ports that match this parameter value.

Examples

This command removes a port record from the array profiles database.

```
cluster1::> storage array port remove -name HITACHI_DF600F_1 -wwnn 50060e80004291c0 -wwpn 50060e80004291c0
```

storage array port show

Display information about a storage array's target ports.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage array port show` command displays all the target ports known to the cluster for a given storage array (if an array name is specified) or for all storage arrays if no storage array name is specified. Target ports remain in the database as part of an array profile unless you explicitly remove them from the database.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-name <text>] - Name

Selects the array ports that match this parameter value. The storage array name is either generated by Data ONTAP or assigned by the user.

[-wwnn <text>] - WWNN

Selects the array ports that match this parameter value.

[-wwpn <text>] - WWPN

Selects the array ports that match this parameter value.

[-max-queue-depth <integer>] - Target Port Queue Depth

Selects the array ports that match this parameter value.

[-node {<nodename>|local}, ...] - Controller Name

Selects the array ports that match this parameter value.

[-initiator-port <text>, ...] - Initiator Port

Selects the array ports that match this parameter value.

[-average-dynamic-queue-depth <integer>, ...] - Average Dynamic Queue Depth (privilege: advanced)

The average value of the dynamic target port queue depth.

[-average-latency-per-iop <integer>, ...] - Average Latency Per IOP

Selects the array ports that match this parameter value (average latency per I/O performed in microseconds).

[-average-pending <integer>, ...] - Average Pending (privilege: advanced)

Selects the array ports that match this parameter value (average over time of how many commands are on the outstanding queue).

[-average-waiting <integer>, ...] - Average Waiting (privilege: advanced)

Selects the array ports that match this parameter value (average over time of how many commands are on the waiting queue).

[-connection-type {direct|fabric|ISCSI}] - Connection Type

Selects the array ports that match this parameter value (type of connection between the controller and the back end storage).

[-dynamic-queue-depth <integer>, ...] - Dynamic Queue Depth (privilege: advanced)

Current dynamic target port queue depth, the maximum number of commands allowed outstanding.

[-max-pending <integer>, ...] - Max Pending (privilege: advanced)

Selects the array ports that match this parameter value (largest number of commands observed on the outstanding queue).

[-max-waiting <integer>, ...] - Max Waiting (privilege: advanced)

Selects the array ports that match this parameter value (largest number of commands observed on the waiting queue).

[-path-link-errors <integer>, ...] - Link Error count on path

Selects the array ports that match this parameter value.

[-percent-busy <integer>, ...] - Percent Busy

Selects the array ports that match this parameter value (percentage of time I/Os are outstanding on the port).

[-percent-waiting <integer>, ...] - Percent Waiting

Selects the array ports that match this parameter value (percentage of time there are I/Os waiting on the throttle list on the target port).

[-switch-port <text>] - Switch Port

Selects the array ports that match this parameter value (for fabric attached connections, the switch port the array target port is connected to; N/A for direct attached).

[-target-io-kbps <integer>, ...] - Kbytes of I/O per second to Target (Rolling Average)

Selects the array ports that match this parameter value.

[-target-iops <integer>, ...] - Number of IOPS to Target (Rolling Average)

Selects the array ports that match this parameter value.

[-target-lun-in-use-count <integer>, ...] - Target LUN In Use Count

Selects the array ports that match this parameter value (number of IN-USE disks on this target port).

[-target-port-speed <text>] - Target Port Speed

Selects the array ports that match this parameter value (speed that the target port has negotiated with its connected switch port, or initiator port if direct attached).

[-utilization-policy {normal|defer}] - Utilization Policy

The policy used when sending I/O to an array target port when it reaches maximum queue depth.

Possible values are:

- normal - This policy aggressively competes for target port resources, in effect competing with other hosts. (default)
- defer - This policy does not aggressively compete for target port resources, in effect deferring to other hosts.

Examples

The example below displays the port information for a single port.

```
cluster1::> storage array port show -wwpn 50060e80004291c0
Array Name: HITACHI_DF600F_1
WWNN: 50060e80004291c0
WWPN: 50060e80004291c0
Connection Type: fabric
Switch Port: vgbr300s89:9
Link Speed: 4 GB/s
Max Queue Depth: 1024
Utilization Policy: normal
```

Node	Initiator	LUN Count	IOPS	KB/s	%busy	%waiting	Link Errs
vnv3070f20a	0b	2	0	0	0	0	0
vnv3070f20b	0b	2	0	0	0	0	0

storage automated-working-set-analyzer commands

Manage Automated Working Set Analyser

storage automated-working-set-analyzer show

Display running instances

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The automated-working-set-analyzer show command displays the Automated Working-set Analyzer running instances.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| **[-instance]**

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node Name

This parameter indicates the node name that the AWA instance runs on.

[-flash-cache {true|false}] - Flash Cache Node-wide Modeling

This parameter indicates whether the AWA is modeling flash-cache.

[-aggregate-uuid <UUID>] - Uuid of the Aggregate

This parameter indicates the aggregate uuid that the AWA instance runs on.

[-aggregate <aggregate name>] - Aggregate

This parameter indicates the aggregate name that the AWA instance runs on.

[-working-set-size {true|false}] - Working Set Size

This parameter indicates whether the AWA instance is configured to find the working set size.

[-start-time <Date>] - Starting Time

This parameter indicates the time when the AWA instance was started.

[-total-intervals <integer>] - Total Interval Count

This parameter indicates the total number of intervals that the AWA instance has covered.

[-read-throughput {<integer>[Bps|KBps|MBps|GBps]] - Read Throughput

This parameter indicates the maximum read throughput over an interval that AWA has observed from the storage disks.

[-write-throughput {<integer>[Bps|KBps|MBps|GBps]] - Write Throughput

This parameter indicates the maximum write throughput over an interval that AWA has observed to the storage disks

[-cacheable-read <percent>] - Cacheable Read

This parameter indicates the maximum percent of cacheable read over an interval that AWA has observed. Cacheable reads are non-sequential reads, i.e., the percentage of data reads that could have been cached.

[-cacheable-write <percent>] - Cacheable Write

This parameter indicates the maximum percent of cacheable write over an interval that AWA has observed. Cacheable writes are random overwrites, percentage of disk writes that could have been cached.

[-projected-cache-size {<integer>[KB|MB|GB|TB|PB]] - Max Projected Cache Size

This parameter indicates the projected Flash Pool cache usage.

[-projected-read-hit <percent>] - Projected Read Hit

This parameter indicates the percentage of blocks that could be read from the Flash Pool cache instead of HDDs.

[-projected-write-hit <percent>] - Projected Write Hit

This parameter indicates the percentage of block overwrites that could go to the Flash Pool cache instead of HDDs.

[-referenced-interval-id <integer>] - Referenced Interval ID

This parameter indicates the interval in which the cache size effect information is derived from.

[-referenced-interval-time <Date>] - Referenced Interval Time

This parameter indicates the time when the referenced interval for the cache size effect information is derived from.

[-referenced-interval-cache-size {<integer>[KB|MB|GB|TB|PB]] - Referenced Interval Cache Size

This parameter indicates the cache size at the end of the referenced interval from which the cache size effect information is based on.

[-read-hit-20 <percent>] - 20% Cache Read Hit

This parameter indicates the predicted read hit rate when the cache size is 20% of the referenced cache size.

[-read-hit-40 <percent>] - 40% Cache Read Hit

This parameter indicates the predicted read hit rate when the cache size is 40% of the referenced cache size.

[-read-hit-60 <percent>] - 60% Cache Read Hit

This parameter indicates the predicted read hit rate when the cache size is 60% of the referenced cache size.

[-read-hit-80 <percent>] - 80% Cache Read Hit

This parameter indicates the predicted read hit rate when the cache size is 80% of the referenced cache size.

[-read-hit-100 <percent>] - 100% Cache Read Hit

This parameter indicates the predicted read hit rate when the cache size is 100% of the referenced cache size.

[-write-hit-20 <percent>] - 20% Cache Write Hit

This parameter indicates the predicted write hit rate when the cache size is 20% of the referenced cache size.

[-write-hit-40 <percent>] - 40% Cache Write Hit

This parameter indicates the predicted writehit rate when the cache size is 40% of the referenced cache size.

[-write-hit-60 <percent>] - 60% Cache Write Hit

This parameter indicates the predicted write hit rate when the cache size is 60% of the referenced cache size.

[-write-hit-80 <percent>] - 80% Cache Write Hit

This parameter indicates the predicted write hit rate when the cache size is 80% of the referenced cache size.

[-write-hit-100 <percent>] - 100% Cache Write Hit

This parameter indicates the predicted write hit rate when the cache size is 100% of the referenced cache size.

Examples

The following example shows a running instance of automated-working-set-analyzer on node *node1* for aggregate *aggr0*.

```
cluster1::> cluster-1::*> storage automated-working-set-analyzer show
```

Node	FC	Aggregate	wss	Intervals	Start Time
node1	false	aggr0	false	125	Wed Jul 22 13:58:17 2015

storage automated-working-set-analyzer start

Command to start Automated Working Set Analyzer on node or aggregate

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The automated-working-set-analyzer start command enables the Automated Workload Analyzer that is capable of doing the following:

- Flash Pool modeling for an aggregate
- Flash Cache modeling for a node - can not specify an aggregate.
- Working set size estimation
- Workload monitoring

Parameters

-node <nodename> - Node Name

This parameter indicates the node name that the AWA instance runs on.

[-flash-cache {true|false}] - Flash Cache Node-wide Modeling

This parameter indicates whether the AWA is modeling flash-cache.

[-aggregate <aggregate name>] - Aggregate

This parameter indicates the aggregate name that the AWA instance runs on.

[-working-set-size {true|false}] - Working Set Size

This parameter indicates whether the AWA instance is configured to find the working set size.

Examples

```
cluster1::> storage automated-working-set-analyzer start -node vsim1 -aggregate aggr0
```

storage automated-working-set-analyzer stop

Command to stop Automated Working Set Analyzer on node or aggregate

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The storage automated-working-set-analyzer stop command terminates one or multiple Automated Workload Analyzer running instances.

Parameters

-node <nodename> - Node Name

This parameter indicates the node name that the AWA instance runs on.

[-flash-cache {true|false}] - Flash cache node-wide modeling

This parameter indicates whether the AWA is modeling flash-cache.

[-aggregate <aggregate name>] - Aggregate

This parameter indicates the aggregate name that the AWA instance runs on.

Examples

```
cluster1::> storage automated-working-set-analyzer stop -node vsim1 -aggregate aggr1
```

storage automated-working-set-analyzer volume commands

The volume directory

storage automated-working-set-analyzer volume show

Displays the Automated Working Set Analyzer volume table

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The automated-working-set-analyzer volume show command displays the volume statistics reported by the corresponding Automated Working-set Analyzer running instances.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-node <nodename>`] - Node

This parameter indicates the node name that the AWA instance runs on.

[`-flash-cache {true|false}`] - Flash Cache Node-wide Modeling

This parameter indicates whether the AWA is modeling flash-cache.

[`-vol-uuid <UUID>`] - Uuid of the Volume

This parameter indicates the volume uuid that this command is issued on.

[`-aggregate <aggregate name>`] - Aggregate

This parameter indicates the aggregate name that the AWA instance runs on.

[`-volume <volume name>`] - Volume

This parameter indicates the volume name that this command is issued on.

[`-rank <integer>`] - Cache Benefit Rank

This parameter indicates the rank of this volume among all volumes that would be most benefited by the modeled cache technology based on the AWA prediction.

[`-read-throughput {<integer>[Bps|KBps|MBps|GBps]}`] - Read Throughput

This parameter indicates the maximum read throughput over an interval that AWA has observed from the storage disks for this volume.

[`-write-throughput {<integer>[Bps|KBps|MBps|GBps]}`] - Write Throughput

This parameter indicates the maximum write throughput over an interval that AWA has observed to the storage disks for this volume.

[`-cacheable-read <percent>`] - Cacheable Read

This parameter indicates the maximum percent of cacheable read over an interval that AWA has observed for this volume. Cacheable reads are non-sequential reads, i.e., the percentage of data reads that could have been cached.

[`-cacheable-write <percent>`] - Cacheable Write

This parameter indicates the maximum percent of cacheable write over an interval that AWA has observed. Cacheable writes are random overwrites, percentage of disk writes that could have been cached.

[`-projected-cache-size {<integer>[KB|MB|GB|TB|PB]}`] - Max Projected Cache Size

This parameter indicates the projected Flash Pool cache usage by this volume.

[`-projected-read-hit <percent>`] - Projected Read Hit

This parameter indicates the percentage of blocks that could be read from the Flash Pool cache instead of HDDs for this volume.

[`-projected-write-hit <percent>`] - Projected Write Hit

This parameter indicates the percentage of block overwrites that could go to the Flash Pool cache instead of HDDs for this volume.

Examples

```
cluster1::> cluster-1:*> storage automated-working-set-analyzer volume show
Node      FC      Aggregate  Volume      Rank  Read Thrupt  Write Thrupt
-----
vsim1     false  aggr0      vol0         1    230.47KBps   580.09KBps
```

storage bridge commands

Storage bridge monitoring commands

storage bridge add

Add a bridge for monitoring

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage bridge add` command enables you to add FC-to-SAS bridges for SNMP monitoring in a MetroCluster configuration.

Parameters

-address <IP Address> - Bridge Management Port IP Address

This parameter specifies the IP address of the bridge that is being added for monitoring.

[-snmp-community <text>] - SNMP Community

This parameter specifies the SNMP community set on the bridge that is being added for monitoring.

[-veto-backend-fabric-check {true|false}] - Veto Backend Fabric Check (privilege: advanced)

If specified, the `storage bridge add` command will not check if the bridge is present in the MetroCluster's backend fabric. By default, it does not let you add bridges that are not present.

Examples

The following command adds a bridge with IP address '10.226.197.16' for monitoring:

```
cluster1::> storage bridge add -address 10.226.197.16

cluster1::> storage bridge show
```

Bridge	Symbolic Name	Vendor	Model	Bridge WWN	Is Monitored	Monitor Status
ATTO_10.226.197.16	Bridge Number 16	Atto	FibreBridge 6500N	2000001086603824	true	-
ATTO_FibreBridge6500N_2	Not Set	Atto	FibreBridge 6500N	20000010866037e8	false	-
ATTO_FibreBridge6500N_3	Not Set	Atto	FibreBridge 6500N	2000001086609e0e	false	-
ATTO_FibreBridge6500N_4	Not Set	Atto	FibreBridge 6500N	2000001086609c06	false	-

4 entries were displayed.

```
cluster1::>
```

storage bridge modify

Modify a bridge's configuration information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage bridge modify` enables you to modify certain parameters for identifying and accessing the FC-to-SAS bridges added for monitoring in a MetroCluster configuration.

Parameters

-name <text> - Bridge Name

This parameter specifies the name of the bridge.

[-address <IP Address>] - Bridge IP Address

This parameter specifies the IP address of the bridge.

[-snmp-community <text>] - SNMP Community Set on the Bridge

This parameter specifies the SNMP community set on the bridge.

Examples

The following command modifies 'ATTO_10.226.197.16' bridge SNMP community to 'public':

```
cluster1::> storage bridge modify -name ATTO_10.226.197.16 -address 10.226.197.16 -snmp-community public
cluster1::>
```

storage bridge refresh

Refresh storage bridge info

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage bridge refresh` command triggers a refresh of the SNMP data for the MetroCluster FC switches and FC-to-SAS bridges. It does not do anything if the refresh is already going on. The FC switches and FC-to-SAS bridges must have been previously added for monitoring by using the [“storage switch add” on page 1010](#) and [“storage bridge add” on page 845](#) commands respectively.

Examples

The following command triggers a refresh for the SNMP data:

```
cluster1::*> storage bridge refresh
cluster1::*>
```

storage bridge remove

Remove a bridge from monitoring

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage bridge remove` enables you to remove FC-to-SAS bridges that were previously added for SNMP monitoring.

Parameters

-name <text> - Bridge Name

This parameter specifies the name of the bridge added for monitoring.

Examples

The following command removes 'ATTO_10.226.197.16' bridge from monitoring:

```
cluster1::> storage bridge remove -name ATTO_10.226.197.16

cluster1::> storage bridge show
```

Bridge	Symbolic Name	Vendor	Model	Bridge WWN	Is Monitored	Monitor Status

```

-----
ATTO_FibreBridge6500N_1

           2000001086609c06 false -
4 entries were displayed.

```

storage bridge show

Display bridge information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage bridge show` command displays information about all the storage bridges in the MetroCluster configuration. The bridges must have been previously added for monitoring using the [“storage bridge add” on page 845](#) command. If no parameters are specified, the default command displays the following information about the storage bridges:

- Bridge
- Symbolic Name
- Vendor
- Model
- Bridge WWN
- Is Monitored
- Monitor Status

To display detailed profile information about a single storage bridge, use the `-name` parameter.

Parameters

{ **[-fields <fieldname>, ...]**

Displays the specified fields for all the storage bridges, in column style output.

| **[-connectivity]**

Displays the following details about the connectivity from different entities to the storage bridge:

- Node
- Initiator
- Initiator Side Switch Port
- Target Side Switch Port
- Target Port WWN
- Target Port Number

| **[-cooling]**

Displays the following details about the chassis temperature sensor(s) on the storage bridge:

- Sensor Name
- Reading in degree Celsius (C)

- Fan operational status
- Minimum Safe Operating Temperature in degree Celsius (C)
- Maximum Safe Operating Temperature in degree Celsius (C)
- Sensor Status

| **[-error]**

Displays the errors related to the storage bridge.

| **[-ports]**

Displays the following details about the storage bridge FC ports:

- Port number
- Port administrative status
- Port operational status
- Port operating mode
- Port negotiated speed
- Peer world wide name

Displays the following details about the storage bridge SAS ports:

- Port number
- Port negotiated data rate
- Port data rate capability
- Port PHY1 operational status
- Port PHY2 operational status
- Port PHY3 operational status
- Port PHY4 operational status
- Port administrative status
- Port operational status
- Peer world wide name

| **[-power]**

Displays the status of the replaceable power supplies for the FibreBridge 7500 only:

- Power supply name
- Power supply status

| **[-sfp]**

Displays the following details about the storage bridge FC ports Small Form-factor Pluggable (SFP):

- Port number
- SFP vendor
- SFP serial number
- SFP part number
- SFP speed capability

Displays the following details about the storage bridge SAS ports Quad Small Form-factor Pluggable (QSFP):

- Port number
- QSFP vendor
- QSFP serial number

- QSFP type
- QSFP part number

Displays the following details about the storage bridge SAS ports Mini-SAS HD:

- Port number
- Mini-SAS HD vendor
- Mini-SAS HD serial number
- Mini-SAS HD type
- Mini-SAS HD part number

[-stats]

Displays the following details about the storage bridge FC ports:

- Port number
- Port operational status
- Port operational mode
- Port negotiated speed
- Port link failure count
- Port synchronization loss count
- Port CRC error count
- Port operational mode
- Port received word count (Rx)
- Port transmitted word count (Tx)

Displays the following details about the storage bridge SAS ports:

- Port number
- PHY port number
- Port negotiated speed
- Port speed capability
- Port invalid DWORD count
- Port disparity error count
- Port synchronization loss count
- Port PHY reset count
- Port link changed count
- Port CRC error count

[-instance]

Displays expanded information about all the storage bridges in the system. If a storage bridge is specified, then this parameter displays the same detailed information for the storage bridge you specify as does the -name parameter.

[-name <text>] - Bridge Name

Displays information only about the storage bridges that match the name you specify.

[-wwn <text>] - Bridge World Wide Name

Displays information only about the storage bridges that match the bridge wwn you specify.

[-model <text>] - Bridge Model

Displays information only about the storage bridges that match the bridge model you specify.

[-vendor {unknown|Atto}] - Bridge Vendor

Displays information only about the storage bridges that match the bridge vendor you specify.

[-fw-version <text>] - Bridge Firmware Version

Displays information only about the storage bridges that match the bridge firmware version you specify.

[-serial-number <text>] - Bridge Serial Number

Displays information only about the storage bridges that match the bridge serial number you specify.

[-address <IP Address>] - Bridge IP Address

Displays information only about the storage bridges that match the bridge IP address you specify.

[-is-monitoring-enabled {true|false}] - Is Monitoring Enabled for Bridge?

Displays information only about the storage bridges that match the bridge monitoring value you specify.

[-status {unknown|ok|error}] - Bridge Status

Displays information only about the storage bridges that match the bridge monitoring status you specify.

[-profile-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]]] - Bridge Profile Data Last Successful Refresh Timestamp

Displays information only about the storage bridges that match the profile data last successful refresh timestamp you specify.

[-symbolic-name <text>] - Bridge Symbolic Name

Displays information only about the storage bridges that match the symbolic name you specify.

[-snmp-community <text>] - SNMP Community Set on the Bridge

Displays information only about the storage bridges that match the bridge SNMP community you specify.

[-error-text-list <text>, ...] - Bridge Error Description List

Displays information only about the storage bridges that have the errors you specify.

[-temp-sensor-name <text>] - Temperature Sensor Name

Displays information only about the storage bridges that have the temperature sensor with the name you specify.

[-min-safe-oper-temp <integer>] - Minimum Safe Operating Temperature in Degree Celsius

Displays information only about the storage bridges that have the temperature sensor with the minimum safe operating temperature you specify.

[-max-safe-oper-temp <integer>] - Maximum Safe Operating Temperature in Degree Celsius

Displays information only about the storage bridges that have the temperature sensor with the maximum safe operating temperature you specify.

[-temp-reading <integer>] - Chassis Temperature Sensor Reading in Degree Celsius

Displays information only about the storage bridges that have the temperature sensors with the reading you specify.

[-temp-sensor-status {normal|warning|critical}] - Chassis Temperature Sensor Status

Displays information only about the storage bridges that have the temperature sensor with the status you specify.

[-temp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]]] - Bridge Chassis Temperature Data Last Successful Refresh Timestamp

Displays information only about the storage bridges that match the temperature sensor data last successful refresh timestamp you specify.

[-fc-port-index-list <integer>, ...] - Bridge FC Port Index List

Displays information only about the storage bridges that have the ports with the indexes you specify.

[-fc-port-oper-state-list {unknown|online|offline}, ...] - Bridge FC Port Operational State List

Displays information only about the storage bridges that have the ports with the operational states you specify.

[-fc-port-admin-state-list {unknown|disabled|enabled}, ...] - Bridge FC Port Admin State List

Displays information only about the storage bridges that have the ports with the administrative states you specify.

[-fc-port-negotiated-data-rate-list {unknown|2|4|8|16}, ...] - Bridge FC Port Negotiated Data Rate List

Displays information only about the storage bridges that have the ports with the negotiated data rates you specify.

[-fc-port-negotiated-conn-mode-list {unknown|loop|n-port}, ...] - Bridge FC Port Negotiated Connection Mode List

Displays information only about the storage bridges that have the ports with the negotiated connection modes you specify.

[-fc-port-wwn-list <text>, ...] - Bridge FC Port WWN List

Displays information only about the storage bridges that have the ports with the world wide names you specify.

[-fc-port-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]]] - Bridge FC Port Data Last Successful Refresh Timestamp

Displays information only about the storage bridges that match the FC ports data last successful refresh timestamp you specify.

[-fc-port-stats-index-list <integer>, ...] - Bridge FC Port Index List

Displays information only about the storage bridges that have the ports with the indexes you specify.

[-fc-port-tx-words-list <integer>, ...] - Bridge FC Port Transmitted Word Count List

Displays information only about the storage bridges that have the ports with the number of transmitted words you specify.

[-fc-port-rx-words-list <integer>, ...] - Bridge FC Port Received Word Count List

Displays information only about the storage bridges that have the ports with the number of received words you specify.

[-fc-port-link-failures-list <integer>, ...] - Bridge FC Port Link Failure Count List

Displays information only about the storage bridges that have the ports with the number of link failures you specify.

[-fc-port-sync-losses-list <integer>, ...] - Bridge FC Port Sync Loss Count List

Displays information only about the storage bridges that have the ports with the number of synchronization losses you specify.

[-fc-port-invalid-crc-list <integer>, ...] - Bridge FC Port Invalid CRC Count List

Displays information only about the storage bridges that have the ports with the number of invalid CRCs you specify.

[-fc-port-stats-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]]] - Bridge FC Port Stats Last Successful Refresh Timestamp

Displays information only about the storage bridges that match the fc port stats data last successful refresh timestamp you specify.

[-sas-port-index-list <integer>, ...] - Bridge SAS Port Index List

Displays information only about the storage bridges that have the SAS ports with the indexes you specify.

[-sas-port-oper-state-list {unknown|online|offline|degraded}, ...] - Bridge SAS Port Operational State List

Displays information only about the storage bridges that have the SAS ports with the operational states you specify.

[-sas-port-phy1-oper-state-list {unknown|online|offline}, ...] - Bridge SAS Port PHY1 Operational State List

Displays information only about the storage bridges that have the SAS ports with the PHY1 operational states you specify.

[-sas-port-phy2-oper-state-list {unknown|online|offline}, ...] - Bridge SAS Port PHY2 Operational State List

Displays information only about the storage bridges that have the SAS ports with the PHY2 operational states you specify.

[-sas-port-phy3-oper-state-list {unknown|online|offline}, ...] - Bridge SAS Port PHY3 Operational State List

Displays information only about the storage bridges that have the SAS ports with the PHY3 operational states you specify.

[-sas-port-phy4-oper-state-list {unknown|online|offline}, ...] - Bridge SAS Port PHY4 Operational State List

Displays information only about the storage bridges that have the SAS ports with the PHY4 operational states you specify.

[-sas-port-admin-state-list {unknown|disabled|enabled}, ...] - Bridge SAS Port Administrative State List

Displays information only about the storage bridges that have the SAS ports with the administrative states you specify.

[-sas-port-data-rate-capability-list {unknown|1.5Gbps|3Gbps|6Gbps|12Gbps}, ...] - Bridge SAS Port Data Rate Capability List

Displays information only about the storage bridges that have the SAS ports with the data rate capabilities you specify.

[-sas-port-negotiated-data-rate-list {unknown|1.5Gbps|3Gbps|6Gbps|12Gbps}, ...] - Bridge SAS Port Negotiated Data Rate List

Displays information only about the storage bridges that have the SAS ports with the negotiated data rates you specify.

[-sas-port-wwn-list <text>, ...] - Bridge SAS Port WWN List

Displays information only about the storage bridges that have the SAS ports with the world wide names you specify.

[-sas-port-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [(+|-)hh:mm]}] - Bridge SAS Port DB Data Last Successful Refresh Timestamp

Displays information only about the storage bridges that match the SAS ports data last successful refresh timestamp you specify.

[-sas-port-stats-phy-index-list <integer>, ...] - Bridge SAS Port PHY Index List

Displays information only about the storage bridges that have the SAS ports with the PHY indexes you specify.

[-sas-port-link-changed-list <integer>, ...] - Bridge SAS Port Link Changed Count List

Displays information only about the storage bridges that have the SAS ports with the link changed count you specify.

[-sas-port-invalid-crc-list <integer>, ...] - Bridge SAS Port Invalid CRC Count List

Displays information only about the storage bridges that have the SAS ports with the invalid CRCs you specify.

[-sas-port-phy-reset-list <integer>, ...] - Bridge SAS Port PHY Reset Count List

Displays information only about the storage bridges that have the SAS ports with the PHY reset count you specify.

[-sas-port-sync-losses-list <integer>, ...] - Bridge SAS Port Sync Loss Count List

Displays information only about the storage bridges that have the SAS ports with the synchronization losses you specify.

[-sas-port-disparity-count-list <integer>, ...] - Bridge SAS Port Disparity Count List

Displays information only about the storage bridges that have the SAS ports with the disparity count you specify.

[-sas-port-invalid-dword-list <integer>, ...] - Bridge SAS Port Invalid DWORD Count List

Displays information only about the storage bridges that have the SAS ports with the invalid DWORD count you specify.

[-sas-port-stats-index-list <integer>, ...] - Bridge SAS Port Index List

Displays information only about the storage bridges that have the SAS ports with the indexes you specify.

[-sas-port-stats-data-rate-capability-list {unknown|1.5Gbps|3Gbps|6Gbps|12Gbps}, ...] - Bridge SAS Port Data Rate Capability List

Displays information only about the storage bridges that have the SAS ports with the data rate capabilities you specify.

[-sas-port-stats-negotiated-data-rate-list {unknown|1.5Gbps|3Gbps|6Gbps|12Gbps}, ...] - Bridge SAS Port Negotiated Data Rate List

Displays information only about the storage bridges that have the SAS ports with the negotiated data rates you specify.

[-sas-port-stats-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]]] - Bridge SAS Port Statistics Data Last Successful Refresh Timestamp

Displays information only about the storage bridges that match the SAS port stats data last successful refresh timestamp you specify.

[-fc-sfp-port-index-list <integer>, ...] - Bridge FC Port Index List

Displays information only about the storage bridges that have the FC ports with the indexes you specify.

[-fc-port-sfp-vendor-list <text>, ...] - Bridge FC Port SFP Vendor List

Displays information only about the storage bridges that have the FC ports with the SFP vendors you specify.

[-fc-port-sfp-serial-number-list <text>, ...] - Bridge FC Port SFP Serial Number List

Displays information only about the storage bridges that have the FC ports with the SFP serial numbers you specify.

[-fc-port-sfp-part-number-list <text>, ...] - Bridge FC Port SFP Part Number List

Displays information only about the storage bridges that have the FC ports with the SFP part numbers you specify.

[-fc-port-sfp-data-rate-capability-list {2Gb|4Gb|8Gb|16Gb}, ...] - Bridge FC Port SFP Data Rate Capability List

Displays information only about the storage bridges that have the FC ports with the SFP data rate capabilities you specify.

[-fc-port-sfp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]]] - Bridge FC Port SFP Data Last Successful Refresh Timestamp

Displays information only about the storage bridges that match the FC ports SFP data last successful refresh timestamp you specify.

[-sas-qsfp-port-index-list <integer>, ...] - Bridge SAS Port Index List

Displays information only about the storage bridges that have the SAS ports with the indexes you specify.

[-sas-port-qsfp-vendor-list <text>, ...] - Bridge SAS Port QSFP Vendor List

Displays information only about the storage bridges that have the SAS ports with the QSFP vendors you specify.

[-sas-port-qsfp-serial-number-list <text>, ...] - Bridge SAS Port QSFP Serial Number List

Displays information only about the storage bridges that have the SAS ports with the QSFP serial numbers you specify.

[-sas-port-qsfp-type-list {unknown|optical|active-copper|passive-copper}, ...] - Bridge SAS Port QSFP Type List

Displays information only about the storage bridges that have the SAS ports with the QSFP types you specify.

[-sas-port-qsfp-part-number-list <text>, ...] - Bridge SAS Port QSFP Part Number List

Displays information only about the storage bridges that have the SAS ports with the QSFP part numbers you specify.

[-sas-port-qsfp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]]] - Bridge SAS Port QSFP Data Last Successful Refresh Timestamp

Displays information only about the storage bridges that match the SAS ports QSFP data last successful refresh timestamp you specify.

[-mini-sas-hd-index-list <integer>, ...] - Bridge Mini-SAS HD Index List

Displays information only about the storage bridges that have SAS ports with the Mini-SAS HD indexes that you specify.

[-mini-sas-hd-vendor-list <text>, ...] - Bridge Mini-SAS HD Vendor List

Displays information only about the storage bridges that have SAS ports with the Mini-SAS HD vendors that you specify.

[-mini-sas-hd-serial-number-list <text>, ...] - Bridge Mini-SAS HD Serial Number List

Displays information only about the storage bridges that have SAS ports with the Mini-SAS HD serial numbers that you specify.

[-mini-sas-hd-type-list <text>, ...] - Bridge Mini-SAS HD Type List

Displays information only about the storage bridges that have SAS ports with the Mini-SAS HD types that you specify.

[-mini-sas-hd-part-number-list <text>, ...] - Bridge Mini-SAS HD Part Number List

Displays information only about the storage bridges that have SAS ports with the Mini-SAS HD part numbers that you specify.

[-mini-sas-hd-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]]] - Bridge Mini-SAS HD Data Last Successful Refresh Timestamp

Displays information only about the storage bridges that match the SAS ports Mini-SAS HD data with the last successful refresh timestamp that you specify.

[-power-supply-index-list <integer>, ...] - Bridge Power Supply Index List

Displays information only about the storage bridges that have power supplies with the indexes that you specify.

[-power-supply-name-list <text>, ...] - Bridge Power Supply Name List

Displays information only about the storage bridges that have power supplies with the name that you specify.

[-power-supply-status-list {unknown|down|up}, ...] - Bridge Power Supply Status List

Displays information only about the storage bridges that have power supplies with the status that you specify.

[-power-supply-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]]] - Bridge Power Supply Data Last Successful Refresh Timestamp

Displays information only about the storage bridges that match the power supply last data with the last successful refresh timestamp that you specify.

[-node-list {<nodename>|local}, ...] - Node Name List

Displays information only about the storage bridges that are connected to the nodes you specify.

[-initiator-list <text>, ...] - Initiator List

Displays information only about the storage bridges that are connected to the nodes hosting the initiators you specify.

[-initiator-side-switch-port-name-list <text>, ...] - Initiator Side Switch Port Name List

Displays information only about the storage bridges that are connected to the initiator side switch ports you specify.

[-target-side-switch-port-name-list <text>, ...] - Target Side Switch Port Name List

Displays information only about the storage bridges that are connected to the target side switch ports you specify.

[-target-port-wwn-list <text>, ...] - Target Port WWN List

Displays information only about the storage bridges that match the target ports with world wide names you specify.

[-target-port-index-list <integer>, ...] - Target Port Index List

Displays information only about the storage bridges that match the target ports with indexes you specify.

Examples

The following example displays information about all storage bridges:

```
cluster1::> storage bridge show
```

Bridge	Symbolic Name	Vendor	Model	Bridge WWN	Is Monitored	Monitor Status

storage bridge config-dump commands

Manage bridge dumpconfiguration files

storage bridge config-dump collect

Retrieve and save bridge dumpconfiguration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage bridge config-dump collect` command retrieves a dumpconfiguration file from a storage bridge.

Parameters

-bridge <text> - Bridge Name

Use this parameter to retrieve a dumpconfiguration file from the specified storage bridge.

Examples

The following example retrieves a dumpconfiguration file from storage bridge ATTO_FibreBridge7500N_1:

```
cluster1::*> storage bridge config-dump collect -bridge ATTO_FibreBridge7500N_1
[Job 883] Job is queued: Collect the dumpconfiguration file from bridge "ATTO_FibreBridge7500N_1".

cluster1::*>
```

storage bridge config-dump delete

Delete a dumpconfiguration file

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage bridge config-dump delete` command deletes dumpconfiguration files previously retrieved with the [“storage bridge config-dump collect” on page 859](#) command.

Parameters

-node {<nodename>|local} - **Node**

Use this parameter to delete a dumpconfiguration file stored on the specified node.

-file <text> - **Config File**

Use this parameter to delete the dumpconfiguration file with the specified file name.

Examples

The following example deletes dsbridge_config.FB7500N100001.2017-04-28_14_49_30.txt from node1:

```
cluster1::*> storage bridge config-dump delete -node node1 -file dsbridge_config.FB7500N100001.2017-04-28_14_49_30.txt

cluster1::*>
```

storage bridge config-dump show

Display a list of bridge dumpconfiguration files

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage bridge config-dump show` command displays information about all the dumpconfiguration files previously retrieved with the [“storage bridge config-dump collect” on page 859](#) command. If no parameters are specified, the default command displays the following information about the dumpconfiguration files:

- Node
- File Name
- Timestamp
- Bridge
- Bridge Serial Number

To display detailed information about a single dumpconfiguration file, use the `-node` and `-file` parameters.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|/local/}] - Node

Displays information about the dumpconfiguration files stored on the node that matches the specified node name.

[-file <text>] - Config File

Displays information about the dumpconfiguration files that match the specified file name.

[-bridge <text>] - Bridge Name

Displays information about the dumpconfiguration files from the storage bridge that matches the specified bridge name.

[-serial-number <text>] - Serial Number of Bridge

Displays information about the dumpconfiguration files from the storage bridge that matches the specified serial number.

[-timestamp <MM/DD/YYYY HH:MM:SS>] - Time of Collection

Displays information about the dumpconfiguration files that were collected at the specified time.

Examples

The following example displays information about all dumpconfiguration files:

```
cluster1::*> storage bridge config-dump show

Bridge: ATTO_FibreBridge7500N_1

Node  File Name                                     Timestamp
-----
node1  dsbridge_config.FB7500N100001.2017-05-01_09_53_53.txt  5/1/2017 09:53:53
node2  dsbridge_config.FB7500N100001.2017-04-28_14_48_35.txt  4/28/2017 14:48:35
       dsbridge_config.FB7500N100001.2017-04-28_15_50_20.txt  4/28/2017 15:50:20
3 entries were displayed.

cluster1::*>
```

The following example displays detailed information about all dumpconfiguration files:

```
cluster1::*> storage bridge config-dump show -instance

Node: node1
Bridge Name: ATTO_FibreBridge7500N_1
Filename: dsbridge_config.FB7500N100001.2017-05-01_09_53_53.txt
Timestamp: 5/1/2017 09:53:53
Bridge Serial Number: FB7500N100001

Node: node2
Bridge Name: ATTO_FibreBridge7500N_1
Filename: dsbridge_config.FB7500N100001.2017-04-28_14_48_35.txt
Timestamp: 4/28/2017 14:48:35
Bridge Serial Number: FB7500N100001

Node: node2
Bridge Name: ATTO_FibreBridge7500N_1
Filename: dsbridge_config.FB7500N100001.2017-04-28_15_50_20.txt
```

```
Timestamp: 4/28/2017 15:50:20
Bridge Serial Number: FB7500N100001
3 entries were displayed.

cluster1::*>
```

storage bridge coredump commands

The coredump directory

storage bridge coredump collect

Retrieve and save coredump

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage bridge coredump collect` command retrieves a core file from a storage bridge.

Parameters

-name <text> - Bridge Name

This parameter specifies the storage bridge name from which the coredump file is to be collected.

Examples

The following example retrieves a coredump from storage bridge ATTO_FibreBridge7500N_1:

```
cluster1::> storage bridge coredump collect -bridge ATTO_FibreBridge7500N_1
[Job 883] Job is queued: Collect the coredump from bridge "ATTO_FibreBridge7500N_1".

cluster1::>
```

storage bridge coredump delete

Delete a saved coredump file.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage bridge coredump delete` command deletes a coredump file previously retrieved with the [“storage bridge coredump collect” on page 862](#) command.

Parameters

-name <text> - Bridge Name

This parameter specifies the name of the bridge that the coredump file belongs to.

-corename <text> - Coredump Filename

This parameter specifies the name of the coredump file to be deleted.

Examples

The following example deletes coredump file `core.FB7500N100018.1970-01-05.17_50_30.mem` collected from bridge ATTO_FibreBridge7500N_1:

```
cluster1::> storage bridge coredump delete -name ATTO_FibreBridge7500N_1 -corename core.FB7500N100018.1970-01-05.17_50_30.mem

cluster1::>
```

storage bridge coredump show

Display a list of bridge coredumps

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage bridge coredump show` command displays information about all the coredump files previously retrieved with the [“storage bridge coredump collect” on page 862](#) command. If no parameters are specified, the default command displays the following information about the coredump files:

- Bridge Name
- Bridge Serial Number
- Coredump Filename
- Located on Node
- Panic Timestamp
- Panic String

To display detailed information about a single coredump file, use the `-node` and `-corename` parameters.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-serial-number <text>] - Bridge Serial Number

Use this parameter to select the coredump files from the storage bridge that matches the specified bridge serial number.

[-corename <text>] - Coredump Filename

Use this parameter to select the coredump files that matches the specified file name.

[-name <text>] - Bridge Name

Use this parameter to select the coredump files from the storage bridge that matches the specified bridge name.

[-node <nodename>] - Located on Node

Use this parameter to select the coredump files that are located on the specified node.

[-panic-time <MM/DD/YYYY HH:MM:SS>] - Panic Timestamp

Use this parameter to select the coredump files that were collected at the specified time.

[-panic-string <text>] - Panic String

Use this parameter to select the coredump files that matches the specified panic string.

Examples

The following example displays information about all coredump files:

```
cluster1::> storage bridge coredump show

      Bridge Name: ATTO_FibreBridge7500N_1
Bridge Serial Number: FB7500N100018
      Coredump Filename: core.FB7500N100018.1970-01-05.17_50_30.mem
```

```
Located on Node: stg-8020-6a
Panic Timestamp: 7/6/2017 11:03:37
Panic String: CoreDumpGenerate CLI Command
```

```
cluster1::>
```

storage bridge firmware commands

The firmware directory

storage bridge firmware update

Download firmware onto the bridge so it can be updated

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage bridge firmware update` command downloads the firmware onto the bridge. The bridge needs to be rebooted for the firmware update to occur. The firmware file to be used is specified by the `-uri` parameter.

Parameters

-bridge <text> - bridge name

This specifies the bridge whose firmware needs to be updated.

-uri <text> - URI

This parameter specifies the URI from which the firmware file is downloaded onto the bridge.

Examples

The following example updates the firmware on bridge ATTO_FibreBridge7500N_1.

```
cluster1::* > storage bridge firmware update -name ATTO_FibreBridge7500N_1 -uri http://10.60.132.97/firmware.zbd
```

storage disk commands

Manage physical disks

storage disk assign

Assign ownership of a disk to a system

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage disk assign` command is used to assign ownership of an unowned disk or array LUN to a specific node. You can also use this command to change the ownership of a disk or an array LUN to another node. You can designate disk ownership by specifying disk names, array LUN names, wildcards, or all (for all disks or array LUNs visible to the node). For disks, you can also set up disk ownership autoassignment. You can also assign disks to a particular pool. You can also assign disks by copying ownership from another disk.

Parameters

{ [-disk <disk path name>] - Disk Path

This specifies the disk or array LUN that is to be assigned. Disk names take one of the following forms:

- Disks are named in the form `<stack-id>.<shelf>.<bay>`
- Disks on multi-disk carriers are named in the form `<stack-id>.<shelf>.<bay>.<lun>`
- Virtual disks are named in the form `<prefix>.<number>`, where prefix is the storage array's prefix and number is a unique ascending number.

Disk names take one of the following forms on clusters that are not yet fully upgraded to Data ONTAP 8.3:

- Disks that are not attached to a switch are named in the form `<node>:<host_adapter>.<loop_ID>`. For disks with a LUN, the form is `<node>:<host_adapter>.<loop_ID>L<LUN>`. For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16Llun0.
- Disks that are attached to a switch are named in the form `<node>:<switch_name>:<switch_port>.<loop_ID>`. For disks with a LUN, the form is `<node>:<switch_name>:<switch_port>.<loop_ID>L<LUN>`. For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08Llun1.

Before the cluster is upgraded to Data ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique identifier (UUID) or serial number.

A subset of disks or array LUNs can be assigned using the wildcard character (*) in the `-disk` parameter. Either the `-owner`, the `-sysid`, or the `-copy-ownership-from` parameter must be specified with the `-disk` parameter. Do not use the `-node` parameter with the `-disk` parameter.

| **-disklist** *<disk path name>*, ... - **Disk list**

This specifies the List of disks to be assigned.

| **-all** [*true*] - **Assign All Disks**

This optional parameter causes assignment of all visible unowned disks or array LUNs to the node specified in the `-node` parameter. The `-node` parameter must be specified with the `-all` parameter. When the `-copy-ownership-from` parameter is specified with the `-node` parameter, it assigns disk ownership based on the `-copy-ownership-from` parameter; otherwise it assigns ownership of the disks based on the `-node` parameter. Do not use the `-owner` or the `-sysid` parameter with the `-all` parameter.

| **[-type | -T {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM}]** - **Storage Type**

This optional parameter assigns ownership of a specific type of disk or array LUN (or a set of disks/array LUNs) to a node. The `-count` parameter must be specified with the `-type` parameter.

-count | -n *<integer>* - **Disk Count**

This optional parameter assigns ownership of a number of disks or array LUNs specified in the `-count` parameter, to a node.

| **-auto** [*true*] - **Auto Assign**

This optional parameter causes all visible disks eligible for autoassignment to be immediately assigned to the node specified in the `-node` parameter, regardless of the setting of the `disk.auto_assign` option. Only unowned disks on loops or stacks owned wholly by that system and which have the same pool information will be assigned. The `-node` parameter must be specified with the `-auto` parameter. Do not use the `-owner`, the `-sysid`, or the `-copy-ownership-from` parameter with the `-auto` parameter. When possible, use the `-auto` parameter rather than the `-all` parameter to conform to disk ownership best practices. The `-auto` parameter is ignored for array LUNs.

[-pool | -p *<integer>***] - Pool**

This optional parameter specifies the pool to which a disk must be assigned. It can take values of Pool0 or Pool1.

{ [-owner | -o <nodename>] - Owner Name

This optional parameter specifies the node to which the disk or array LUN has to be assigned.

[-sysid | -s <nvramid>] - New Owner ID

This optional parameter specifies the serial number (NVRAM ID) of the node to which the disk or array LUN has to be assigned.

| [-copy-ownership-from <disk path name>] - Disk Name to Copy Ownership

This optional parameter specifies the disk name from where the node needs to copy disk ownership information. You can use this parameter for disks to have the same ownership as the provided input disk.

[-checksum | -c {block|zoned|advanced_zoned}] - Checksum Compatibility

This optional parameter is used to set the checksum type for a disk or an array LUN. The possible values are *block*, *zoned*, and *advanced_zoned*. This operation will fail if the specified disk is incompatible with the specified checksum type. A newly created aggregate with zoned checksum array LUNs is assigned advanced zoned checksum (AZCS) checksum type. AZCS checksum type provides more functionality than the "version 1" zoned checksum type which has been supported in previous Data ONTAP releases. Zoned checksum spare array LUNs added to an existing zoned checksum aggregate continue to be zoned checksum. Zoned checksum spare array LUNs added to an AZCS checksum type aggregate use the AZCS checksum scheme for managing checksums. For some disks (e.g. FCAL, SSD, SAS disks), the checksum type cannot be modified. For more information on modifying the checksum type, refer to the "Physical Storage Management Guide".

[-force | -f [true]] - Force Flag

This optional parameter forces the assignment of ownership of an already owned disk to a node. This parameter could also be used to assign an array LUN with a redundancy error, for example, if the array LUN is available on only one path. For a disk which is part of a live aggregate, even specification of the *-force* parameter would not force the assignment, since it would be catastrophic.

[-node | -N <nodename>] - Node Name (For Auto Assign)

This optional parameter is used with either the *-auto* or the *-all* parameter. If used with the *-auto* parameter, all disks which are visible to the node specified in the *-node* parameter and which are eligible for autoassignment would be assigned to it. If used with the *-all* parameter, all unowned disks or array LUNs visible to the node would be assigned to it.

{ [-root [true]] - Root Partition of Root-Data or Root-Data1-Data2 Partitioned Disk (privilege: advanced)

This optional parameter assigns the root partition of a root-data/root-data1-data2 partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is *false*.

| [-data [true]] - Data Partition of Root-Data Partitioned Disk (privilege: advanced)

This optional parameter assigns the data partition of a root-data partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is *false*.

| [-data1 [true]] - Data1 Partition of Root-Data1-Data2 Partitioned Disk (privilege: advanced)

This optional parameter assigns the data1 partition of a root-data1-data2 partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is *false*.

| [-data2 [true]] - Data2 Partition of Root-Data1-Data2 Partitioned Disk (privilege: advanced)

This optional parameter assigns the data2 partition of a root-data1-data2 partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is *false*.

Examples

The following example assigns ownership of an unowned disk named *1.1.16* to a node named *node1*:

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1
```

The following example assigns all unowned disks or array LUNs visible to a node named *node1* to itself:

```
cluster1::> storage disk assign -all -node node1
```

The following example autoassigns all unowned disks (eligible for autoassignment) visible to a node named *node1* to itself:

```
cluster1::> storage disk assign -auto -node node1
```

The following two examples show the working of the `-force` parameter with a spare disk that is already owned by another system:

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1
Error: command failed: Failed to assign disks. Reason: Disk 1.1.16 is
already owned.
```

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1 -force
Success.
```

The following example assigns ownership of the set of unowned disks on `<stack> 1`, to a node named `node1`:

```
cluster1::> storage disk assign -disk 1.* -owner node1
```

The following example assigns ownership of unowned disk `1.1.16` by copying ownership from disk `1.1.18`:

```
cluster1::> storage disk assign -disk 1.1.16
-copy-ownership-from 1.1.18
```

The following example assigns all unowned disks visible to a node named `node1` by copying ownership from disk `1.1.18`:

```
cluster1::> storage disk assign -all -node node1
-copy-ownership-from 1.1.18
```

The following example assigns the root partition of disk `1.1.16` to `node1`.

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1 -root true
```

The following example assigns the data partition of root-data partitioned disk `1.1.16` to `node1`.

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1 -data true
```

The following example assigns the data1 partition of root-data1-data2 partitioned disk `1.1.24` to `node1`.

```
cluster1::> storage disk assign -disk 1.1.24 -owner node1 -data1 true
```

The following example assigns the data2 partition of root-data1-data2 partitioned disk `1.1.24` to `node1.z33`

```
cluster1::> storage disk assign -disk 1.1.24 -owner node1 -data2 true
```

storage disk fail

Fail the file system disk

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage disk fail` command can be used to manually force a file system disk to fail. It is used to remove a file system disk that may be logging excessive errors and requires replacement. To unfail a disk, use the [“storage disk unfail” on page 889](#) command.

Parameters

-disk <disk path name> - Disk Name

This parameter specifies the disk to be failed.

[-immediate | -i [true]] - Fail immediately

This parameter optionally specifies whether the disk is to be failed immediately. It is used to avoid Rapid RAID Recovery and remove the disk from the RAID configuration immediately. Note that when a file system disk has been removed in this manner, the RAID group to which the disk belongs enters degraded mode (meaning a disk is missing from the RAID group). If a suitable spare disk is available, the contents of the disk being removed are reconstructed onto that spare disk.

Examples

The following example fails a disk named `1.1.16` immediately:

```
cluster1:: storage disk fail -disk 1.1.16 -i true
WARNING: The system will not prefail the disk and its contents will not be
copied to a replacement disk before being failed out. Do you want to
```

fail out the disk immediately? [y|n]: y

storage disk reassign

(DEPRECATED)-Change the default owner of all disks from one node to another

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage disk reassign` is deprecated and may be removed in a future release of Data ONTAP. Disk reassignment is no longer required as part of a controller replacement procedure. For further information, see the latest controller or NVRAM FRU replacement flyer for your system. This command changes the ownership of all disks on a node to the ownership of another node. Use this command only when a node has a complete failure (for instance, a motherboard failure) and is replaced by another node. If the node's disks have already been taken over by its storage failover partner, use the `-force` parameter.

Parameters

-homeid | -s <nvrmaid> - Current Home ID

This specifies the serial number of the failed node.

-newhomeid | -d <nvrmaid> - New Home ID

This specifies the serial number of the node that is to take ownership of the failed node's disks.

[-force | -f [true]] - Force

This optionally specifies whether to force the reassignment operation. The default setting is `false`.

Examples

In the following example, a node named `node0` and having serial number 12345678 has failed. Its disks have not been taken over by its storage failover partner. A replacement node with serial number 23456789 was installed and connected to `node0`'s disk shelves. To assign `node0`'s disks to the new node, start the new node and run the following command:

```
cluster:*> storage disk reassign -homeid 12345678 -newhomeid 23456789
node0's disks 1.1.11, 1.1.12, 1.1.13, 1.1.14, 1.1.15, 1.1.16, 1.1.23 and 1.1.24
were reassigned to new owner with serial number 23456789.
```

In the following example, a similar failure has occurred, except that `node0`'s disks have been taken over by its storage failover partner, `node1`. A new node with serial number 23456789 has been installed and configured. To assign the disks that previously belonged to `node0` to this new node, run the following command:

```
cluster:*> storage disk reassign -homeid 12345678 -newhomeid 23456789 -force true
node0's disks 1.1.11, 1.1.12, 1.1.13, 1.1.14, 1.1.15, 1.1.16, 1.1.23 and 1.1.24
were reassigned to new owner with serial number 23456789.
```

storage disk refresh-ownership

Refresh the disk ownership information on a node

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command updates the disk ownership information for all the disks attached to a node to the latest view for all the nodes in the cluster. During normal operations, disk ownership is kept up to date automatically. In certain circumstances, however, disk ownership must be updated manually. If this is required, EMS messages will indicate that this command should be run. If the `-node` parameter is provided, the disk ownership information is updated only on the node specified.

Parameters

[-node {<nodename>|local}] - Node

If this parameter is provided, the disk ownership information is updated only on the node specified.

Examples

The following example refreshes the disk ownership information for all the nodes in the cluster:

```
cluster1::> storage disk refresh-ownership
```

storage disk remove

Remove a spare disk

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage disk remove` command removes the specified spare disk from the RAID configuration, spinning the disk down when removal is complete.

This command does not remove disk ownership information from the disk. Therefore, if you plan to reuse the disk in a different storage system, you should use the [“storage disk removeowner” on page 870](#) command instead. See the "Physical Storage Management Guide" for the complete procedure.

NOTE: For systems with multi-disk carriers, it is important to ensure that none of the disks in the carrier are filesystem disks before attempting removal. To convert a filesystem disk to a spare disk, see [“storage disk replace” on page 870](#).

Parameters

-disk <disk path name> - Disk Name

This parameter specifies the disk to be removed.

Examples

The following example removes a spare disk named 1.1.16:

```
cluster1::> storage disk remove -disk 1.1.16
```

storage disk remove-reservation

Removes reservation from an array LUN marked as foreign.

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage disk remove-reservation` command removes persistent reservation from a specified foreign array LUN.

Parameters

-disk <disk path name> - Disk Name

This specifies the disk from which persistent reservation is to be removed.

Examples

The following example removes the persistent reservation from a disk named node1:switch01:port.126L1.

```
cluster1::> storage disk remove-reservation -disk node1:switch01:port.126L1
```

storage disk removeowner

Remove disk ownership

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage disk removeowner` command removes ownership from a specified disk. Then disk can then be reassigned to a new owner.

Parameters

-disk <disk path name> - Disk Name

This specifies the disk whose ownership is to be removed.

{ [-root [true]] - Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk (privilege: advanced)

This optional parameter removes ownership of the root partition of a root-data/root-data1-data2 partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is *false*.

[-data [true]] - Data Partition of Root-Data Partitioned Disk (privilege: advanced)

This optional parameter removes ownership of the data partition of a root-data partitioned disk. You cannot use this parameter with a root-data1-data2 partitioned disk or disks that are part of a storage pool. The default value is *false*.

[-data1 [true]] - Data1 Partition of a Root-Data1-Data2 Partitioned Disk (privilege: advanced)

This optional parameter removes ownership of the data1 partition of a root-data1-data2 partitioned disk. You cannot use this parameter with a root-data partitioned disk or disks that are part of a storage pool. The default value is *false*.

[-data2 [true]] - Data2 Partition of a Root-Data1-Data2 Partitioned Disk (privilege: advanced)

This optional parameter removes ownership of the data2 partition of a root-data1-data2 partitioned disk. You cannot use this parameter with a root-data partitioned disk or disks that are part of a storage pool. The default value is *false*.

Examples

The following example removes the ownership from a disk named 1.1.27.

```
cluster1::> storage disk removeowner -disk 1.1.27
```

The following example removes ownership of the root partition on disk 1.1.16.

```
cluster1::> storage disk removeowner -disk 1.1.16 -root true
```

The following example removes ownership of the data partition on disk 1.1.16.

```
cluster1::> storage disk removeowner -disk 1.1.16 -data true
```

The following example removes ownership of the data1 partition on disk 1.1.23.

```
cluster1::> storage disk removeowner -disk 1.1.23 -data1 true
```

The following example removes ownership of the data2 partition on disk 1.1.23.

```
cluster1::> storage disk removeowner -disk 1.1.23 -data2 true
```

storage disk replace

Initiate or stop replacing a file-system disk

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage disk replace` command starts or stops the replacement of a file system disk with spare disk. When you start a replacement, Rapid RAID Recovery begins copying data from the specified file system disk to a spare disk. When the process is complete, the spare disk becomes the active file system disk and the file system disk becomes a spare disk. If you stop a replacement, the data copy is halted, and the file system disk and spare disk retain their initial roles.

Parameters

-disk <disk path name> - Disk Name

This specifies the file system disk that is to be replaced. Disk names take one of the following forms:

- Disks are named in the form `<stack-id>.<shelf>.<bay>`
- Disks on multi-disk carriers are named in the form `<stack-id>.<shelf>.<bay>.<lun>`
- Virtual disks are named in the form `<prefix>.<number>`, where prefix is the storage array's prefix and number is a unique ascending number.

Disk names take one of the following forms on clusters that are not yet fully upgraded to Data ONTAP 8.3:

- Disks that are not attached to a switch are named in the form `<node>:<host_adapter>.<loop_ID>`. For disks with a LUN, the form is `<node>:<host_adapter>.<loop_ID>L<LUN>`. For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16Llun0.
- Disks that are attached to a switch are named in the form `<node>:<switch_name>:<switch_port>.<loop_ID>`. For disks with a LUN, the form is `<node>:<switch_name>:<switch_port>.<loop_ID>L<LUN>`. For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08Llun1.

Before the cluster is upgraded to Data ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique identifier (UUID) or serial number.

-action {start | stop} - Action

This specifies whether to start or stop the replacement process.

[-replacement <disk path name>] - Replacement

This specifies the spare disk that is to replace the file system disk.

[-allow-same-carrier [true]] - Allow Same RAID Group Within Carrier

This parameter can be used to allow two disks housed in the same carrier to be in the same RAID group when you replace a disk in an aggregate.

Having disks in the same carrier in the same RAID group is not desirable because a carrier failure can cause a simultaneous outage for two disks in the same RAID group. You can replace a disk in an aggregate with a disk that causes this situation, but when an alternate disk becomes available, Data ONTAP automatically initiates a series of disk copy operations to put the disks into different RAID groups. For this reason, you should use this parameter only when necessary. When possible, ensure that disks housed in the same carrier are in different RAID groups.

This parameter affects only the disk replace operation. It is not a persistent attribute of the aggregate.

[-allow-mixing | -m [true]] - Allow Mixing of Disks of Different RPM or Pool

This optional parameter specifies whether the disk can be replaced with another disk of different RPM or from different Pool. This parameter affects only the current disk replacement operation.

Examples

The following example begins replacing a file system disk named *1.0.16* with a spare disk named *1.1.14*.
`cluster1::> storage disk replace -disk 1.0.16 -replacement 1.1.14 -action start`

storage disk set-foreign-lun

Sets or Unsets an array LUN as foreign

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage disk set-foreign-lun` command sets or unsets a specified array LUN as foreign. This command will enable/disable the feature of importing the data from foreign LUN.

Parameters

-disk <disk path name> - Disk Name

This parameter specifies the array LUN which is to be set or unset as foreign.

-is-foreign-lun [true] - Is Foreign LUN

If the parameter value specified is *true* then array LUN is set as foreign. If the parameter value specified is *false* then array LUN foreignness is cleared.

Examples

The following example shows how to set an array LUN as foreign:

```
cluster1::> storage disk set-foreign-lun -disk EMC-1.1 -is-foreign-lun true
```

The following example shows how to mark an array LUN as not foreign:

```
cluster1::> storage disk set-foreign-lun -disk EMC-1.1 -is-foreign-lun false
```

storage disk set-led

Identify disks by turning on their LEDs

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage disk set-led` command controls the LED of a specified disk.

You can turn an LED on or off, cause it to blink or stop blinking, or test it.

This command is useful for locating a disk in its shelf.

Parameters

-action {on|off|blink|blinkoff|testall|resetall} - Action

This parameter specifies the state to which the LED is to be set. Possible values include the following:

- on - The LED is lit steadily
- off - The LED is not lit
- blink - The LED blinks

- blinkoff - The LED stops blinking and is not lit
- testall - This tests the operation of every disk enclosure's hardware and drivers per node. Do not use this value in normal operation.
- resettall - This resets the LED of every disk on the node and lights up the LED of disks with faults.

{ [-disk <disk path name>] - Disk Name

This specifies the disk whose LED is to be set. Disk names take one of the following forms:

- Disks are named in the form <stack-id>.<shelf>.<bay>
- Disks on multi-disk carriers are named in the form <stack-id>.<shelf>.<bay>.<lun>
- Virtual disks are named in the form <prefix>.<number>, where prefix is the storage array's prefix and number is a unique ascending number.

Disk names take one of the following forms on clusters that are not yet fully upgraded to Data ONTAP 8.3:

- Disks that are not attached to a switch are named in the form <node>:<host_adapter>.<loop_ID>. For disks with a LUN, the form is <node>:<host_adapter>.<loop_ID>L<LUN>. For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16Lun0.
- Disks that are attached to a switch are named in the form <node>:<switch_name>:<switch_port>.<loop_ID>. For disks with a LUN, the form is <node>:<switch_name>:<switch_port>.<loop_ID>L<LUN>. For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08Lun1.

Before the cluster is upgraded to Data ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique identifier (UUID) or serial number.

| [-adapter <text>] - Adapter Name

The name of the adapter to which the shelves of disks of interest are attached to.

[-node {<nodename>|local}] - Node Name

The node for which action is to be taken.

[-duration <integer>] - Duration (minutes)

This specifies the duration, in minutes, that the LED is to remain in the specified state. Only actions "on" and "blink" are supported.

[-iteration <integer>] - Test iterations

This specifies the number of iterations to run the action for. Only action "test-all" is supported.

Examples

The following example causes the LEDs on all disks whose names match the pattern Cluster1* to turn on for 5 minutes:

```
Cluster1::> storage disk set-led -disk Cluster1* -action on -duration 5
```

The following example causes the LEDs on all disks attached to adapter 0b on Node2 to turn on for 1 minute:

```
Cluster1::> storage disk set-led -node Node2 -adapter 0b -action on -duration 1
```

The following example resets the LEDs on all disks on the local node and causes the LEDs of disks with faults to turn on:

```
Cluster1::> storage disk set-led -action resettall
```

The following example causes the LEDs on all disks whose names match the pattern Cluster1* to turn on for 2 minutes:

```
Cluster1::> storage disk set-led -disk Cluster1* -action on -duration 2
```

The following example tests the LEDs on all disks owned by the local node for 3 iterations:

```
Cluster1::> storage disk set-led -action testall -iteration 3
```

storage disk show

Display a list of disk drives and array LUNs

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage disk show` command displays information about disks and array LUNs. Where it appears in the remainder of this document "disk" may refer to either a disk or an array LUN. By default, the command displays the following information about all disks in column style output:

- Disk name
- Usable space on the disk, in human readable units
- Shelf number
- Bay number
- Container type (aggregate, broken, foreign, labelmaint, maintenance, mediator, remote, shared, spare, unassigned, unknown, volume, or unsupported)
- Position (copy, data, dparity, orphan, parity, pending, present, shared or tparity)
- Container name
- Owning node name

To display detailed information about a single disk, use the `-disk` parameter.

Parameters

{ **[-fields** <fieldname>, ...]

Displays the specified fields for all disks, in column style output.

| **[-broken]**

Displays the following RAID-related information about broken disks:

- Original owning node name
- Checksum compatibility
- Disk name
- Outage reason
- Host bus adapter
- Shelf number
- Bay number
- Primary port / Channel
- Pool
- Disk type
- RPM (Revolutions per minute)
- Usable size in human readable units
- Physical size in human readable units
- Current owner node

| **[-errors]**

Displays the following disk information about the disks which have errors.

- Disk Name
- Error Type

- Error Description and corresponding corrective action

| **[-longop]**

Displays the following information about long-running disk operations, in column style output:

- Disk name
- Whether the disk is marked as prefailed
- Whether the disk is being replaced
- Whether the disk is zeroed
- Copy destination
- Percentage of copy complete
- Percentage of zeroing complete
- Percentage of reconstruction complete

| **[-maintenance]**

Displays the following RAID-related information about disks in the maintenance center:

- Original owning node name
- Checksum compatibility
- Disk name
- Outage Reason
- Host bus adapter
- Shelf number
- Bay number
- Primary port / Channel
- Pool
- Disk type
- RPM (Revolutions per minute)
- Usable size in human readable units
- Physical size in human readable units
- Current owner node

| **[-ownership]**

Displays the following ownership-related information:

- Disk name
- Aggregate name
- Home node name
- Owning node name
- Disaster recovery home node name
- Home node system id
- Owning node system id
- Disaster recovery home node system id
- Reservation node system id
- SyncMirror pool

| **[-partition-ownership]**

Displays the following ownership-related information for partitioned disks:

- Disk name
- Aggregate name
- Owner of root partition on a partitioned disk
- Owner system id of root partition on a partitioned disk
- Owner of data or data1 partition on a root-data or a root-data1-data2 partitioned disk respectively
- Owner system id of data or data1 partition on a root-data or a root-data1-data2 partitioned disk respectively
- Owner of data2 partition on a root-data1-data2 partitioned disk
- Owner system id of data2 partition on a root-data1-data2 partitioned disk
- Owner of the disk which is partitioned
- Owner system id of the disk which is partitioned

| [-physical]

Displays the following information about the disk's physical attributes, in column style output:

- Disk name
- Disk type
- Disk vendor
- Disk model
- Firmware revision level
- RPM (Revolutions per minute)
- BPS (Bytes per sector)

| [-port]

Displays the following path-related information:

- Disk name and disk port associated with disk primary path
- Disk name and disk port associated with the disk secondary path, for a multipath configuration
- Type, shelf, and bay information for the disks

| [-raid]

Displays the following RAID-related information:

- Disk name
- Container type (aggregate, broken, labelmaint, maintenance, mediator, remote, shared, spare, unassigned, unknown, or volume)
- Outage reason
- Position (copy, data, dparity, orphan, parity, pending, present, shared or tparity)
- RAID group name
- Aggregate name

| [-raid-info-for-aggregate]

Displays the following RAID-related information about the disks used in an aggregate:

- Owning node name
- Aggregate name
- Plex name
- RAID group name
- Position (copy, data, dparity, orphan, parity, pending, present, shared or tparity)

- Disk name
- Host bus adapter
- Shelf number
- Bay number
- Primary port / Channel
- Pool
- Disk type
- RPM (Revolutions per minute)
- Usable size in human readable units
- Physical size in human readable units

When this parameter is specified, RAID groups that use shared disks are not included. Use [“storage aggregate show-status” on page 798](#) to show information for all RAID groups and aggregates.

| **[-spare]**

Displays the following RAID-related information about available spare disks:

- Original owning node name
- Checksum compatibility
- Disk name
- Host bus adapter
- Shelf number
- Bay number
- Primary port / Channel
- Pool
- Disk type
- Disk class
- RPM (Revolutions per minute)
- Usable size in human readable units
- Physical size in human readable units
- Current owner node

| **[-ssd-wear]**

Displays the following wear life related information about solid state disks:

- **Rated Life Used** : An estimate of the percentage of device life that has been used, based on the actual device usage and the manufacturer's prediction of device life. A value greater than 99 indicates that the estimated endurance has been used, but this does not necessarily indicate a device failure. Omitted if value is unknown.
- **Spare Blocks Consumed Limit** : Spare blocks consumed percentage limit reported by the device. When the Spare Blocks Consumed percentage for the device reaches this read-only value, Data ONTAP initiates a disk copy operation to prepare to remove the device from service. Omitted if value is unknown.
- **Spare Blocks Consumed** : Percentage of device spare blocks that have been used. Each device has a number of spare blocks that will be used when a data block can no longer be used to store data. This value reports what percentage of the spares have already been consumed. Omitted if value is unknown.

| **[-virtual-machine-disk-info]**

Displays information about Data ONTAP virtual disks, their mapped datastores and their specific backing device attributes, such as: disk or LUN, adapter and initiator details (if applicable).

- Disk name.
- Name of the node.
- Data ONTAP-supplied serial number of the system disk.
- Size of the system disk.
- Name of the disk backing store. A backing store represents a storage location for virtual machine files. It can be a VMFS volume, a directory on network-attached storage, or a local file system path.
- File name of the virtual disk used by the hypervisor. Each Data ONTAP disk is mapped to a unique VM disk file.
- Type of the disk backing store. It can be a VMFS volume, a directory on network-attached storage, or a local file system path.
- Size of the disk backing store.
- Full path to the backing store for network-attached storage. This field is valid only for NAS connections.
- Backing adapter PCI device ID for the virtual disk, for example "50:00.0".
- Backing adapter device name, for example "vmhba32".
- Backing adapter model type, for example "LSI1064E".
- Backing adapter driver name of the initiator.
- The iSCSI name of the disk backing target. This field is valid only for iSCSI connections.
- The iSCSI IP address of the disk backing target. This field is valid only for iSCSI connections.
- SCSI device name for the backing disk. It takes the form target-id:lun-id, for example "2:1".
- Hypervisor-assigned unique ID of the backing device (disk or LUN).
- Backing disk partition number where the corresponding VM disk file resides.
- Size of the backing device (disk or LUN).
- Backing device manufacturer, for example "FUJITSU" or "IBM".
- Backing device model, for example "MBE2073RC" or "LUN".
- Error (if any) while retrieving virtual disk details.

| [-vmdisk-backing-info]

Displays information about the backing disks on certain Data ONTAP-v models:

- Disk name
- Backing disk vendor
- Backing disk model
- Backing disk serial number
- Backing disk device id

| [-foreign] (privilege: advanced)

Displays the following foreign LUN import related information about foreign disks:

- Disk name
- Array name
- Capacity in sectors
- Capacity in mb
- Serial Number

| [-physical-location] (privilege: advanced)

Displays the following information about disks:

- Disk name
- Container type
- Primary path
- Location
- Home node name
- Physical size in human readable units

| [-primary-paths] (privilege: advanced)

Displays the following information about disks:

- Disk Name
- Shelf
- Bay
- Container Type
- Primary Path

| [-instance]

Displays detailed disk information. If no disk path name is specified, this parameter displays the same detailed information for all disks as does the -disk parameter. If a disk path name is specified, then this parameter displays the same detailed information for the specified disks as does the -disk parameter.

[-disk <disk path name>] - Disk Name

Displays detailed information about the specified disks. Disk names take one of the following forms:

- Disks are named in the form <stack-id>.<shelf>.<bay>
- Disks on multi-disk carriers are named in the form <stack-id>.<shelf>.<bay>.<lun>
- Virtual disks are named in the form <prefix>.<number>, where prefix is the storage array's prefix and number is a unique ascending number.

Disk names take one of the following forms on clusters that are not yet fully upgraded to Data ONTAP 8.3:

- Disks that are not attached to a switch are named in the form <node>:<host_adapter>.<loop_ID>. For disks with a LUN, the form is <node>:<host_adapter>.<loop_ID>L<LUN>. For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16Llun0.
- Disks that are attached to a switch are named in the form <node>:<switch_name>:<switch_port>.<loop_ID>. For disks with a LUN, the form is <node>:<switch_name>:<switch_port>.<loop_ID>L<LUN>. For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08Llun1.

Before the cluster is upgraded to Data ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique identifier (UUID) or serial number.

[-owner {<nodename>|local}] - Owner

Selects information about disks that are owned by the specified node.

[-owner-id <nvrmaid>] - Owner System ID

Selects the disks that are owned by the node with the specified system ID.

`[-is-foreign {true|false}] - Foreign LUN (privilege: advanced)`

Selects information about array LUNs that have been declared to be foreign LUNs.

`[-uid <text>] - Disk Unique ID`

Selects the disks whose unique id matches this parameter value. A disk unique identifier has the form:
20000000:875D4C32:00000000:00000000:00000000:00000000:00000000:00000000

`[-aggregate <aggregate name>] - Aggregate`

Selects information about disks that belong to the specified aggregate.

`[-array-name <array name>] - Array Name`

Selects information about the LUNs presented by the specified storage array.

`[-average-latency <integer>] - Average I/O Latency Across All Active Paths`

Selects information about disks that have the specified average latency.

`[-bay <integer>] - Bay`

Selects information about disks that are located in the carrier within the specified shelf bay.

`[-bps <integer>] - Bytes Per Sector`

Selects information about disks that have the specified number of bytes per sector. Possible settings are 512, 520, 4096, and 4160.

`[-carrier-id <text>] - Carrier ID`

Selects information about disks that are located within the specified multi-disk carrier.

`[-checksum-compatibility {advanced_zoned | block | none}] - Checksum Compatibility`

Selects information about disks that have the specified checksum compatibility.

`[-class {capacity | performance | archive | solid-state | array | virtual}] - Disk Class`

Selects information about disks that have the specified disk class.

- capacity = Capacity-oriented, near-line disk types. Includes disk types FSAS, BSAS and ATA.
- performance = Performance-oriented, enterprise class disk types. Includes disk types FCAL and SAS.
- archive = Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA.
- solid-state = Solid-state drives. Includes disk type SSD and SSD-NVM.
- array = Logical storage devices backed by storage arrays and used by Data ONTAP as disks. Includes disk type LUN.
- virtual = Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK.

`[-container-type {aggregate | broken | foreign | labelmaint | maintenance | mediator | remote | shared | spare | unassigned | unknown | unsupported}] - Container Type`

Selects information about disks that have the specified container type.

- Aggregate = Disk is used as a physical disk in an aggregate.
- Broken = Disk is in broken pool.
- Foreign = Array LUN has been marked foreign.
- Labelmaint = Disk is in online label maintenance list.
- Maintenance = Disk is in maintenance center.
- Mediator = A mediator disk is a disk used on non-shared HA systems hosted by an external node which is used to communicate the viability of the storage failover between non-shared HA nodes.
- Remote = Disk belongs to the remote cluster.
- Shared = Disk is partitioned or in a storage pool.
- Spare = Disk is a spare disk.
- Unassigned = Disk ownership has not been assigned.

- Unknown = Container is currently unknown. This is the default setting.
- Unsupported = Disk is not supported.

[-container-name <text>] - Container Name

Selects information about disks that have the specified container name. If a disk is in an aggregate or storage pool, the container name is the name of the aggregate or storage pool. Spare disks show the SyncMirror Pool to which they belong. Partitioned disks could return multiple aggregate names.

[-copy-destination <disk path name>] - Copy Destination Name

Selects information about disks whose contents are being copied (due to either Rapid RAID Recovery or disk replacement) to the specified spare disk.

[-copy-percent <integer>] - Percentage of Copy Complete

Selects information about disks that are involved as either a source or destination of a copy operation, (due to either disk replacement or Rapid RAID Recovery) and that have the specified percentage of the copy operation completed.

[-data-owner {<nodename>|local}] - Owner of Data Partition of Root-Data Partitioned Disk

Selects information about disks that have the specified data partition owner name. Used with root-data partitioned disks.

[-data1-owner {<nodename>|local}] - Owner of Data1 Partition of Root-Data1-Data2 Partitioned Disk

Selects information about disks that have the specified data1 partition owner name. Used with root-data1-data2 partitioned disks.

[-data2-owner {<nodename>|local}] - Owner of Data2 Partition of Root-Data1-Data2 Partitioned Disk

Selects information about disks that have the specified data2 partition owner name. Used with root-data1-data2 partitioned disks.

[-data-home {<nodename>|local}] - Home Owner of Data Partition of Root-Data Partitioned Disk

Selects information about disks that have the specified data partition home owner name. Used with root-data partitioned disks.

[-data1-home {<nodename>|local}] - Home Owner of Data1 Partition of Root-Data1-Data2 Partitioned Disk

Selects information about disks that have the specified data1 partition home owner name. Used with root-data1-data2 partitioned disks.

[-data2-home {<nodename>|local}] - Home Owner of Data2 Partition of Root-Data1-Data2 Partitioned Disk

Selects information about disks that have the specified data2 partition home owner name. Used with root-data1-data2 partitioned disks.

[-data-owner-id <nvrmaid>] - Owner System ID of Data Partition of Root-Data Partitioned Disk

Selects information about disks that have the specified data partition owner system ID. Used with root-data partitioned disks.

[-data1-owner-id <nvrmaid>] - Owner System ID of Data1 Partition of Root-Data1-Data2 Partitioned Disk

Selects information about disks that have the specified data1 partition owner system ID. Used with root-data1-data2 partitioned disks.

[-data2-owner-id <nvrmaid>] - Owner System ID of Data2 Partition of Root-Data1-Data2 Partitioned Disk

Selects information about disks that have the specified data2 partition owner system ID. Used with root-data1-data2 partitioned disks.

[-data-home-id <nvrmaid>] - Home Owner System ID of Data Partition of Root-Data Partitioned Disk

Selects information about disks that have the specified data partition home owner system ID. Used with root-data partitioned disks.

[-data1-home-id <nvr amid>] - Home Owner System ID of Data1 Partition of Root-Data1-Data2 Partitioned Disk

Selects information about disks that have the specified data1 partition home owner system ID. Used with root-data1-data2 partitioned disks.

[-data2-home-id <nvr amid>] - Home Owner System ID of Data2 Partition of Root-Data1-Data2 Partitioned Disk

Selects information about disks that have the specified data2 partition home owner system ID. Used with root-data1-data2 partitioned disks.

[-disk-io-kbps-total <integer>] - Total Disk Throughput in KBPS Across All Active Paths

Selects information about disks that have attained the specified I/O throughput on all connected paths.

[-disk-iops-total <integer>] - Total Disk IOPs Across All Active Paths

Selects information about disks that have achieved the specified number of IOPs per second on all connected paths.

[-diskpathnames <disk path name>, ...] - list of path based disk names

Selects information about disks that have all of the specified path names.

[-effective-rpm <integer>] - Effective RPM

Selects information about disks with the specified effective rotational speed.

[-dr-home {<noden ame>|local}] - Disaster Recovery Home

Selects information about disks that have the specified Disaster home node.

[-dr-home-id <nvr amid>] - Disaster Recovery Home System ID

Selects information about disks whose Disaster home node has the specified system id.

[-drawer <integer>] - Drawer

Selects information about disks that are located in the specified drawer.

[-error-type {on epath|on edomain|control|foreign|toobig|toosmall|invalidblocksize|targetasymmap|deviceasymmap|failovermisconfig|unknown|netapp|fwdownrev|qualfail|diskfail|notallflashdisk}, ...] - Error Type

Selects information about disks that have the specified error types.

- onepath = The array LUN is accessible only via a single path.
- onedomain = The array LUN is accessible only via a single fault domain.
- control = The array LUN cannot be used because it is a control device.
- foreign = The array LUN is marked as foreign and has some external SCSI reservations other than those from Data ONTAP.
- toobig = The array LUN exceeds the maximum array LUN size that Data ONTAP supports.
- toosmall = The array LUN is less than the minimum array LUN size that Data ONTAP supports.
- invalidblocksize = The array LUN is not a valid block size.
- targetasymmap = The array LUN is presented more than once on a single target port.
- deviceasymmap = The array LUN is presented with multiple IDs.
- failovermisconfig = The array LUN is configured with inconsistent failover methods.
- unknown = The array LUN from a storage array that is not supported by this version of Data ONTAP.
- netapp = A SAN front-end LUN from one Data ONTAP system that is presented as external storage to another Data ONTAP system.
- fwdownrev = The disk firmware is a down version.
- qualfail = The disk is not supported.
- diskfail = The disk is in a failed state.

- notallflashdisk = The disk does not match the All-Flash Optimized personality of the system.

[-firmware-revision <text>] - Firmware Revision

Selects information about disks that have the specified firmware revision level.

[-home {<nodename>|local}] - Home

Selects information about disks that have the specified home node.

[-home-id <nvr amid>] - Home System ID

Selects information about disks whose home node has the specified system ID.

[-host-adapter <text>] - Primary Path Host Adapter

Selects information about disks that are currently using the specified Host Bus Adapter.

[-hw-minimum-os <text>] - Hardware Minimum Supported Data ONTAP Version

Selects information about disks that have the specified hardware minimum supported Data ONTAP version.

[-import-in-progress {true|false}] - Foreign LUN import in progress

Selects information about the array LUNs that are currently being imported. If this parameter is specified, the command displays information only about the disk or disks that are currently being used for importing data.

[-initiator <text>, ...] - Initiator Port

Selects information about disks that are visible to the initiator specified. Disks that are not currently in use by that initiator are included.

[-initiator-iops <integer>, ...] - Number of IOPS on Initiator (Rolling Average)

Selects information about disks that are visible to an initiator that has executed the specified number of IOPS.

[-initiator-io-kbps <integer>, ...] - Kbytes of I/O per second on Initiator (Rolling Average)

Selects information about disks visible to an initiator that has executed I/O at the specified throughput.

[-initiator-lun-in-use-count <integer>, ...] - Number of LUNs in the in-use state on this initiator

Selects information about disks with a path through an initiator that has the specified in-use-count.

[-initiator-side-switch-port <text>, ...] - Initiator Side Switch Port

Selects information about disks that are visible to an initiator connected to the specified switch port.

[-is-multidisk-carrier {true|false}] - Multi Disk Carrier?

Selects information about disks that are located within a multi-disk carrier.

[-is-local-attach {true|false}] - Indicates If the Disk Is Local to This Cluster

Selects information about disks attached to the local(true) or remote(false) MetroCluster site.

[-location {<nodename>|local}] - Physical Location

Selects information about disks attached to the specified node.

[-location-id <nvr amid>] - The system ID of the node where the disk is attached

Selects information about disks attached to the node with the specified system ID.

[-lun <integer>, ...] - LUN ID

Selects information about the specified LUNs.

[-lun-iops <integer>, ...] - Number IOPS per second on disk (Rolling Average)

Selects information about the LUNs that have reached the specified number of IOPS.

[-lun-io-kbps <integer>, ...] - Kbytes/sec on Disk (Rolling Average)

Selects information about the LUNs that have reached the specified I/O throughput.

[-lun-path-use-state <text>, ...] - The Use State of the LUN on this path

Selects information about LUNs reporting the specified in-use state.

[-model <text>] - Model

Selects information about disks of the specified model.

[-nodelist <nodename>|local, ...] - Controller name

Selects information about disks that are visible to all of the specified nodes .

[-outage-reason <text>] - Outage Reason

Selects information about disks that are not in service for the specified reason. Possible values are: admin failed, admin removed, admin testing, evacuated, bad label, bypassed, failed, init failed, label version, labeled broken, labelmaint, LUN resized, missing, not responding, predict failure, rawsize shrank, recovering, sanitizing, sanitized, SnapLock Disk, testing, unassigned, unknown.

[-path-error-count <integer>] - Path Error Count

Selects information about disks that are visible on a path that has incurred the specified number of errors.

[-path-iops <integer>, ...] - Number of IOPS on Path (Rolling Average)

Selects information about disks on those paths that have reached the specified number of IOPs.

[-path-io-kbps <integer>, ...] - Kbytes of I/O per second on Path (Rolling Average)

Selects information about disk with paths that have reached the specified I/O throughput

[-path-link-errors <integer>, ...] - Link Error count on path

Selects information about disks with paths that have incurred the specified number of FC link errors.

[-path-lun-in-use-count <integer>, ...] - Number of LUNs in the in-use state on this path

Selects information about disks with paths that have the specified in-use-count.

[-path-quality <integer>, ...] - Percentage of weighted error threshold

Selects information about disks on paths that have incurred the specified number of errors. The value displayed is a measure of the health of a path expressed as a percentage of an error threshold. Once a path has reached or surpassed the error threshold, another path will be selected for I/O transfer, if there is one available.

[-physical-size-mb <integer>] - Physical Size (MB)

Selects information about disks that have the specified physical capacity, in megabytes.

[-physical-size <integer>[KB|MB|GB|TB|PB]] - Physical Size

Selects information about disks that have the specified physical capacity, in human readable units.

[-physical-size-512b <integer>] - Physical Size in Units of 512 Bytes

Selects information about disks that have the specified physical capacity, in 512-byte chunks. This parameter is present only for backwards compatibility with Data ONTAP 8.0.

[-plex <text>] - Plex Name

Selects information about disks that belong to the specified RAID plex.

[-pool <text>] - Assigned Pool

Selects information about disks that belong to the specified SyncMirror pool (pool0 or pool1).

[-port-speed <text>, ...] - Port Speed

Selects information about disks that are served by a Host Bus Adapter that is running at the specified port speed.

[-position <diskPositionType>] - Disk Position

Selects information about disks that have the specified position within their disk container.

[-power-on-hours <integer>] - Hours Powered On

Selects information about disks that have the specified number of hours being powered up.

[-prefailed {true|false}] - Marked for Rapid RAID Recovery?

Selects information about disks that match the specified parameter value indicating whether the disk is either awaiting or is in process of Rapid RAID Recovery.

[-preferred-target-port {true|false}, ...] - Whether or not target port group is preferred (privilege: advanced)

Selects information about disks that match the specified parameter value indicating whether the backing storage is ALUA (Asymmetric Logical Unit Access) capable and has specified the array target port on this path to be a preferred target port for I/O.

[-primary-port <text>] - Primary Path Disk Port

Selects information about disks that use the specified primary port.

[-raid-group <text>] - Raid Group Name

Selects information about disks that belong to the specified RAID group.

[-reconstruction-percent <integer>] - Percentage of Reconstruction Complete

Selects information about disks that are being reconstructed and that have the specified percentage of the reconstruction operation completed.

[-replacing {true|false}] - Being Replaced?

Selects information about disks that match the specified boolean value indicating whether the disk is either awaiting or in process of disk replacement.

[-reservation-key <text>] - Reservation Key

If this parameter is specified, the command displays information only about the disk or disks that have the specified persistent reservation key.

[-reservation-type {rs|we|re|ea|sa|wero|earo|wear|ear|none}] - Reservation Type

If this parameter is specified, the command displays information only about the disk or disks that have the specified persistent reservation type. Possible values are: rs, we, re, ea, sa, wero, earo, wear, ear, or none.

[-reserver-id <integer>] - Reservation System ID

Selects information about disks that are reserved by the node with the specified system ID.

[-root-owner {<nodename>|local}] - Owner of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk

Selects information about disks that have the specified root partition owner name. Used with root-data/root-data1-data2 partitioned disks.

[-root-owner-id <nvramid>] - Owner System ID of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk

Selects information about disks that have the specified root partition owner system ID. Used with root-data/root-data1-data2 partitioned disks.

[-root-home {<nodename>|local}] - Home Owner of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk

Selects information about disks that have the specified root partition home owner name. Used with root-data/root-data1-data2 partitioned disks.

[-root-home-id <nvramid>] - Home Owner System ID of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk

Selects information about disks that have the specified root partition home owner system ID. Used with root-data/root-data1-data2 partitioned disks.

[-rpm <integer>] - Revolutions Per Minute

Selects information about disks that have the specified rotational speed.

[-secondary-name <disk path name>] - Secondary Path Name

Selects information about disks that use the specified secondary path name, for multipath configuration.

[-secondary-port <text>] - Secondary Path Disk Port

Selects information about disks that use the specified secondary port.

[-serial-number <text>] - Serial Number

Selects information about the disk that has the specified serial number.

[-storage-pool <text>] - Storage Pool Name

Selects information about disks that belong to the specified SSD storage pool.

[-shelf <integer>] - Shelf

Selects information about disks that are located within the specified shelf.

[-shelf-uid <text>] - Shelf UID

Selects information about disks that are located within a shelf with the specified Shelf UID.

[-slot <integer>] - Slot

Selects information about disks that are located in a drawer with the specified slot.

[-stack-id <integer>] - Stack ID

A cluster unique id for a collection of one or more interconnected shelves.

[-target-iops <integer>, ...] - Number of IOPS to Target (Rolling Average)

Selects information about disks that are visible on target ports that have performed the specified number of IOPs.

[-target-io-kbps <integer>, ...] - Kbytes of I/O per second to Target (Rolling Average)

Selects information about disks that are visible on target ports that have reached the specified I/O throughput.

[-target-lun-in-use-count <integer>, ...] - Number of LUNs in the in-use state on this target

Selects information about disks with a path through a target port that has the specified in-use-count.

[-target-port-access-state <text>, ...] - Failover optimization type

Selects information about disks that are visible on target ports that have the specified access state.

[-target-side-switch-port <text>, ...] - Target Side Switch Port

Selects information about disks that are visible on target ports identified by the switch port to which they are connected.

[-target-wwpn <text>, ...] - Target Port

Selects information about disks that are visible on target ports identified by their World Wide Port Name.

[-tpgn <integer>, ...] - Target Port Group Number

Selects information about disks that belong to the specified Target Port Group Number.

[-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM}] - Disk Type

Selects information about disks that have the specified disk type.

[-usable-size-mb <integer>] - Usable Size (MB)

Selects information about disks that have the specified usable space, in megabytes.

[-usable-size {<integer>[KB|MB|GB|TB|PB]}] - Usable Size

Selects information about disks that have the specified usable space, in human readable units.

[-vendor <text>] - Vendor Name

Selects information about disks that have the specified vendor.

[-vmdisk-device-id <integer>, ...] - Virtual Disk Device ID

Selects information about disks that have the specified virtual disk device ID.

[-zeroed {true|false}] - Zeroed?

Selects information about disks that have (true) or have not (false) been fully pre-zeroed.

[-zeroing-percent <integer>] - Percentage of Zeroing Complete

Selects information about disks that are zeroing and have the specified percentage complete.

[-carrier-serialno <text>] - Carrier Serial Number

Selects information about disks that are located within the multi-disk carrier specified by the serial number.

[-vmdisk-target-address <text>] - Target address of the vmdisk

Displays the vmdisk's target address either in the form of bus target lun or bus unit.

Examples

The following example displays information about all disks:

```
cluster1::> storage disk show
```

Disk	Usable Size	Shelf	Bay	Container Type	Position	Aggregate	Owner
1.1.1	10GB	1	1	spare	present	-	node1
1.1.4	78.59GB	1	4	spare	present	-	node1
1.1.12	10GB	1	12	spare	present	-	node1
1.2.12	10GB	2	12	broken	present	-	node1
1.3.7	78.59GB	3	7	aggregate	parity	aggr0_u23	node1
1.1.6	78.59GB	1	6	broken	present	-	node1
1.2.10	78.59GB	2	10	aggregate	dparity	aggr0_u23	node1
1.4.9	78.59GB	4	9	aggregate	data	aggr0_u23	node1
1.1.0	10GB	1	0	aggregate	dparity	aggr0_u22	node2
1.4.1	10GB	4	1	aggregate	data	dp_degraded	node2
1.1.2	10GB	1	2	spare	present	-	node2
1.1.3	20GB	1	3	spare	present	-	node2
1.4.4	20GB	4	4	spare	present	-	node2
1.4.6	10GB	4	6	aggregate	data	dp_sdc	node2
1.1.5	268.0GB	1	5	maintenance	present	-	node2
1.3.0	10GB	3	0	aggregate	parity	aggr0_u22	node2
1.4.11	10GB	4	11	spare	present	-	node2
1.4.13	20GB	4	13	broken	present	-	node2

[...]

The following example displays detailed information about a disk named 1.0.75

```
cluster1::> storage disk show -disk 1.0.75
Disk: 1.0.75
Container Type: spare
Owner/Home: node2 / node2

```

storage disk unfail

Unfail a broken disk

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage disk unfail` command can be used to unfail a broken disk.

If the attempt to unfail the disk is unsuccessful, the disk remains in the broken state.

The disk unfail command prompts for confirmation unless you specify the "-quiet" parameter.

Parameters

-disk <disk path name> - Disk Name

This parameter specifies the disk to be unfailed.

[-spare | -s [true]] - Make the Disk Spare

This parameter specifies whether the unfailed disk will be made a spare disk. The disk is forced to become a spare disk if this parameter is specified.

If this parameter is not specified, the disk is brought back into its parent aggregate. Setting this parameter might result in the aggregate coming back online if it is not complete or online. The default value is false.

[-quiet | -q *[true]*] - Confirmations off

You can set this parameter to true to suppress the confirmation messages. However, before proceeding with the command, you should be aware that the confirmation message contains important information about the effect of unfailed a disk. This command cannot be reversed once it is invoked. The default value is false.

Examples

The following example unfailed a disk named 1.1.16 to become a spare disk:

```
cluster1::*> storage disk unfailed -disk 1.1.16 -spare
```

storage disk updatefirmware

(DEPRECATED) - Update disk firmware

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command is deprecated and may be removed in a future release of Data ONTAP. Use the "[storage disk firmware update](#)" on page 895" command.

The `storage disk updatefirmware` command updates the firmware on one or more disks. You can download the latest firmware by using the "[storage firmware download](#)" on page 941 command. You can specify a list of one or more disks whose firmware is to be updated by using the `-disk` parameter, or you can update the firmware on all local disks by omitting the `-disk` parameter.

Parameters

[-disk <disk path name>, ...] - Disk

This specifies the disk or disks whose firmware is to be updated.

If you do not specify this option, all local disks' firmware is updated.

Examples

The following example updates the firmware on all disks:

```
cluster1::> storage disk updatefirmware
```

storage disk zerospares

Zero non-zeroed spare disks

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage disk zerospares` command zeroes all non-zeroed spare disks in all nodes or a specified node in the cluster. A node must be online to zero disks. This operation must be done before a disk can be reused in another aggregate. This version of ONTAP uses fast zeroing, which converts a spare disk from non-zeroed to zeroed without the long wait times required when physically zeroing a disk.

Parameters

[-owner {<nodename>|local}] - Owner

If this parameter is specified, only non-zeroed spares assigned to the specified node will be zeroed. Otherwise, all non-zeroed spares in the cluster will be zeroed.

Examples

The following example zeroes all non-zeroed spares owned by a node named node4, using fast zeroing:

```
cluster1::> storage disk zerospares -owner node4
```

The following example zeroes all non-zeroed spares owned by a node named node2 by physically writing zeros to the entire disk:

```
cluster1::> storage disk zerospares -owner node2 -use-physical-zeroing
```

storage disk error commands

The error directory

storage disk error show

Display disk component and array LUN configuration errors.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage disk error show` command displays disk component and array LUN configuration errors.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-uid <text>] - UID

Displays the error information of the disk whose unique ID matches the value you specify. A disk unique identifier has the form:

```
20000000:875D4C32:00000000:00000000:00000000:00000000:00000000:00000000:00000000
```

[-array-name <array name>] - Array Name

Displays the errors of the storage array whose name you specified.

[-node {<nodename>|local}] - Controller Name

Displays the error information for the disks on the clustered node whose name you specified.

[-disk <disk path name>] - Disk

Displays detailed error information about the disk you specified.

[-serial-number <text>] - Serial Number

Displays the error information for the disk whose serial number you specified.

[-error-id <integer>, ...] - Error ID

Displays the error information for the disks whose Error IDs match IDs you specified.

[-error-type {onepath|onedomain|control|foreign|toobig|toosmall|invalidblocksize|targetasymmap|deviceasymmap|failovermisconfig|unknown|netapp|fwdownrev|qualfail|diskfail|notallflashdisk}, ...] - Error Type

Displays all disk errors of the error types you specified, grouped by type.

- onepath = The array LUN is accessible only via a single path.

- onedomain = The array LUN is accessible only via a single fault domain.
- control = The array LUN cannot be used because it is a control device.
- foreign = The array LUN is marked as foreign and has some external SCSI reservations other than those from Data ONTAP.
- toobig = The array LUN exceeds the maximum array LUN size that Data ONTAP supports.
- toosmall = The array LUN is less than the minimum array LUN size that Data ONTAP supports.
- invalidblocksize = The array LUN is not a valid block size.
- targetasymmap = The array LUN is presented more than once on a single target port.
- deviceasymmap = The array LUN is presented with multiple IDs.
- failovermisconfig = The array LUN is configured with inconsistent failover methods.
- unknown = The array LUN from a storage array that is not supported by this version of Data ONTAP.
- netapp = A SAN front-end LUN from one Data ONTAP system that is presented as external storage to another Data ONTAP system.
- fwdownrev = The disk firmware is a down version.
- qualfail = The disk is not supported.
- diskfail = The disk is in a failed state.
- notallflashdisk = The disk does not match the All-Flash Optimized personality of the system.

Examples

The following example displays configuration errors seen in the system:

```
cluster1::> storage disk error show
Disk          Error Type      Error Text
-----
1.02.0        qualfail        This disk failed dynamic disk qualification. Update the Disk Qualification Package.
```

storage disk firmware commands

The firmware directory

storage disk firmware revert

Revert disk firmware

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage disk firmware revert` command reverts firmware on all disks or a specified list of disks on a node.

You can specify a list of one or more disks whose firmware is to be reverted by using the `-disk` parameter.

You can revert the firmware on all the disks owned by a node by using the `-node` parameter.

This command can make the disks inaccessible for up to five minutes after the start of its execution. Therefore, the network sessions that use the concerned node must be terminated before running the `storage disk firmware revert` command. This is particularly true for CIFS sessions that might be terminated when this command is executed.

If you need to view the current firmware versions, use the [“storage disk show” on page 874](#) -fields *firmware-revision* command. The following example displays partial output from the [“storage disk show” on page 874](#) -fields *firmware-revision* command, where the firmware version for the disks is NA02:

```
cluster1:: storage disk show -fields firmware-revision
disk      firmware-revision
-----
1.0.0     NA02
1.0.1     NA02
1.0.2     NA02
1.0.3     NA02
1.0.4     NA02
1.0.5     NA02
```

The firmware files are stored in the /mroot/etc/disk_fw directory on the node. The firmware file name is in the form of "product-ID.revision.LOD". For example, if the firmware file is for Seagate disks with product ID X225_ST336704FC and the firmware version is NA01, the file name is X225_ST336704FC.NA01.LOD. If the node in this example contains disks with firmware version NA02, the /mroot/etc/disk_fw/X225_ST336704FC.NA01.LOD file is downloaded to every disk when you execute this command.

How to Revert the Firmware for an HA Pair in a Cluster

Use the following procedure to perform a revert on the disks in an HA environment:

- Make sure that the nodes are not in takeover or giveback mode.
- Download the latest firmware on both nodes by using the [“storage firmware download” on page 941](#) command.
- Revert the disk firmware on Node A's disks by entering the `storage disk firmware revert -node node-A` command.
- Wait until the `storage disk firmware revert` command completes on Node A, and then revert the firmware on Node B's disks by entering the `storage disk firmware revert -node node-B` command.

Parameters

{ -disk <disk path name>, ... - Disk Name

Specifies the disk or disks whose firmware is to be reverted.

| -node {<nodename>|local}} - Node Name

Specifies the node name. The disk firmware will be reverted on all the disks owned by the node specified by this parameter.

Examples

If you need to view the current firmware versions, use the [“storage disk show” on page 874](#) -fields *firmware-revision* command. The following example displays partial output from the [“storage disk show” on page 874](#) -fields *firmware-revision* command, where the firmware version for the disks is NA02:

```
cluster1:: storage disk show -fields firmware-revision
disk      firmware-revision
-----
1.0.0     NA02
1.0.1     NA02
1.0.2     NA02
1.0.3     NA02
1.0.4     NA02
1.0.5     NA02
```

The following example reverts the firmware on all disks owned by cluster-node-01:

```
cluster1:* storage disk firmware revert -node cluster-node-01
```

Warning: Disk firmware reverts can be disruptive to the system. Reverts involve power cycling all of the affected disks, as well as suspending disk I/O to the disks being reverted. This delay can cause client disruption. Takeover/giveback operations on a high-availability (HA) group will be delayed until the firmware revert process is complete. Disk firmware reverts should only be done one node at a time. Disk

firmware reverts can only be performed when the HA group is healthy;
they cannot be performed if the group is in takeover mode.

Do you want to continue with disk firmware reverts? [y|n]: y

Info: Reverting disk firmware for disks on cluster-node-01.

The following example reverts the firmware on disk 1.5.0 which is owned by node cluster-node-04:
cluster1::* storage disk firmware revert -disk 1.5.0

Warning: Disk firmware reverts can be disruptive to the system. Reverts involve power cycling all of the affected disks, as well as suspending disk I/O to the disks being reverted. This delay can cause client disruption. Takeover/giveback operations on a high-availability (HA) group will be delayed until the firmware revert process is complete. Disk firmware reverts should only be done one node at a time. Disk firmware reverts can only be performed when the HA group is healthy; they cannot be performed if the group is in takeover mode.

Do you want to continue with disk firmware reverts? [y|n]: y

Info: Reverting disk firmware for disks on cluster-node-04.

storage disk firmware show-update-status

Display disk firmware update status.

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage disk firmware show-update-status` command displays the state of the background disk firmware update process.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node

Selects the node that matches this parameter value.

[-num-waiting-download <integer>] - The Number of Disks Waiting to Download

Selects the nodes whose number of disks waiting to download by the BDFU process matches this parameter value.

[-total-completion-estimate <integer>] - Estimated Duration to Completion (mins)

Selects the nodes whose Background Disk Firmware Update (BDFU) completion time estimate matches this parameter value. This indicates the amount of estimated time required for BDFU to complete the firmware update cycle.

[-average-duration-per-disk <integer>] - Average Firmware Update Duration per Disk (secs)

Selects the nodes whose BDFU reports the average time required to update a single disk matches this parameter value. This indicates the average amount of time required by each disk drive.

[-unable-to-update <disk path name>, ...] - List of Disks with a Failed Update

Selects the nodes whose unable to update disk list matches this parameter value. This is a list of disks that failed to update the firmware.

[-update-status {off|running|idle}] - Background Disk Firmware Update Status

Selects the nodes whose BDFU process status matches this parameter value. Possible values are:

- off - The BDFU process is off.

- running - The BDFU process is on and currently running.
- idle - The BDFU process is on and is currently idle.

Examples

```
cluster1::*> storage disk firmware show-update-status
```

Node	Update State	Number Waiting Download	Average Duration /Disk (Sec)	Completion Est. (Min)	Total Unable to Update
node1	running	2	120	4	1.3.3
node2	idle	0	120	0	-
node3	off	0	120	0	-

storage disk firmware update

Update disk firmware

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Use the `storage disk firmware update` command to manually update firmware on all disks or a specified list of disks on a node. However, the recommended way to update disk firmware in a cluster is to enable automatic background firmware update by enabling the `-bkg-firmware-update` parameter for all of the nodes in the cluster. You can do this by entering the [“storage disk option modify” on page 898](#) `-node * -bkg-firmware-update on` command.

You can download the latest firmware on the node by using the [“storage firmware download” on page 941](#) command.

You can specify a list of one or more disks whose firmware is to be updated by using the `-disk` parameter.

You can update the firmware on all the disks owned by a node by using the `-node` parameter.

This command can make the disks inaccessible for up to five minutes after the start of its execution. Therefore, the network sessions that use the concerned node must be terminated before running the `storage disk firmware update` command. This is particularly true for CIFS sessions that might be terminated when this command is executed.

The firmware is automatically downloaded to disks, which report previous versions of the firmware. For information on automatic firmware update downloads, see "Automatic versus Manual Firmware Download".

If you need to view the current firmware versions, use the [“storage disk show” on page 874](#) `-fields firmware-revision` command. The following example displays partial output from the [“storage disk show” on page 874](#) `-fields firmware-revision` command, where the firmware version for the disks is NA01:

```
cluster1:: storage disk show -fields firmware-revision
```

disk	firmware-revision
1.0.0	NA01
1.0.1	NA01
1.0.2	NA01
1.0.3	NA01
1.0.4	NA01
1.0.5	NA01

The firmware files are stored in the `/mroot/etc/disk_fw` directory on the node. The firmware file name is in the form of "product-ID.revision.LOD". For example, if the firmware file is for Seagate disks with product ID X225_ST336704FC and the firmware version is NA02, the filename is X225_ST336704FC.NA02.LOD. The revision part of the file name is the number against which the node compares each disk's current firmware

version. If the node in this example contains disks with firmware version NA01, the /mroot/etc/disk_fw/X225_ST336704FC.NA02.LOD file is used to update every eligible disk when you execute this command.

Automatic versus Manual Firmware Download

The firmware is automatically downloaded to those disks that report previous versions of firmware following a system boot or disk insertion. Note that:

- A manual download is a disruptive operation that makes disks inaccessible for up to five minutes after the download is started. Network sessions that use the node must be terminated before running the `storage disk firmware update` command.
- The firmware is not automatically downloaded to the node's partner node in an HA pair.
- The firmware is not automatically downloaded to unowned disks on nodes configured to use software-based disk ownership.
- The `bkg-firmware-update` parameter controls how the automatic firmware download feature works:
 - If the `bkg-firmware-update` parameter is set to off, then the `storage disk firmware update` will update the firmware on the drives in parallel.
 - If the `bkg-firmware-update` parameter is set to on, then the `storage disk firmware update` will update spares and filesystem disks in a nondisruptive manner in the background after boot. Firmware downloads for these disks will be done sequentially by temporarily taking them offline one at a time for the duration of the download. After the firmware is updated, the disk will be brought back online and restored to its normal operation.

During an automatic download to an HA environment, the firmware is not downloaded to the disks owned by the HA partner.

When you use the `storage disk firmware update` command, the firmware is:

- Updated on every disk regardless of whether it is on the A-loop, the B-loop, or in an HA environment.
- If the node is configured in a software-based disk ownership system, only disks owned by this node are updated.

Follow the instructions in "How to Update the Firmware for an HA Pair in a Cluster" to ensure that the updating process is successful. Data ONTAP supports redundant path configurations for disks in a non-HA configuration. The firmware is automatically downloaded to disks on the A-loop or B-loop of redundant configurations that are not configured in an HA pair and are not configured to use software-based disk ownership.

Automatic Background Firmware Update

The firmware can be updated in the background so that the firmware update process does not impact the clients. This functionality is controlled with the `bkg-firmware-update` parameter. You can modify the parameter by using the CLI [“storage disk option modify” on page 898](#) -node *node_name* -bkg-firmware-update on|off command. The default value for this parameter is "on".

When disabled or set to "off", `storage disk firmware update` will update the firmware in automated mode. This means that all disks which had older firmware revision will be updated regardless of whether they are spare or filesystem disks.

When enabled or set to "on", the background `storage disk firmware update` will update firmware in automated mode only on disks that can be successfully taken offline from active filesystem RAID groups and from the spare pool. To ensure a faster boot process, the firmware is not downloaded to spares and filesystem disks at boot time.

This provides the highest degree of safety available, without the cost of copying data from each disk in the system twice. Disks are taken offline one at a time and then the firmware is updated on them. The disk is brought online after the firmware update and a mini/optimized reconstruct happens for any writes, which occurred while the disk was offline. Background disk firmware update will not occur for a disk if its containing RAID group or the volume is not in a normal state (for example, if the volume/plex is offline or the RAID group is degraded). However, due to the continuous polling nature of background disk firmware update, firmware updates will resume after the RAID group/plex/volume is restored to a normal mode. Similarly, background disk firmware updates are suspended for the duration of any reconstruction within the system.

How to Update the Firmware for an HA Pair in a Cluster

The best way to update the firmware in a cluster with HA pairs is to use automatic background firmware update by enabling the option `bkg-firmware-update` parameter for each node. Enable the `-bkg-firmware-update` parameter on all the nodes by entering the [“storage disk option modify” on page 898](#) `-node node_name -bkg-firmware-update on` command. Alternatively, use the following procedure to successfully perform a manual update on the disks in an HA environment:

- Make sure that the nodes are not in takeover or giveback mode.
- Download the latest firmware on both the nodes by using the [“storage firmware download” on page 941](#) command.
- Install the new disk firmware on Node A's disks by entering the `storage disk firmware update -node node-A` command.
- Wait until the `storage disk firmware update` command completes on Node A, and then install the new disk firmware on Node B's disks by entering the `storage disk firmware update -node node-B` command.

Parameters

{ -disk <disk path name>, ... - Disk

Specifies the disk or disks whose firmware is to be updated.

| -node {<nodename>|local}} - node

Specifies the node name. The disk firmware will be updated on all the disks owned by the node specified by this parameter.

Examples

If you need to view the current firmware versions, use the [“storage disk show” on page 874](#) `-fields firmware-revision` command. The following example displays partial output from the [“storage disk show” on page 874](#) `-fields firmware-revision` command, where the firmware version for the disks is NA01:

```
cluster1:: storage disk show -fields firmware-revision
disk      firmware-revision
-----
1.0.0     NA01
1.0.1     NA01
1.0.2     NA01
1.0.3     NA01
1.0.4     NA01
1.0.5     NA01
```

The following example updates the firmware on all disks owned by cluster-node-01:

```
cluster1:* storage disk firmware update -node cluster-node-01
```

```
Warning: Disk firmware updates can be disruptive to the system. Updates involve
power cycling all of the affected disks, as well as suspending disk
I/O to the disks being updated. This delay can cause client
disruption. Takeover/giveback operations on a high-availability (HA)
group will be delayed until the firmware update process is complete.
Disk firmware updates should only be done one node at a time. Disk
firmware updates can only be performed when the HA group is healthy;
they cannot be performed if the group is in takeover mode.
```

```
Do you want to continue with disk firmware updates? [y|n]: y
```

```
Info: Updating disk firmware for disks on cluster-node-01.
```

The following example updates the firmware on disk 1.5.0 which is owned by node cluster-node-04:

```
cluster1::* storage disk firmware update -disk 1.5.0
```

Warning: Disk firmware updates can be disruptive to the system. Updates involve power cycling all of the affected disks, as well as suspending disk I/O to the disks being updated. This delay can cause client disruption. Takeover/giveback operations on a high-availability (HA) group will be delayed until the firmware update process is complete. Disk firmware updates should only be done one node at a time. Disk firmware updates can only be performed when the HA group is healthy; they cannot be performed if the group is in takeover mode.

Storage disk option Command

Manage disk options

The `storage disk option` command displays or modifies the settings of disk options.

storage disk option modify

Modify disk options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage disk option modify` command modifies the background firmware update setting, automatic copy setting, controls automatic disk assignment of all disks assigned to a specified node, or modifies the policy of automatic disk assignment of unowned disks.

Parameters

-node {<nodename>|local} - Node

This parameter specifies the node that owns the disks whose options are to be modified.

[-bkg-firmware-update {on|off}] - Background Firmware Update

This parameter specifies whether firmware updates run as a background process. The default setting is `on`, which specifies that firmware updates to spare disks and file system disks is performed nondisruptively via a background process. If the option is turned off, automatic firmware updates occur at system startup or during disk insertion.

[-autocopy {on|off}] - Auto Copy

This parameter specifies whether data is to be automatically copied from a failing disk to a spare disk in the event of a predictive failure. The default setting is `on`. It is sometimes possible to predict a disk failure based on a pattern of recovered errors that have occurred. In such cases, the disk reports a predictive failure. If this option is set to `on`, the system initiates Rapid RAID Recovery to copy data from the failing disk to an available spare disk. When data is copied, the disk is marked as failed and placed in the pool of broken disks. If a spare is not available, the node continues to use the disk until it fails. If the option is set to `off`, the disk is immediately marked as failed and placed in the pool of broken disks. A spare is selected and data from the missing disk is reconstructed from other disks in the RAID group. The disk does not fail if the RAID group is already degraded or is being reconstructed. This ensures that a disk failure does not lead to the failure of the entire RAID group.

[-autoassign {on|off}] - Auto Assign

This parameter specifies whether automatic assignment of unowned disks is enabled or disabled. The default setting is `on`. This parameter is used to set both a node-specific and a cluster-wide disk option.

[-autoassign-policy {default|bay|shelf|stack}] - Auto Assignment Policy

This parameter defines the granularity at which auto assign should work. This option is ignored if the `-autoassign` option is off. Auto assignment can be done at the stack/loop, shelf, or bay level. The possible values for the option are default, stack, shelf, and bay. The default value is platform dependent. It is stack for all non-entry platforms and single-node systems, whereas it is bay for entry-level platforms.

Examples

The following example sets the background firmware update setting to on for all disks belonging to a node named `node0`:

```
cluster1::> storage disk option modify -node node0 -bkg-firmware-update on
```

The following example shows how to enable auto assignment for the disks on `node1`:

```
cluster1::> storage disk option modify -node node1 -autoassign on
cluster1::> storage disk option show
```

Node	BKg. FW. Upd.	Auto Copy	Auto Assign	Auto Assign Policy
node1	on	on	on	default
node2	on	on	off	default

2 entries were displayed.

The following example shows how to modify the auto assignment policy on `node1`:

```
cluster1::> storage disk option modify -node node1 -autoassign-policy bay
cluster1::> storage disk option show
```

Node	BKg. FW. Upd.	Auto Copy	Auto Assign	Auto Assign Policy
node1	on	on	on	bay
node2	on	on	off	default

2 entries were displayed.

storage disk option show

Display a list of disk options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage disk option show` command displays the settings of the following disk options:

- Background firmware update
- Automatic copying of data to a spare disk in the event of a predictive failure
- Automatic assignment of disks
- Policy that governs automatic assignment of unowned disks

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the node that owns the disks. If this parameter is not specified, the command displays information about the disk options on all the nodes.

[-bkg-firmware-update {on|off}] - Background Firmware Update

Selects the disks that match this parameter value.

[-autocopy {on|off}] - Auto Copy

Selects the disks that match this parameter value.

[-autoassign {on|off}] - Auto Assign

Displays the auto assignment status of unowned disks. The default value is `on`.

[-autoassign-policy {default|bay|shelf|stack}] - Auto Assignment Policy

Selects the disks that match the automatic assignment policy value:

- Default
- Stack/loop
- Shelf
- Bay

Examples

The following example displays disk-option settings for disks owned by all nodes in the cluster:

```
cluster1::> storage disk option show
Node      BKg. FW. Upd.  Auto Copy  Auto Assign Auto Assign Policy
-----
node0      on             on         ondefault
node1      on             on         onstack
node2      on             on         onbay
node3      on             on         onbay
4 entries were displayed.
```

storage encryption commands

The encryption directory

storage encryption disk commands

Manage encryption objects for self-encrypting disks

storage encryption disk destroy

Cryptographically destroy a self-encrypting disk

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage encryption disk destroy` command cryptographically destroys a self-encrypting disk (SED), making it incapable of performing I/O operations. This command performs the following operations:

- Employs the inherent erase capability of SEDs to cryptographically sanitize the disk
- Permanently locks the disk to prevent further data access
- Changes the data and FIPS authentication keys to random values that are not recorded except within the SED.

Use this command with extreme care. The only mechanism to restore the disk to usability (albeit without the data) is the [“storage encryption disk revert-to-original-state” on page 903](#) operation that is available only on disks that have the physical secure ID (PSID) printed on the disk label.

The destroy command requires you to enter a confirmation phrase before proceeding with the operation.

The command releases the cluster shell after launching the operation. Monitor the output of the [“storage encryption disk show-status” on page 907](#) command for command completion.

Upon command completion, remove the destroyed SED from the system.

Parameters

-disk <disk path name> - Disk Name

This parameter specifies the name of the disk you want to cryptographically destroy. See the man page for the storage disk modify command for information about disk-naming conventions.

[-force-all-states [true]] - Destroy All Matching Disks

When this parameter is *false* or not specified, the operation defaults to spare and broken disks only, as reported in the output of the [“storage disk show” on page 874](#) command. When you specify this parameter as *true*, it allows you to cryptographically destroy all matching disk names regardless of their state, including those in active use in aggregates. This allows a quick destroy of all system disks if you use the -disk parameter with the asterisk wildcard (*). If you destroy active disks, the nodes might not be able to continue operation, and might halt or panic.

Examples

The following command cryptographically destroys the disk 1.10.20:

```
cluster1::> storage encryption disk destroy 1.10.20

Warning: This operation will cryptographically destroy 1 spare or broken
self-encrypting disks on 1 node.
You cannot reuse destroyed disks unless you revert
them to their original state using the PSID value.
To continue, enter
  destroy disk
:destroy disk

Info: Starting destroy on 1 disk.
View the status of the operation by using the
"storage encryption disk show-status" command.
```

```
cluster1::>
```

If you do not enter the correct confirmation phrase, the operation is aborted:

```
cluster1::> storage encryption disk destroy 1.10.2*

Warning: This operation will cryptographically destroy 5 spare or broken
self-encrypting disks on 1 node.
You cannot reuse destroyed disks unless you revert
them to their original state using the PSID value.
To continue, enter
  destroy disk
:yes
No disks destroyed.

cluster1::>
```

The following command quickly cryptographically destroys all system disks:

```
cluster1::> storage encryption disk destroy -force-all-states -disk *

Warning: This operation will cryptographically destroy 96
self-encrypting disks on 4 nodes.
To continue, enter
  destroy disk
:destroy disk

Info: Starting destroy on 96 disks.
View the status of the operation by using the
“storage encryption disk show-status” on page 907 command.

cluster1::>
```

storage encryption disk modify

Modify self-encrypting disk parameters

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage encryption disk modify` command changes the data and FIPS-compliance protection parameters of self-encrypting disks (SEDs). The current data AK and FIPS AK of the SED are required to effect changes to the respective AKs and FIPS compliance, and must also be available from the key servers.

The command releases the cluster shell after launching the operation. Monitor the output of the [“storage encryption disk show-status” on page 907](#) command for command completion.

Note: To properly protect data at rest on a SED and place it into compliance with its FIPS certification requirements, set both the Data and FIPS-compliance AKs to a value other than the device's default key; depending on the device type, the default may be manufacture secure ID (MSID), indicated by a key ID with the special value `0x0`, or a null key represented by a blank AK. Verify the key IDs by using the [“storage encryption disk show” on page 905](#) and `storage encryption disk show-fips` commands.

Parameters

-disk <disk path name> - Disk Name

This parameter specifies the name of the SED that you want to modify.

{ [-data-key-id <text>] - Key ID of the New Data Authentication Key

This parameter specifies the key ID associated with the data AK that you want the SED to use for future authentications. When the provided key ID is the MSID, data at rest on the SED is not protected from unauthorized access. Setting this parameter to a non-MSID value automatically engages the power-on-lock protections of the device, so that when the device is power-cycled, the system must authenticate with the device using the AK to reenale I/O operations. You cannot specify the null default key; use MSID instead.

| [-fips-key-id <text>]} - Key ID of the New Authentication Key for FIPS Compliance

This parameter specifies the key ID associated with the FIPS AK that you want the SED to apply to SED credentials other than the one that protects the data. When the value is not the MSID, these credentials are changed to the indicated AK, and other security-related items are set to conform to the FIPS certification requirements ("FIPS compliance mode") of the device. You may set the `-fips-key-id` to any one of the key IDs known to the system. The FIPS key ID may, but does not have to, be the same as the data key ID parameter. Setting `-fips-key-id` to the MSID key ID value disables FIPS compliance mode and restores the FIPS-related authorities and other components as required (other than data) to their default settings. The MSID is required when reverting to a version of Data ONTAP that does not manipulate the FIPS-compliance device components.

Examples

The following command changes both the AK and the power-cycle protection to values that protect the data at rest on the disk. Note that the `-data-key-id` and `-fips-key-id` parameters require one of the key IDs that appear in the output of the [“security key-manager query” on page 480](#) command.

```
cluster1::> storage encryption disk modify -data-key-id 6A1E21D800000000010000000000000F5A1EB48EF26FD6A8E76549C019F2350 -disk 2.10.*
```

```
Info: Starting modify on 14 disks.  
      View the status of the operation by using the  
      storage encryption disk show-status command.
```

The following command changes the FIPS AK and sets the device into FIPS-compliance mode. Note that the `-fips-key-id` parameter requires one of the key IDs that appear in the output of the [“security key-manager query” on page 480](#) command.

```
cluster1::> storage encryption disk modify -fips-key-id 6A1E21D800000000100000000000005A1FB4EE8F62FD6D8AE6754C9019F35A 2.10.*
```

Info: Starting modify on 14 disks.
View the status of the operation by using the
storage encryption disk show-status command.

storage encryption disk revert-to-original-state

Revert a self-encrypting disk to its original, as-manufactured state

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Some self-encrypting disks (SEDs) are capable of an operation that restores them as much as possible to their as-manufactured state. The `storage encryption disk revert-to-original-state` command invokes this special operation that is available only in SEDs that have the physical secure ID (PSID) printed on their labels.

The PSID is unique to each SED, meaning the command can revert only one SED at a time. The disk must be in a "broken" or "spare" state as shown by the output of the [“storage disk show” on page 874](#) command.

The operation in the SED accomplishes the following changes:

- Sanitizes all data by changing the disk encryption key to a new random value
- Sets the data authentication key (AK) and FTPS AK to the default values
- Resets the data locking controls
- Resets the power-on lock state to *false*
- Initializes other vendor-unique encryption-related parameters

The command releases the cluster shell after launching the operation. Monitor the output of the [“storage encryption disk show-status” on page 907](#) command for command completion.

When the operation is complete, it is possible to return the SED to service using the [“storage disk unfail” on page 889](#) command in *advanced* privilege mode. To do so, you might also need to reestablish ownership of the SED using the [“storage disk assign” on page 864](#) command.

Parameters

-disk <disk path name> - Disk Name

The name of the SED to be reverted to its as-manufactured state. See the man page for the storage disk modify command for information about disk-naming conventions.

-psid <text> - Physical Secure ID

The PSID printed on the SED label.

Examples

The following command shows a SED being returned to its as-manufactured state:

```
cluster1::> storage encryption disk revert-to-original-state -disk 01.10.0 -psid AC65PYF8CG45YZABUQJKM98WV2VZGRDL
```

storage encryption disk sanitize

Cryptographically sanitize a self-encrypting disk

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage encryption disk sanitize` command cryptographically sanitizes one or more self-encrypting disks (SEDs), making the existing data on the SED impossible to retrieve. This operation employs the inherent erase capability of SEDs to perform all of the following changes:

- Sanitizes all data by changing the disk encryption key to a new random value
- Sets the data authentication key (AK) to the default AK (manufacture secure ID/MSID or null, depending on the device type)
- Unlocks the data band
- Resets the power-on lock state to *false*

There is no method to restore the disk encryption key to its previous value, meaning that you cannot recover the data on the SED. Use this command with extreme care.

The sanitize command requires you to enter a confirmation phrase before proceeding with the operation.

The command releases the cluster shell after launching the operation. Monitor the output of the [“storage encryption disk show-status” on page 907](#) command for command completion.

When the operation is complete, it is possible to return the SED to service using the [“storage disk unfail” on page 889](#) command in *advanced* privilege mode. To do so, you might also need to reestablish ownership of the SED using the [“storage disk assign” on page 864](#) command.

Parameters

-disk <disk path name> - Disk Name

This parameter specifies the name of the SEDs you want to cryptographically sanitize. See the man page for the `storage disk modify` command for information about disk-naming conventions.

[-force-all-states [true]] - Sanitize All Matching Disks

When this parameter is *false* or not specified, the operation defaults to spare and broken disks only, as reported in the output of the [“storage disk show” on page 874](#) command. When you specify this parameter as *true*, it allows you to cryptographically sanitize all matching disk names regardless of their state, including those in active use in aggregates. This allows a quick erasure of all system data if you use the `-disk` parameter with the asterisk wildcard (*). If you sanitize active disks, the nodes might not be able to continue operation, and might halt or panic.

Examples

The following command sanitizes the disk 1.10.20:

```
cluster1::> storage encryption disk sanitize 1.10.20

Warning: This operation will cryptographically sanitize 1 spare or broken
self-encrypting disk on 1 node.
To continue, enter
  sanitize disk
:sanitize disk

Info: Starting sanitize on 1 disk.
View the status of the operation using the
“storage encryption disk show-status” on page 907 command.

cluster1::>
```

If you do not enter the correct confirmation phrase, the operation is aborted:

```
cluster1::> storage encryption disk sanitize 1.10.2*

Warning: This operation will cryptographically sanitize 5 spare or broken
```

```

        self-encrypting disks on 1 node.
        To continue, enter
        sanitize disk
        :yes
No disks sanitized.

cluster1::>

```

The following command quickly cryptographically sanitizes all system disks:

```

cluster1::> storage encryption disk sanitize -force-all-states -disk *

Warning: This operation will cryptographically sanitize 96
        self-encrypting disks on 4 nodes.
        To continue, enter
        sanitize disk
        :sanitize disk

Info: Starting sanitize on 96 disks.
      View the status of the operation by using the
      "storage encryption disk show-status" on page 907 command.

cluster1::>

```

storage encryption disk show

Display self-encrypting disk attributes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage encryption disk show` command displays information about self-encrypting disks (SEDs). By default, the command displays the following information about all SEDs:

- Disk name
- The protection mode of the SED
- The key ID associated with the data authentication key (data AK)

You can use the following parameters together with the `-disk` parameter to narrow the selection of displayed SEDs or the information displayed about them.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-fips]

If you specify this parameter, the command displays the key ID associated with the FIPS-compliance authentication key ("FIPS AK") instead of the data key ID.

| [-instance]

If you specify this parameter, the command displays detailed disk information about all disks, or only those specified by a `-disk` parameter.

[-disk <disk path name>] - Disk Name

If you specify this parameter, the command displays information about the specified disks. If you specify a single disk path name, the output is the same as when you use the `-instance` parameter. See the man page for the `storage disk modify` command for information about disk-naming conventions. Default is all self-encrypting disks.

[-container-name <text>] - Container Name

This parameter specifies the container name associated with a SED. If you specify an aggregate name or other container name, only the SEDs in that container are displayed. See the man page for the [“storage disk show” on page 874](#) command for a description of the container name. Use the [“storage aggregate show-status” on page 798](#) and [“storage disk show” on page 874](#) commands to determine which aggregates the SEDs are in.

[-container-type {aggregate | broken | foreign | labelmaint | maintenance | mediator | remote | shared | spare | unassigned | unknown | unsupported}] - Container Type

This parameter specifies the container type associated with a SED. If you specify a container type, only the SEDs with that container type are displayed. See the man page for the [“storage disk show” on page 874](#) command for a description of the container type.

[-data-key-id <text>] - Key ID of the Current Data Authentication Key

This parameter specifies the key ID associated with the data AK that the SED requires for authentication with the data-protection authorities in the SED. The special key ID `0x0` indicates that the current data AK of the SED is the default manufacture secure ID (MSID) that is not secret. Some devices employ a default AK that is null; you cannot specify a null data-key-id value. To properly protect data at rest on the device, modify the data AK using a key ID that is not the MSID. When you modify the data AK with a non-MSID key ID, the system automatically sets the device's power-on lock enable control so that authentication with the data AK is required after a device power-cycle. Use [“storage encryption disk modify” on page 901](#) -data-key-id key-id to protect the data. Use [“storage encryption disk modify” on page 901](#) -fips-key-id key-id to place the SED into FIPS-compliance mode.

[-fips-key-id <text>] - Key ID of the Current FIPS Authentication Key

This parameter specifies the key ID associated with the FIPS authentication key ("FIPS AK") that the system must use to authenticate with FIPS-compliance authorities in the SED.

[-is-power-on-lock-enabled {true|false}] - Is Power-On Lock Protection Enabled?

This parameter specifies the state of the SED control that determines whether the SED requires authentication with the data AK after a power-cycle. The system enables this control parameter automatically when you use the [“storage encryption disk modify” on page 901](#) -data-key-id command to set the data AK to a value other than the MSID. Data is protected only when this parameter is *true* and the data AK is not the MSID. Compare with the values of the -protection-mode parameter below.

[-protection-mode <text>] - Mode of SED Data and FIPS-Compliance Protection

The protection mode that the SED is in:

- open - data is unprotected; SED is not in FIPS-compliance mode
- data - data is protected; SED is not in FIPS-compliance mode
- part - data is unprotected; SED is in FIPS-compliance mode
- full - data is protected; SED is in FIPS-compliance mode

Examples

The following command displays information about all SEDs:

```
cluster1::> storage encryption disk show
Disk      Mode Data Key ID
-----
0.0.0    open 0x0
0.0.1    part 0x0
0.0.2    data 0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
1.10.0   open 0A53ED2A000000000100000000000000BDC1B27AD3F0DB8891375AED2F34D0B
1.10.1   part 0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
1.10.2   full 0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
[...]
```

Note in the example that only disk 1.10.2 is fully protected with FIPS mode, power-on-lock enable, and an AK that is not the default MSID.

The following command displays information about the protection mode and FIPS key ID for all SEDs:

```
cluster1::> storage encryption disk show -fips
Disk      Mode FIPS-Compliance Key ID
-----
0.0.0     open 0x0
0.0.1     part 0A53ED2A000000000100000000000000C1B27AD3F0DB8891375AED2F34D0BBED
0.0.2     data 0x0
1.10.0     open 0A53ED2A000000000100000000000000BEDC1B27AD3F0DB8891375AED2F34D0B
1.10.1     part 0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
1.10.2     full 0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
[...]
```

Note again that only disk 1.10.2 is fully protected with FIPS-compliance mode set, power-on-lock enabled, and a data AK that is not the default MSID.

The following command displays the individual fields for disk 1.10.1:

```
cluster1::> storage encryption disk show -disk 1.10.1

Disk Name: 1.10.1
Key ID of the Current Data Authentication Key: 0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
Key ID of the Current FIPS Authentication Key: 0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
Is Power-On Lock Protection Enabled?: true
Mode of SED Data and FIPS-Compliance Protection: open
```

storage encryption disk show-status

Display status of disk encryption operation

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage encryption disk show-status` command displays the results of the latest `destroy`, `modify`, or `sanitize` operation of the “[storage encryption disk](#)” on [page 900](#) command family. Use this command to view the progress of these operations on self-encrypting disks (SEDs).

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node Name

If you specify this parameter, the command displays disk encryption status for the nodes that match this parameter.

[-is-sed-support {true|false}] - Node Supports Self-Encrypting Disks

If you specify this parameter, the command displays disk encryption status for the nodes that match this parameter (*true* means the node supports SEDs).

[-latest-op <Storage Disk Encryption Operation>] - Latest Operation Requested

If you specify this parameter, the command displays disk encryption status for the nodes with a most recent “[storage encryption disk](#)” on [page 900](#) operation that matches this parameter (one of `destroy`, `modify`, `revert-to-original-state`, `sanitize`, or `unknown`).

[-op-start-time <MM/DD/YYYY HH:MM:SS>] - Operation Start Time

Selects the nodes with operation start times that match this parameter.

[-op-execute-time <integer>] - Execution Time in Seconds

If you specify this parameter, the command displays disk encryption status for the nodes with operation execution time that matches this parameter. The operation may be partial or completed.

[-disk-start-count <integer>] - Number of Disks Started

If you specify this parameter, the command displays disk encryption status for the nodes that started this number of SEDs in their latest operation.

[-disk-done-count <integer>] - Number of Disks Done

Selects the nodes that report this number of SEDs having completed the latest operation, successfully or not.

[-disk-success-count <integer>] - Number of Disks Successful

If you specify this parameter, the command displays disk encryption status for the nodes that report this number of SEDs that successfully completed the latest operation. When the operation is finished, if the success count is not the same as the started count, some additional detail is available using the `-instance` or `-node` parameters.

[-disk-no-key-id-count <integer>] - Number of Disks with Key ID Not Found

If you specify this parameter, the command displays disk encryption status for the nodes that report this number of SEDs that failed the latest operation because Data ONTAP could not find the Key IDs associated with the required authentication key of the SED.

[-disk-no-authent-count <integer>] - Number of Disks Not Authenticated

If you specify this parameter, the command displays disk encryption status for the nodes that report this number of SEDs that failed the latest operation because the identified Authentication Key could not authenticate with the SED.

Examples

When no operation has been requested since node boot, the status for that node is empty. If you enter a node name, the output is in the same format as for the `-instance` parameter.

```
cluster1::> storage encryption disk show-status -node node
```

```

Node Name: node
Node Supports Self-Encrypting Disks: true
Latest Operation Requested: unknown
Operation Start Time: -
Execution Time in Seconds: -
Number of Disks Started: -
Number of Disks Done: -
Number of Disks Successful: -
Number of Disks with Key ID Not Found: -
Number of Disks Not Authenticated: -
```

Once an operation begins, the status is dynamic until all devices have completed. When disks are modified, sanitized, or destroyed, sequential executions of `storage encryption disk show-status` appear as in this example that shows the progress of a modify operation on three SEDs on each node of a two-node cluster:

```
cluster1::> storage encryption disk show-status
```

Node	SED Support	Latest Request	Start Timestamp	Execution Time (sec)	Disks Begun	Disks Done	Disk Successful
node	true	modify	9/22/2014 13:58:53	4	3	0	0
node1	true	modify	9/22/2014 13:58:53	4	3	0	0

```
cluster1::> storage encryption disk show-status
```

Node	SED Support	Latest Request	Start Timestamp	Execution Time (sec)	Disks Begun	Disks Done	Disk Successful
node	true	modify	9/22/2014 13:58:53	7	3	3	3
node1	true	modify	9/22/2014 13:58:53	7	3	3	3

storage errors commands

The errors directory

storage errors show

Display storage configuration errors.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage errors show` command displays configuration errors with back end storage arrays.

Parameters

[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-uid <text>] - UID

Selects the disks that match this parameter value.

[-array-name <array name>] - Array Name

Selects the disks that have the specified name for the storage array that is connected to the cluster.

[-node {<nodename>|local}] - Controller Name

Selects the disks that match this parameter value.

[-disk <disk path name>] - Disk

Selects the disks that match this parameter value.

[-serial-number <text>] - Serial Number

Selects the disks that match this parameter value.

[-error-id <integer>, ...] - Error ID

Selects the disks with error-id values that match this parameter value.

[-error-type {onepath|onedomain|control|foreign|toobig|toosmall|invalidblocksize|targetasymmap|deviceassymmap|failovermisconfig|unknown|netapp|fwdownrev|qualfail|diskfail|notallflashdisk}, ...] - Error Type

Selects the disks with error types values that match this parameter value.

Examples

The following example displays configuration errors seen in the system:

```
cluster1::> storage errors show
Disk: vnv3070f20b:vnci9124s54:1-24.126L23
```

```
-----
vnci9124s54:1-24.126L23 (600a0b800019e999000036b24bac3983): This array LUN reports an invalid block size and is not usable. Only a block size
```

storage failover commands

Manage storage failover

This contains commands to display and modify storage failover related options of a node.

storage failover giveback

Return failed-over storage to its home node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage failover giveback` command returns storage that has failed over to a node's partner back to the home node. This operation fails if other resource-intensive operations (for instance, system dumps) are running and make the giveback operation potentially dangerous or disruptive. Some options are available only at the advanced privilege level and higher. Run the [“storage failover show-giveback” on page 927](#) command to check the status of giveback operations.

Notes:

- If the system ID of the partner has changed while the node is in takeover mode, the `storage failover giveback` command updates the ownership of the partner's disks to the new system ID while giving back.
- If the giveback operation fails due to the operation being vetoed by a subsystem, check the syslog or EMS output for a subsystem-specific reason for the abort. The corrective action is subsystem-specific and is detailed in the corrective action portion of the message. Follow the corrective action specified by the subsystem and then reissue the `storage failover giveback` command. If you cannot perform the corrective action, then use the `override-vetoes` option in the `storage failover giveback` command to force the giveback.
- If the giveback operation fails because the node cannot communicate with its partner, check the EMS output for the corrective action. Follow the corrective action and then reissue the `storage failover giveback` command. If you cannot perform the corrective action, then use the `-require-partner-waiting false` option in the `storage failover giveback` command to force the giveback. This parameter is available only at the advanced privilege level and higher.
- If the node does not receive notification that the partner has brought online the given-back aggregate and its volumes, the [“storage failover show-giveback” on page 927](#) command displays the giveback status for the aggregate as failed. A possible reason for this failure is that the partner is overloaded and slow in bringing the aggregate online. Run the [“storage aggregate show” on page 771](#) command to verify that the aggregate and its volumes are online on the partner node. The node will not attempt the giveback operation for remaining aggregates. To force the giveback, use the `-require-partner-waiting false` option in the `storage failover giveback` command. This parameter is available only at the advanced privilege level and higher.

Parameters

{ -ofnode {<nodename>|local} - Node to which Control is Givenback

Specifies the node whose storage is currently taken over by its partner and will be given back by the giveback operation.

| -fromnode {<nodename>|local} - Node Initiating Giveback

Specifies the node that currently holds the storage that is to be returned to the partner node.

[-require-partner-waiting {true|false}] - Require Partner in Waiting (privilege: advanced)

If this optional parameter is used and set to false, the storage is given back regardless of whether the partner node is available to take back the storage or not. If this parameter is used and set to true, the storage will not be given back if the partner node is not available to take back the storage. If this parameter is not used, the behavior defaults to the setting of the `-check-partner` option set with the [“storage failover modify” on page 911](#) command.

[-override-vetoes [true]] - Override All Vetoes

If this optional parameter is used, the system overrides veto votes during a giveback operation. If this parameter is not used, the system does not proceed with a giveback if it is vetoed. This parameter, if used, can only be set to true.

[-only-cfo-aggregates [true]] - Giveback Only CFO Aggregates

If this optional parameter is used, giveback of only the CFO aggregates (root aggregate and CFO style data aggregates) will be attempted. If this parameter is not used, giveback of all the aggregates (CFO and SFO aggregates) will be attempted. This parameter, if used, can only be set to true.

Examples

The following example gives back storage that is currently held by a node named node1. The partner must be available for the giveback operation to occur.

```
node::> storage failover giveback -fromnode node1
```

The following example gives back only the CFO aggregates to a node named node2 (the aggregates are currently held by a node named node1). The partner must be available for the giveback operation to occur, and the veto-giveback process can be overridden.

```
node::> storage failover giveback -ofnode node2  
-override-vetoes true -only-cfo-aggregates true
```

storage failover modify

Modify storage failover attributes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage failover modify` command changes the storage-failover options for a node. Some options are available only at the advanced privilege level and higher.

Parameters

-node {<nodename>|local} - Node

This specifies the node whose storage-failover options are to be modified.

{ [-enabled {true|false}] - Takeover Enabled

This optionally specifies whether storage failover is enabled. The default setting is `true`.

| [-mode {ha|non_ha}] - HA Mode

This specifies whether the node is set up in high-availability mode or stand-alone mode. If the node is a member of a high-availability configuration, set the value to `ha`. If the node is stand-alone, set the value to `non_ha`. Before setting the HA mode, you must complete the platform dependent steps to set up the system in a stand-alone or HA configuration as shown in the documentation for your platform.

[-auto-giveback {true|false}] - Auto Giveback Enabled

This optionally specifies whether automatic giveback operations are enabled. An automatic giveback operation is invoked when one node of a failover pair is in takeover mode and the failed node is repaired and restarts. When the repaired node boots, the node in takeover mode detects this and initiates a giveback operation. The default setting is `false`, except for two-node clusters where the default setting is `true`.

[-detection-time <integer>] - Takeover Detection Time (secs)

This optionally specifies the amount of time, in seconds, that a node remains unresponsive before its partner initiates a takeover operation. Possible values range from 10 to 180 seconds. The default setting is 15 seconds.

[-onfailure {true|false}] - Takeover on Failure Enabled (privilege: advanced)

This optionally specifies whether the node automatically takes over for its partner node if the partner node fails. The default setting is `true`. This parameter is available only at the advanced privilege level and higher.

[-onpanic {true|false}] - Takeover on Panic Enabled

This optionally specifies whether the node automatically takes over for its partner node if the partner node panics. The default setting is `true`. Changing this parameter on one node automatically makes the same change on its partner node.

[-onshort-uptime {true|false}] - Takeover on Short Uptime Enabled (privilege: advanced)

This optionally specifies whether the node takes over for its partner node if the partner node fails within 60 seconds of starting up; the time period is modifiable by using the `-short-uptime` parameter. The default setting is `true`. This parameter is available only at the advanced privilege level and higher.

`[-short-uptime <integer>]` - Short Uptime (secs) (privilege: advanced)

This optionally specifies the time period used by the `-onshort-uptime` parameter. The default setting is 60 seconds. This parameter is available only at the advanced privilege level and higher.

`[-attempts <integer>]` - Number of Giveback Attempts (privilege: advanced)

This optionally specifies the number of times the node attempts an automatic giveback operation within 60 minutes; the time period is modifiable by using the `-attempts-time` parameter. The default setting is 2 attempts. This parameter is available only at the advanced privilege level and higher.

`[-attempts-time <integer>]` - Giveback Attempts Period (minutes) (privilege: advanced)

This optionally specifies the time period used by the `-attempts` parameter. The default setting is 60 minutes. This parameter is available only at the advanced privilege level and higher.

`[-propagate {true|false}]` - Propagate Status via Mailbox (privilege: advanced)

This optionally specifies whether storage-failover status is communicated via mailbox disks. The default setting is `true`. This parameter is available only at the advanced privilege level and higher.

`[-read-interval <integer>]` - Node Status Read Interval (secs) (privilege: advanced)

This optionally specifies, in seconds, how frequently the node reads its partner node's status from the mailbox disks. The default setting is 5 seconds. This parameter is available only at the advanced privilege level and higher.

`[-write-interval <integer>]` - Node Status Write Interval (secs) (privilege: advanced)

This optionally specifies, in seconds, how frequently the node writes its status to the mailbox disks. The default setting is 5 seconds. This parameter is available only at the advanced privilege level and higher.

`[-onreboot {true|false}]` - Takeover on Reboot Enabled

This optionally specifies whether the node automatically takes over for its partner if the partner reboots. The default setting is `true`. Takeover can occur if the partner exceeds the expected time to reboot even when this option is set to `false`. The expected time to reboot is different for different platforms. The minimum expected time to reboot is 180 seconds. The `-inhibit-takeover` option of the [“system node reboot” on page 1149](#) command overrides this option: if a node is rebooted with `-inhibit-takeover` set to `true` then takeover does not occur, even if the takeover on reboot option is `true`. If a node does takeover due to the partner rebooting, then it will automatically giveback after the reboot, even if the `-auto-giveback` option is set to `false`. This is non-persistent behavior: if the node does takeover due to partner reboot and then itself reboots (prior to giveback) then it will not automatically giveback if the `-auto-giveback` option is set to `false`.

`[-delay-seconds <integer>]` - Delay Before Auto Giveback (secs)

This optionally specifies the minimum time that a node will stay in takeover state prior to performing an automatic giveback. If the taken over node recovers quickly (for example, if the takeover was due to a reboot), by delaying the giveback for a few minutes the outage during the takeover and giveback can be reduced to two short outages instead of one longer one. The allowed range is 0 to 600, inclusive. The default setting is 600 seconds. This option affects all types of auto-giveback. This parameter is available only at the advanced privilege level and higher.

Note: This delay does not affect manual giveback.

`[-hwassist {true|false}]` - Hardware Assist Enabled

This optionally specifies whether the hardware assist feature is enabled. If set to `true` this feature helps in fast takeover detection times in certain cases.

`[-hwassist-partner-ip <IP Address>]` - Partner's Hwassist IP

This optionally specifies the IP address on which the partner node receives hardware assist alerts. For the hardware assist feature to be active, the value of this option should be equal to partner's node management IP address.

`[-hwassist-partner-port <integer>]` - Partner's Hwassist Port

This optionally specifies the port number on which partner node listens to hardware assist alerts. It is recommended to have this value to be between 4000-4500. The default value is 4444.

[-hwassist-health-check-interval <integer>] - Hwassist Health Check Interval (secs)

This optionally specifies, in seconds, how frequently the hardware assist hardware on a node sends a heartbeat to its partner. The default value is 180.

[-hwassist-retry-count <integer>] - Hwassist Retry Count

This optionally specifies the number of times we repeat sending an hardware assist alert. The default value is 2.

[-auto-giveback-after-panic {true|false}] - Auto Giveback After Takeover On Panic

This optionally specifies whether a node should attempt automatic giveback operations if takeover was because of a disruption in the partner's operation. An automatic giveback operation is invoked when one node of a failover pair is in takeover mode and the failed node is repaired and restarts. When the repaired node boots, the node in takeover mode detects this and initiates a giveback operation automatically. The default setting is `true`.

[-aggregate-migration-timeout <integer>] - Aggregate Migration Timeout (secs) (privilege: advanced)

This optionally specifies the amount of time, in seconds, the source node has to wait for the destination node to complete the aggregate migration before declaring the migration as failed. The default setting is 120 seconds.

Examples

The following example enables the storage-failover service on a node named `node0`:

```
node::> storage failover modify -node node0 -enabled true
```

The following examples enable storage-failover takeover on a short uptime of 30 seconds on a node named `node0`:

```
node::*> storage failover modify -node node0 -onshort-uptime true -short-uptime 30
```

storage failover show

Display storage failover status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage failover show` command displays information about storage-failover configurations. By default, the command displays the following information:

- Node name.
- Partner node name.
- Whether storage failover is possible.
- The current state of storage failover. If the takeover is disabled the appropriate reason would be displayed.

To display detailed information about storage failover on a specific node, run the command with the `-node` parameter. The detailed view adds the following information:

- Node NVRAM ID.
- Partner NVRAM ID.
- Whether storage failover is enabled.
- Whether the storage-failover interconnect is available.
- Status of individual storage-failover interconnect links.
- Type and vendor of the storage-failover interconnect.

- Partner State
- Status codes from the takeover-by-partner process. Possible values include:
 - NVRAM_DOWN
 - OPERATOR_DISABLE_NVRAM
 - PARTNER_RESET
 - FM_TAKEOVER
 - NVRAM_MISMATCH
 - OPERATOR_DENY
 - CLUSTER_DISABLE
 - VERSION
 - SHELF_HOT
 - REVERT_IN_PROGRESS
 - HALT_NOTKOVER
 - TAKEOVER_ON_PANIC
- Reasons why takeover is not possible, if applicable. Possible values include:
 - NOT_INIT
 - DISABLED
 - DEGRADED
 - MBX_UNKNOWN
 - FM_VERSION
 - PARTNER_DISABLED
 - OPERATOR_DENY
 - NVRAM_MISMATCH
 - VERSION
 - IC_ERROR
 - BOOTING
 - SHELF_HOT
 - PARTNER_REVERT_IN_PROGRESS
 - LOCAL_REVERT_IN_PROGRESS
 - PARTNER_TAKEOVER
 - LOCAL_TAKEOVER
 - HALT_NOTKOVER
 - LOG_UNSYNC
 - UNKNOWN
 - WAITING_FOR_PARTNER
 - LOW_MEMORY
 - HALTING
 - MBX_UNCERTAIN
 - NO_AUTO_TKOVER
- Time until takeover, in seconds.

- Time until auto giveback, in seconds.
- Delay for auto giveback, in seconds.
- List of local mailbox disks.
- List of partner mailbox disks.
- Whether operator-initiated planned takeover will be optimized for performance by relocating SFO (non-root) aggregates serially to the partner prior to takeover.

You can specify additional parameters to select the displayed information. For example, to display information only about storage-failover configurations whose interconnect is down, run the command with `-interconnect-up false`.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-options]

Displays the following information:

- Node name
- Whether automatic giveback operations are enabled
- Whether long-running operations are terminated when an automatic giveback operation is initiated
- Whether the node checks its partner's readiness before initiating a giveback operation
- The time, in seconds, that the node remains unresponsive before its partner initiates a takeover operation
- Whether the node automatically takes over for its partner if the partner fails
- Whether the node automatically takes over for its partner if the partner panics
- Whether the node automatically takes over for its partner if the partner reboots
- whether Hardware Assisted Takeover is enabled
- Ip address on which the partner node listens to the Hardware Assist alerts
- Port number on which the partner node listens to the Hardware Assist alerts
- Whether operator-initiated planned takeover will be optimized for performance by relocating SFO (non-root) aggregates serially to the partner prior to takeover

If this parameter is specified when the privilege level is set to advanced or higher, the command displays the information in the previous list and the following additional information:

- Whether the node takes over for its partner if its partner fails after a period of time, which is listed in the following field
- The number of seconds before the node takes over for its partner
- The number of times the node attempts an automatic giveback operation within a period of time
- The number of minutes in which the automatic giveback attempts can occur
- Whether storage-failover status is communicated via mailbox disks
- The interval at which the node reads its partner node's status from the mailbox disks
- The interval at which the node writes its status to the mailbox disks
- The interval at which Hardware assist h/w sends a heartbeat
- The number of times the Hardware assist alert is sent

| [-takeover-status]

Displays the following information:

- Node name
- Partner name
- Takeover enabled
- Takeover possible
- Interconnect up
- State
- Node NVRAM ID
- Partner NVRAM ID
- Reason Takeover Not Possible By Partner
- Reason Takeover Not Possible
- Time Until Takeover

| **[-advanced] (privilege: advanced)**

Displays the following information:

- Node name
- Whether kill messages are issued during a takeover operation
- Whether the node controls its partner's storage aggregates
- The time when firmware notification was received
- The time when booting notification was received
- The time at which the last takeover or giveback operation occurred, in microseconds
- The number of times the failover log was unsynchronized

| **[-iotime] (privilege: advanced)**

Displays the following information:

- Node name
- Primary normal I/O time
- Primary transition I/O time
- Backup normal I/O time
- Backup transition I/O time

| **[-mailbox-status] (privilege: advanced)**

Displays the following information:

- Node name
- Primary mailbox status
- Backup mailbox status

| **[-more-options] (privilege: advanced)**

Displays the following information:

- Node name
- Whether takeover on short uptime is enabled
- Short uptime, in seconds
- Number of giveback attempts
- Interval of giveback attempts, in minutes
- Whether the primary mailbox is online

- Mailbox status read interval, in seconds
- Mailbox status write interval, in seconds

| [-progress] (privilege: advanced)

Displays the following information:

- Node name
- Maximum resource-table index number
- Current resource-table index number
- Current resource-table entry

| [-timeout] (privilege: advanced)

Displays the following information:

- Node name
- Fast timeout
- Slow timeout
- Mailbox timeout
- Connection timeout
- Operator timeout
- Firmware timeout
- Dump-core timeout
- Booting timeout
- Reboot timeout

| [-transit] (privilege: advanced)

Displays the following information:

- Node name
- Transit Timer Enabled
- Transit Timeout

| [-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the nodes whose name matches this parameter value.

[-partner-name <text>] - Partner Name

Selects the nodes that have the specified partner-name setting.

[-nvramid <integer>] - Node NVRAM ID

Selects the nodes that have the specified NVRAM ID setting.

[-partner-nvramid <integer>] - Partner NVRAM ID

Selects the nodes that have the specified partner NVRAM ID setting.

[-enabled {true|false}] - Takeover Enabled

Selects the nodes that have the specified takeover-enabled setting.

[-mode {ha|non_ha}] - HA Mode

Selects the nodes that have the specified HA-mode setting. If the value is set to `ha` then the node is a member of a storage-failover configuration. If it is set to `non-ha` then it is in a stand alone configuration.

[-possible {true|false}] - Takeover Possible

Selects the nodes that have the specified failover-possible setting.

[-reason <text>, ...] - Reason Takeover not Possible

Selects the nodes that have the specified reason-not-possible setting. Possible values include:

- NOT_INIT
- DISABLED
- DEGRADED
- MBX_UNKNOWN
- FM_VERSION
- PARTNER_DISABLED
- OPERATOR_DENY
- NVRAM_MISMATCH
- VERSION
- IC_ERROR
- BOOTING
- SHELF_HOT
- PARTNER_REVERT_IN_PROGRESS
- LOCAL_REVERT_IN_PROGRESS
- PARTNER_TAKEOVER
- LOCAL_TAKEOVER
- HALT_NOTKOVER
- LOG_UNSYNC
- UNKNOWN
- WAITING_FOR_PARTNER
- LOW_MEMORY
- HALTING
- MBX_UNCERTAIN
- NO_AUTO_TKOVER

[-interconnect-up {true|false}] - Interconnect Up

Selects the nodes that have the specified interconnect-up setting.

[-interconnect-links <text>] - Interconnect Links

Selects the nodes that have the specified interconnect-links setting.

[-interconnect-type <text>] - Interconnect Type

Selects the nodes that have the specified interconnect-type setting.

[-state-description <text>] - State Description

Selects the nodes that have the specified state-description setting.

[-partner-state <text>] - Partner State

Selects the nodes that have the specified partner-state setting. Possible values include:

- OPERATOR COMPLETED
- DEBUGGUER COMPLETED
- PROGRESS COUNTER
- I/O ERROR
- BAD CHECKSUM
- RESERVED

- UNKNOWN
- INITIALIZING
- IN POWER-ON SELF TEST
- BOOTING
- BOOT FAILED
- WAITING
- KERNEL LOADED
- UP
- IN DEBUGGER
- WAITING FOR OPERATOR INPUT
- DUMPING CORE
- HALTED
- REBOOTING
- WAITING FOR GIVEBACK (DISK RESERVATIONS)
- WAITING FOR GIVEBACK (HA MAILBOXES)
- DUMPING SPARECORE
- MULTI-DISK PANIC
- IN TAKEOVER

[-time-until-takeover <integer>] - Time Until Takeover

Selects the nodes that have the specified time-until-takeover setting.

[-partner-reason <text>, ...] - Reason Takeover not Possible by Partner

Selects the nodes that have the specified partner-reason text setting.

[-killpackets {true|false}] - Issue Kill Packets (privilege: advanced)

Selects the nodes that have the specified kill packets setting.

[-partner-aggregates {true|false}] - Control Partner Aggregates (privilege: advanced)

Selects the nodes that have the specified partner aggregates setting.

[-current-index <integer>] - Current Progress Index (privilege: advanced)

Selects the nodes that have the specified current-progress index setting.

[-current-entry <text>] - Current Progress Entry (privilege: advanced)

Selects the nodes that have the specified current-progress entry setting.

[-maximum-index <integer>] - Maximum Progress Index (privilege: advanced)

Selects the nodes that have the specified maximum-progress index setting.

[-pmbox-status <text>, ...] - Primary Mailbox Status (privilege: advanced)

Selects the nodes that have the specified primary mailbox status setting. Possible values include:

- MBX_STATUS_NODISKS
- MBX_STATUS_UNCERTAIN
- MBX_STATUS_STALE
- MBX_STATUS_CONFLICTED
- MBX_STATUS_OLD_VERSION
- MBX_STATUS_NOT_FOUND
- MBX_STATUS_WRONG_STATE
- MBX_STATUS_BACKUP

[-bmbox-status <text>, ...] - Backup Mailbox Status (privilege: advanced)

Selects the nodes that have the specified backup-mailbox status setting. See the description of the `-pmbox-status` parameter for a list of possible values.

[-major-seq-num-local <integer>] - Local Major Sequence Number (privilege: advanced)

Selects the nodes that have the specified mailbox heartbeat major sequence number on the local node.

[-minor-seq-num-local <integer>] - Local Minor Sequence Number (privilege: advanced)

Selects the nodes that have the specified mailbox heartbeat minor sequence number on the local node.

[-major-seq-num-partner <integer>] - Partner Major Sequence Number (privilege: advanced)

Selects the nodes that have the specified mailbox heartbeat major sequence number on the partner node.

[-minor-seq-num-partner <integer>] - Partner Minor Sequence Number (privilege: advanced)

Selects the nodes that have the specified mailbox heartbeat minor sequence number on the partner node.

[-local-mbx-node-status <Mailbox Status>] - Local Mailbox Node Status (privilege: advanced)

Selects the nodes that have the specified local mailbox node status. Possible values include:

- MBX_UNKNOWN - Local node is up, mailbox uninitialized
- MBX_TAKEOVER_DISABLED - Local node is up but takeover is disallowed
- MBX_TAKEOVER_ENABLED - Local node is up and takeover is allowed
- MBX_TAKEOVER_ACTIVE - Partner node has taken over
- MBX_GIVEBACK_DONE - Giveback completed, but local node has not yet restarted

[-mbx-abs-time-local <integer>] - Local Mailbox Absolute Time (privilege: advanced)

Selects the nodes that have the specified local mailbox channel absolute time. This time is measured in msec since 1/1/1970 (epoch).

[-mbx-sk-time-local <integer>] - Local Mailbox Kernel Time (privilege: advanced)

Selects the nodes that have the specified local mailbox channel Kernel Time.

[-mbx-sk-cycles-local <integer>] - Local Mailbox CPU Cycles (privilege: advanced)

Selects the nodes that have the specified local mailbox channel CPU Cycle count.

[-ic-abs-time-local <integer>] - Local IC Absolute Time (privilege: advanced)

Selects the nodes that have the specified local Interconnect channel absolute time. This time is measured in msec since 1/1/1970 (epoch).

[-ic-sk-time-local <integer>] - Local IC Kernel Time (privilege: advanced)

Selects the nodes that have the specified local Interconnect channel Kernel Time.

[-ic-sk-cycles-local <integer>] - Local IC CPU Cycles (privilege: advanced)

Selects the nodes that have the specified local Interconnect channel CPU Cycle count.

[-partner-mbx-node-status <Mailbox Status>] - Partner Mailbox Node Status (privilege: advanced)

Selects the nodes that have the specified partner mailbox node status. Possible values include:

- MBX_UNKNOWN
- MBX_TAKEOVER_DISABLED
- MBX_TAKEOVER_ENABLED
- MBX_TAKEOVER_ACTIVE
- MBX_GIVEBACK_DONE

[-mbx-abs-time-partner <integer>] - Partner Mailbox Absolute Time (privilege: advanced)

Selects the nodes that have the specified partner mailbox channel absolute time. This time is measured in msec since 1/1/1970 (epoch).

[-mbx-sk-time-partner <integer>] - Partner Mailbox Kernel Time (privilege: advanced)

Selects the nodes that have the specified partner mailbox channel Kernel Time.

[-mbx-sk-cycles-partner <integer>] - Partner Mailbox CPU Cycles (privilege: advanced)

Selects the nodes that have the specified partner mailbox channel CPU Cycle count.

[-mbx-major-seq-num-partner <integer>] - Partner Mailbox Major Sequence Number (privilege: advanced)

Selects the nodes that have the specified partner mailbox channel major sequence number.

[-mbx-minor-seq-num-partner <integer>] - Partner Mailbox Minor Sequence Number (privilege: advanced)

Selects the nodes that have the specified partner mailbox channel minor sequence number.

[-ic-abs-time-partner <integer>] - Partner IC Absolute Time (privilege: advanced)

Selects the nodes that have the specified partner Interconnect channel absolute time. This time is measured in msec since 1/1/1970 (epoch).

[-ic-sk-time-partner <integer>] - Partner IC Kernel Time (privilege: advanced)

Selects the nodes that have the specified partner Interconnect channel Kernel Time.

[-ic-sk-cycles-partner <integer>] - Partner IC CPU Cycles (privilege: advanced)

Selects the nodes that have the specified partner Interconnect channel CPU Cycle count.

[-ic-major-seq-num-partner <integer>] - Partner IC Major Sequence Number (privilege: advanced)

Selects the nodes that have the specified partner Interconnect channel major sequence number.

[-ic-minor-seq-num-partner <integer>] - Partner IC Minor Sequence Number (privilege: advanced)

Selects the nodes that have the specified partner Interconnect channel minor sequence number.

[-local-takeover-info <text>] - Local Takeover Info (privilege: advanced)

Selects the nodes that have the specified local node takeover information. This includes the type of negotiated failover request, or if takeover is not possible, the reason why takeover is disabled. Possible values include:

- NOTKOVER_NVRAM_DOWN - NVRAM mirror is down
- NOTKOVER_OPERATOR_DISABLE_NVRAM - Operator disabled
- NOTKOVER_PARTNER_RESET - A link reset is in progress
- NOTKOVER_FM_TAKEOVER - The failover monitor has declared takeover
- NOTKOVER_NVRAM_MISMATCH - NVRAM sizes mismatch
- NOTKOVER_OPERATOR_DENY - Operator denies takeover
- NOTKOVER_CLUSTER_DISABLE - Cluster is disabled
- NOTKOVER_VERSION - Version mismatch
- NOTKOVER_SHELF_HOT - Disk shelf is too hot
- NOTKOVER_REVERT_IN_PROGRESS - Revert is in progress
- NOTKOVER_HALT_NOTKOVER - Node halted in no-takeover mode
- TKOVER_ON_REBOOT - Enable takeover on reboot
- TKOVER_ON_PANIC - Enabled takeover on panic
- TKOVER_ON_STUTTER_DISABLED - Disable takeover on short uptime
- NFO_DISK_SHELF_ENABLED - Negotiated failover for disk shelf module is enabled
- NFO_ISCSI_ENABLED - Negotiated failover for network interfaces module is enabled
- NFO_FCP_TARGET_ENABLED - Negotiated failover for fcp target module is enabled

[-partner-takeover-info <text>] - Partner Takeover Info (privilege: advanced)

Selects the nodes that have the specified partner node takeover information. This includes the type of negotiated failover request, or if takeover is not possible, the reason why takeover is disabled. Possible values include:

- NOTKOVER_NVRAM_DOWN - NVRAM mirror is down
- NOTKOVER_OPERATOR_DISABLE_NVRAM - Operator disabled
- NOTKOVER_PARTNER_RESET - A link reset is in progress
- NOTKOVER_FM_TAKEOVER - The failover monitor has declared takeover
- NOTKOVER_NVRAM_MISMATCH - NVRAM sizes mismatch
- NOTKOVER_OPERATOR_DENY - Operator denies takeover
- NOTKOVER_CLUSTER_DISABLE - Cluster is disabled
- NOTKOVER_VERSION - Version mismatch
- NOTKOVER_SHELF_HOT - Disk shelf is too hot
- NOTKOVER_REVERT_IN_PROGRESS - Revert is in progress
- NOTKOVER_HALT_NOTKOVER - Node halted in no-takeover mode
- TKOVER_ON_REBOOT - Takeover on reboot is enabled
- TKOVER_ON_PANIC - Takeover on panic is enabled
- TKOVER_ON_STUTTER_DISABLED - Disable takeover on short uptime
- NFO_DISK_SHELF_ENABLED - Negotiated failover for disk shelf module is enabled
- NFO_ISCSI_ENABLED - Negotiated failover for network interfaces module is enabled
- NFO_FCP_TARGET_ENABLED - Negotiated failover for fcp target module is enabled

[-local-headswap-state <Headswap State>] - Local Head Swap State (privilege: advanced)

Selects the nodes that have the specified local node headswap state. Possible values are:

- HEADSWAP_NONE - head swap not in progress
- HEADSWAP_START - head swap started
- HEADSWAP_CFO_START - CFO phase of head swap started
- HEADSWAP_CFO_END - CFO phase of head swap completed
- HEADSWAP_SFO_START - SFO phase of head swap started

[-partner-headswap-state <Headswap State>] - Partner Head Swap State (privilege: advanced)

Selects the nodes that have the specified partner node headswap state. Possible values are:

- HEADSWAP_NONE - head swap not in progress
- HEADSWAP_START - head swap started
- HEADSWAP_CFO_START - CFO phase of head swap started
- HEADSWAP_CFO_END - CFO phase of head swap completed
- HEADSWAP_SFO_START - SFO phase of head swap started

[-fast-timeout <integer>] - Fast Timeout (privilege: advanced)

Selects the nodes that have the specified fast-timeout configuration setting.

[-slow-timeout <integer>] - Slow Timeout (privilege: advanced)

Selects the nodes that have the specified slow-timeout setting.

[-mailbox-timeout <integer>] - Mailbox Timeout (privilege: advanced)

Selects the nodes that have the specified mailbox-timeout setting.

[-connect-timeout <integer>] - Connect Timeout (privilege: advanced)

Selects the nodes that have the specified connect-timeout setting.

- [-operator-timeout <integer>] - Operator Timeout (privilege: advanced)**
Selects the nodes that have the specified operator-timeout setting.
- [-firmware-timeout <integer>] - Firmware Timeout (privilege: advanced)**
Selects the nodes that have the specified firmware-timeout setting.
- [-dumpcore-timeout <integer>] - Dumpcore Timeout (privilege: advanced)**
Selects the nodes that have the specified dump-core timeout setting.
- [-booting-timeout <integer>] - Booting Timeout (privilege: advanced)**
Selects the nodes that have the specified booting-timeout setting.
- [-transit-timer {true|false}] - Transit Timer Enabled (privilege: advanced)**
Selects the nodes that have the specified transit-timer setting.
- [-transit-timeout <integer>] - Transit Timeout (privilege: advanced)**
Selects the nodes that have the specified transit timeout.
- [-firmware-received <integer>] - Firmware Received (privilege: advanced)**
Selects the nodes that have the specified firmware-reception time.
- [-firmware-received-cycles <integer>] - Firmware Received in CPU Cycles (privilege: advanced)**
Selects the nodes that have the specified firmware-reception time in CPU Cycles.
- [-booting-received <integer>] - Booting Received (privilege: advanced)**
Selects the nodes that have the specified booting-reception time.
- [-transit-time <integer>] - Transit Event Time (privilege: advanced)**
Selects the nodes whose last failover event occurred at the specified time.
- [-pnormal <integer>] - Primary Normal IO Time (privilege: advanced)**
Selects the nodes that have the specified normal primary-mailbox I/O time.
- [-ptransition <integer>] - Primary Transition IO Time (privilege: advanced)**
Selects the nodes that have the specified transitional primary-mailbox I/O time.
- [-bnormal <integer>] - Backup Normal IO Time (privilege: advanced)**
Selects the nodes that have the specified normal backup-mailbox I/O time.
- [-btransition <integer>] - Backup Transition IO Time (privilege: advanced)**
Selects the nodes that have the specified transitional backup-mailbox I/O time.
- [-logs-unsynced <integer>] - Logs Unsynced Count (privilege: advanced)**
Selects the nodes that have the specified count of unsynchronized logs.
- [-auto-giveback {true|false}] - Auto Giveback Enabled**
Selects the nodes that have the specified auto-giveback setting.
- [-detection-time <integer>] - Takeover Detection Time (secs)**
Selects the nodes that have the specified detection-time setting.
- [-onfailure {true|false}] - Takeover on Failure Enabled (privilege: advanced)**
Selects the nodes that have the specified takeover-on-failure setting.
- [-onpanic {true|false}] - Takeover on Panic Enabled**
Selects the nodes that have the specified takeover-on-panic setting.
- [-onshort-uptime {true|false}] - Takeover on Short Uptime Enabled (privilege: advanced)**
Selects the storage-failover configurations that match this parameter value.
- [-short-uptime <integer>] - Short Uptime (secs) (privilege: advanced)**
Selects the nodes that have the specified short-uptime value.
- [-attempts <integer>] - Number of Giveback Attempts (privilege: advanced)**
Selects the nodes that have the specified number of giveback attempts.

- [-attempts-time <integer>] - Giveback Attempts Period (minutes) (privilege: advanced)**
Selects the nodes that have the specified time setting for giveback attempts.
- [-propagate {true|false}] - Propagate Status via Mailbox (privilege: advanced)**
Selects the nodes that have the specified propagate-status-via-mailbox setting.
- [-read-interval <integer>] - Node Status Read Interval (secs) (privilege: advanced)**
Selects the nodes that have the specified read interval.
- [-write-interval <integer>] - Node Status Write Interval (secs) (privilege: advanced)**
Selects the nodes that have the specified write interval.
- [-onreboot {true|false}] - Takeover on Reboot Enabled**
Selects the nodes that have the specified takeover-on-reboot setting.
- [-delay-seconds <integer>] - Delay Before Auto Giveback (secs)**
Selects the nodes that have the specified delay (in seconds) for the auto giveback.
- [-hwassist {true|false}] - Hardware Assist Enabled**
Selects the nodes that have the specified hwassist setting.
- [-hwassist-partner-ip <IP Address>] - Partner's Hwassist IP**
Selects the nodes that have the specified hwassist-partner-ip setting.
- [-hwassist-partner-port <integer>] - Partner's Hwassist Port**
Selects the nodes that have the specified hwassist-partner-port setting.
- [-hwassist-health-check-interval <integer>] - Hwassist Health Check Interval (secs)**
Selects the nodes that have the specified hwassist health check interval, in seconds.
- [-hwassist-retry-count <integer>] - Hwassist Retry Count**
Selects the nodes that have the specified hwassist retry count, in seconds.
- [-hwassist-status <text>] - Hwassist Status**
Selects the nodes that have the specified hwassist-status setting.
- [-time-until-autogiveback <integer>] - Time Until Auto Giveback (secs)**
Selects the nodes that have the specified time(in seconds) until auto giveback.
- [-local-mailbox-disks <text>] - Local Mailbox Disks**
Selects the nodes that have the specified mailbox disks on the local node.
- [-partner-mailbox-disks <text>] - Partner Mailbox Disks**
Selects the nodes that have the specified mailbox disks on the partner node.
- [-local-firmware-state <text>] - Local Firmware State (privilege: advanced)**
Selects the nodes that have the specified firmware state on the local node.
- [-local-firmware-progress <integer>] - Local Firmware Progress Counter (privilege: advanced)**
Selects the nodes that have the specified firmware progress counter for the local node.
- [-partner-firmware-state <text>] - Partner Firmware State (privilege: advanced)**
Selects the nodes that have the specified firmware state of the partner node.
- [-partner-firmware-progress <integer>] - Partner Firmware Progress Counter (privilege: advanced)**
Selects the nodes that have the specified firmware progress counter for the partner node.
- [-local-missing-disks <text>] - Missing Disks on Local Node**
Selects the nodes that have the specified missing disks on the local node.
- [-partner-missing-disks <text>] - Missing Disks on Partner Node**
Selects the nodes that have the specified missing disks on the partner node.
- [-reboot-timeout <integer>] - Reboot Timeout (privilege: advanced)**
Selects the nodes that have the specified reboot timeout.

[-time-since-takeover <text>] - Time Since Takeover

Selects the nodes that have been in takeover mode for the specified amount of time.

[-auto-giveback-after-panic {true|false}] - Auto Giveback After Takeover On Panic

Selects the nodes that have the specified auto-giveback-after-panic setting. If *true* then an automatic giveback operation is invoked when the failover node of an HA pair is repaired and rebooted. The takeover node of the HA pair detects this and initiates a giveback operation automatically.

[-is-giveback-requested {true|false}] - Giveback Requested (privilege: advanced)

Selects the nodes that have the specified is-giveback-requested setting. If *true*, a deferred giveback request has been made by the local node.

[-auto-giveback-last-veto-check <integer>] - Auto Giveback Last Veto Check (privilege: advanced)

Selects the nodes that have the specified auto-giveback-last-veto-check time. This setting indicates the time, in milliseconds, when the local node made the most recent giveback veto check.

[-is-auto-giveback-attempts-exceeded {true|false}] - Auto Giveback Attempts Exceeded (privilege: advanced)

Selects the nodes that have the specified is-auto-giveback-attempts-exceeded setting. If *true*, the local node has exceeded the maximum number of allowed auto giveback attempts.

[-was-auto-giveback-done {true|false}] - Was Auto Giveback Done (privilege: advanced)

Selects the nodes that have the specified was-auto-giveback-done setting. If *true*, the last giveback was automatic (as opposed to a manual giveback).

[-is-cifs-auto-giveback-stopping {true|false}] - Is CIFS Auto Giveback Stopping (privilege: advanced)

Selects the nodes that have the specified is-cifs-auto-giveback-stopping setting. If *true*, the local node has initiated CIFS termination as part of an automatic giveback.

[-aggregate-migration-timeout <integer>] - Aggregate Migration Timeout (secs) (privilege: advanced)

Selects the nodes that have the specified aggregate migration timeout.

[-is-mirror-enabled {true|false}] - Is NVRAM Mirroring Enabled (privilege: advanced)

Selects the nodes that have the specified is-mirror-enabled setting. If *true*, then NVRAM mirroring is enabled.

[-is-mirror-consistency-required {true|false}] - Is Mirror Consistency Required (privilege: advanced)

Selects the nodes that have the specified is-mirror-consistency-required setting. If *true*, then NVRAM mirror consistency is required.

[-is-memory-insufficient {true|false}] - Is Memory Insufficient To Takeover (privilege: advanced)

Selects the nodes that have the specified is-memory-insufficient setting. If *true*, the local node does not have enough memory to perform a takeover.

[-memio-state <memio status>] - Current State of Memio Link (privilege: advanced)

Selects the nodes that have the specified memio layer link current state. Possible values are:

- UNINIT - Uninitialized
- CLOSED - Closed
- HB_LISTEN - Listening for connect
- SYN_SENT - Sent generation information
- ESTABLISHED - Connection established

[-is-degraded {true|false}] - Are Partner Mailbox Disks Not Known (privilege: advanced)

Selects the nodes that have the specified is-degraded setting. If *true*, takeovers are deferred because partner mailbox disks are not known.

[-reserve-policy <reserve policy>] - FM Reservation Policy (privilege: advanced)

Selects the nodes that have the specified disk reservation policy. Possible values are:

- **RESERVE_NO_DISKS** - no disk reservations made during takeover, nor are disk reservations released during giveback
- **RESERVE_LOCK_DISKS_ONLY** - only mailbox disks are released during takeover and released during giveback
- **RESERVE_ONLY_AT_TAKEOVER** - reservations are issued only at takeover time. All disks are reserved. All reservations are released at giveback
- **RESERVE_ALWAYS_AFTER_TAKEOVER** - reservations are issued at takeover. When disks are subsequently added, they are also reserved. All disks are released at giveback

[-reset-disks {true|false}] - Issue Disk Resets during Failover (privilege: advanced)

Selects the nodes that have the specified reset-disks setting. If *true*, disks are reset during takeover/giveback.

[-total-system-uptime <integer>] - Total System Uptime (privilege: advanced)

Selects the nodes that have the specified total system uptime, in milliseconds.

[-current-time <integer>] - Current System Time (privilege: advanced)

Selects the nodes that have the specified current time on the node.

[-fm-takeover-state <FM Takeover/Giveback Transition>] - FM Takeover State (privilege: advanced)

Selects the nodes that have the specified takeover state. Possible values are:

- **FT_NONE** - Not in takeover
- **FT_TAKEOVER_STARTED** - Local node has initiated takeover
- **FT_TAKEOVER_COMMITTED** - Takeover has been committed
- **FT_TAKEOVER_DONE_OK** - Local node successfully completed takeover
- **FT_TAKEOVER_DONE_FAILED** - Takeover failed

[-fm-giveback-state <FM Takeover/Giveback Transition>] - FM Giveback State (privilege: advanced)

Selects the nodes that have the specified giveback state. Possible values are:

- **FT_NONE** - Not in giveback
- **FT_GIVEBACK_READY** - Partner node is ready for giveback
- **FT_GIVEBACK_STARTED** - Local node has initiated giveback
- **FT_GIVEBACK_COMMITTED** - Giveback has been committed
- **FT_GIVEBACK_DONE_OK** - Giveback completed successfully

[-takeover-reason <FM Takeover Reason>] - Reason why takeover triggered (privilege: advanced)

Selects the nodes that have the specified takeover reason. Possible values are:

- **TAKEOVER_NONE** - Not in takeover
- **TAKEOVER_IMMEDIATE** - Operator initiated forced takeover
- **TAKEOVER_NDU** - Takeover initiated as part of NDU
- **TAKEOVER_FORCED** - Operator initiated forced takeover, possible data loss
- **TAKEOVER_EARLY** - Takeover occurred during the boot process
- **TAKEOVER_OPERATOR_EXP** - Takeover occurred after the operator timeout expired
- **TAKEOVER_POST_FAILED** - Takeover occurred on POST failure
- **TAKEOVER_PANIC** - Takeover on panic
- **TAKEOVER_SHORTUPTIME** - Takeover after rapid toggling between up and down states
- **TAKEOVER_SPARECORE_EXP** - Takeover on panic timeout expiration
- **TAKEOVER_REBOOT_EXP** - Takeover on reboot timer expiration
- **TAKEOVER_BOOTING_EXP** - Takeover on booting timer expiration

- TAKEOVER_FIRMWARE_EXP - Takeover on firmware timer expiration
- TAKEOVER_NFO_SHUTDOWN - Takeover on negotiated failover shutdown
- TAKEOVER_NFO_TIMER - Takeover on negotiated failover timer expiration
- TAKEOVER_MDP - Takeover on multi-disk panic
- TAKEOVER_REBOOT - Takeover on reboot
- TAKEOVER_HALT - Takeover on halt
- TAKEOVER_CLAM - CLAM-triggered takeover
- TAKEOVER_HWASSIST - Hardware-assisted takeover
- TAKEOVER_NORMAL - Operator initiated takeover

`[-ha-type {none|shared_storage|non_shared_storage}] - HA Type`

If this parameter is specified, the command selects the nodes that have the specified HA-type setting. If the value is set to *shared_storage*, then the node is in a storage-failover configuration using the shared storage. If it is set to *non_shared_storage*, then the node is in a storage-failover configuration using the unshared storage. If it is set to *none*, then the node is not part of a storage-failover configuration.

Examples

The following example displays information about all storage-failover configurations:

```
cluster1::> storage failover show
Node      Partner  Takeover Possible State
-----
node0     node1    true    Connected to node1
node2     node3    true    Connected to node3
node1     node0    true    Connected to node0
node3     node2    true    Connected to node2
4 entries were displayed.
```

storage failover show-giveback

Display giveback status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage failover show-giveback` command displays information about the giveback status of high-availability (HA) partner aggregates. The command displays the following information when no parameters are specified:

- Node name
- Partner aggregate name
- Giveback Status

You can specify additional parameters to display only the information that matches those parameters. For example, to display information only about a particular aggregate, run the command with the `-aggregate aggregate_name` parameter.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance ]]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node`

If this parameter is used, the command displays information about the giveback status of the aggregates belonging to the HA partner of the specified node.

[-aggregate <text>] - Aggregate

If this parameter is used, the command displays information about the giveback status of the specified aggregate.

[-giveback-status <text>, ...] - Aggregates Giveback State

If this parameter is used, the command displays information about the aggregates with the specified giveback status.

[-destination <text>] - Destination for Giveback

If this parameter is used, the command displays information about the giveback status of the aggregates whose destination after the giveback is the specified node.

Examples

The following example displays information about giveback status on all nodes:

```
node::> storage failover show-giveback
```

Node	Partner Aggregate	Giveback Status
node0	-	No aggregates to give back
node1	-	No aggregates to give back
node2	-	No aggregates to give back
node3	-	No aggregates to give back

4 entries were displayed.

storage failover show-takeover

Display takeover status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage failover show-takeover` command displays information about the takeover status of nodes in a cluster. The command also displays the takeover status of aggregates being taken over. During each phase of takeover, the takeover node and the node being taken over display their takeover status and the status of the aggregates being taken over. The command displays the following information when no parameters are specified:

- Node name
- Node takeover status - This contains a descriptive information about the phase of takeover.
- Aggregate
- Aggregate takeover status - This contains the following information:
 - Takeover status of the aggregate, such as "Done", "Failed", "In progress" and "Not attempted yet".
 - Reason for an aggregate takeover failure.
 - Corrective action, in case of an aggregate takeover failure.

You can specify additional parameters to display only the information that matches those parameters. For example, to display information only about a particular node, run the command with the `-node node_name` parameter.

Parameters

{ [-fields <fieldname>, ...]

If this parameter is specified, the command displays the specified fields for all nodes, in column style output.

[`-instance`]]

If this parameter is specified, the command displays the same detailed information as for the `-node` parameter, but for all nodes.

[`-node {<nodename>|local}`]] - Node Name

If this parameter is specified, the command displays information about the takeover status of the specified node, and the takeover status of the aggregates being taken over.

[`-node-takeover-status <text>`]] - Node's Takeover Status

If this parameter is specified, the command displays information about the takeover status of the nodes with the specified node-takeover-status. The command also displays the takeover status of the aggregates belonging to the node being taken over.

[`-aggregate <text>`]] - Aggregate Being Taken Over

If this parameter is specified, the command displays information about the takeover status of the specified aggregate, and the takeover status of the nodes containing the specified aggregate.

[`-aggregate-takeover-status <text>`]] - Aggregate's Takeover Status

If this parameter is specified, the command displays information about the takeover status of the aggregates with the specified aggregate takeover status, and the takeover status of the nodes containing those aggregates.

Examples

The following example shows the takeover status of two nodes, nodeA and nodeB, in an High Availability (HA) pair, when both are in normal mode; neither node has taken over its HA partner. In this case, there is no takeover status for the aggregates.

```
cluster1::> storage failover show-takeover
Node      Node Status      Aggregate      Takeover Status
-----
nodeA     Takeover not
           attempted.
           -
nodeB     Takeover not
           attempted.
           -
```

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA is in the SFO phase of an optimized takeover of nodeB. In this case, nodeA does not have information about the takeover status of nodeB's aggregates.

```
cluster1::> storage failover show-takeover
Node      Node Status      Aggregate      Takeover Status
-----
nodeA     Optimized takeover
           of partner in
           progress. Partner,
           ("nodeB"), is
           relocating its SFO
           aggregates. Run the
           command "storage
           failover
           show-takeover -node
           nodeB" to display the
           relocation status of
           the partner.
           -
nodeB     Being taken over.
           aggr1      In progress, Module: backup.
           aggr2      Not attempted yet
           CFO aggregates Not attempted yet.
```

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA has completed the SFO phase of an optimized takeover of nodeB (but has not completed the CFO phase of the optimized takeover). In this case, nodeA has information about the takeover status of nodeB's aggregates.

```
cluster1::> storage failover show-takeover
Node      Node Status      Aggregate      Takeover Status
-----
nodeA      Partner has
            relocated its
            aggregates. Takeover
            in progress.
            aggr1      Done
            aggr2      Done
            CFO aggregates In progress.
nodeB      Relocated aggregates
            to partner. Waiting
            for partner to
            takeover.
            aggr1      Done
            aggr2      Done
            CFO aggregates Not attempted yet.
```

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA has completed the SFO and CFO phases of an optimized takeover of nodeB. In this case, nodeA has information about the takeover status of nodeB's aggregates. Since nodeB is not operational, an Remote Procedure Call(RPC) error is indicated in the command output.

```
cluster1::> storage failover show-takeover
Node      Node Status      Aggregate      Takeover Status
-----
nodeA      Partner has
            relocated its
            aggregates. In
            takeover.
            aggr1      Done
            aggr2      Done
            CFO aggregates Done.
Warning: Unable to list entries on node nodeB. RPC: Port mapper failure - RPC:
          Timed out
```

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA has aborted the SFO phase of an optimized takeover of nodeB. In this case, nodeA does not have information about the takeover status of nodeB's aggregates.

```
cluster1::> storage failover show-takeover
Node      Node Status      Aggregate      Takeover Status
-----
nodeA      Optimized takeover
            of partner aborted.
            Run the command
            "storage failover
            show-takeover -node
            nodeB" to display the
            relocation status of
            the partner.
            -
nodeB      Optimized takeover
            by partner aborted.
            aggr1      Failed: Destination node did
            not online the aggregate on
            time. To takeover the
            remaining aggregates, run the
            "storage failover takeover
            -ofnode nodeB
```

```

-bypass-optimization true"
command. To giveback the
relocated aggregates, run the
"storage failover giveback
-ofnode nodeB" command.
aggr2           Not attempted yet
CFO aggregates Not attempted yet.

```

storage failover takeover

Take over the storage of a node's partner

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage failover takeover` command initiates a takeover of the partner node's storage.

Parameters

{ -ofnode {<nodename>|local} - Node to Takeover

This specifies the node that is taken over. It is shut down and its partner takes over its storage.

| -bynode {<nodename>|local}} - Node Initiating Takeover

This specifies the node that is to take over its partner's storage.

[-option <takeover option>] - Takeover Option

This optionally specifies the style of takeover operation. Possible values include the following:

- **normal** - Specifies a normal takeover operation; that is, the partner is given the time to close its storage resources gracefully before the takeover operation proceeds. This is the default value.
- **immediate** - Specifies an immediate takeover. In an immediate takeover, the takeover operation is initiated before the partner is given the time to close its storage resources gracefully. The use of this option results in an immediate takeover which does not do a clean shutdown. In case of NDU this can result in a NDU failure.

Attention: If this option is specified, negotiated takeover optimization is bypassed even if the `-bypass-optimization` option is set to false.

Attention: If this option is specified, migration of data LIFs from the partner will be delayed even if the `-skip-lif-migration-before-takeover` option is not specified. If possible, migrate the data LIFs to another node prior to specifying this option.

- **allow-version-mismatch** - If this value is specified, the takeover operation is initiated even if the partner is running a version of software that is incompatible with the version running on the node. In this case, the partner is given the time to close its storage resources gracefully before the takeover operation proceeds. However, the takeover operation will not be allowed if the partner has higher WAFL or RAID label versions. Use this value as part of a nondisruptive upgrade or downgrade procedure.
- **force** - If this value is specified, the takeover operation is initiated even if the node detects an error that normally prevents a takeover operation from occurring. This value is available only at the advanced privilege level and higher.

Attention: If this option is specified, negotiated takeover optimization is bypassed even if the `-bypass-optimization` option is set to false.

CAUTION:

The use of this option can potentially result in data loss. If the HA interconnect is detached or inactive, or the contents of the failover partner's NVRAM cards are unsynchronized, takeover is normally disabled. Using the `-force` option enables a node to take over its partner's storage

despite the unsynchronized NVRAM, which can contain client data that can be lost upon storage takeover.

`[-bypass-optimization {true|false}] - Bypass Takeover Optimization`

If this is an operator-initiated planned takeover, this parameter specifies whether the takeover optimization is bypassed. This parameter defaults to false.

Attention: This parameter is ignored and negotiated takeover optimization automatically bypassed if the `-immediate` option, the `-force` option, or the `-allow-disk-inventory-mismatch` parameter is specified as part of the same `storage failover takeover` command.

`[-allow-disk-inventory-mismatch {true|false}] - Disk inventory`

If this parameter is specified, the takeover operation is initiated even if the local node cannot see the partner's filesystem disks.

Attention: If this parameter is specified, negotiated takeover optimization is bypassed even if the `-bypass-optimization` parameter is set to false.

CAUTION:

The use of this parameter can potentially result in client outage.

`[-skip-lif-migration-before-takeover [true]] - Skip Migrating LIFs Away from Node Prior to Takeover`

This parameter specifies that LIF migration prior to takeover is skipped. However if LIFs on this node are configured for failover, those LIFs may still failover after the takeover has occurred. Without this parameter, the command attempts to synchronously migrate data and cluster management LIFs away from the node prior to its takeover. If the migration fails or times out, the takeover is aborted.

`[-ignore-quorum-warnings [true]] - Skip Quorum Check Before Takeover`

If this parameter is specified, quorum checks will be skipped prior to the takeover. The operation will continue even if there is a possible data outage due to a quorum issue.

Examples

The following example causes a node named `node0` to initiate a negotiated optimized takeover of its partner's storage:

```
cluster1::> storage failover takeover -bynode node0
```

The following example causes a node named `node0` to initiate an immediate takeover of its partner's storage:

```
cluster1::> storage failover takeover -bynode node0 -option immediate
```

storage failover hwassist commands

Hardware assist functionality related commands

In a high-availability configuration, a storage controller monitors its partner's health using heartbeats. On storage controller failures, the takeover starts after a storage controller misses several heartbeats - which by default can take up to 15 seconds after the failure occurs. When the hardware-assisted takeover (hwassist) feature is enabled, the service processor of the storage controller (SP, RLM or BMC) is able to detect various failures, such as: Power Loss, Power Cycle, and POST Error. In these cases, the failover detection time is less than a second, allowing the takeover to start much sooner. Use the "storage failover modify" command to configure the hwassist feature.

storage failover hwassist show

Display hwassist status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage failover hwassist show` command displays information about hardware assisted takeover configurations. By default, the command displays the following information:

- Node name.
- Partner node name.
- Whether hardware assisted takeover is enabled.
- IP address on which the local node receives hardware assist alerts.
- Port on which local node receives hardware assist alerts.
- Hardware assist monitor status.
- If the monitor is inactive, the reason it is inactive.
- If the monitor is inactive, the corrective action to make it active.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the hwassist configurations that match this parameter value.

[-partner-name {<nodename>|local}] - Name of the Partner Node

Selects the hwassist configurations that match this parameter value.

[-enabled {true|false}] - Local Hardware Assist Enabled

Selects the hwassist configurations that match this parameter value.

[-local-status <text>] - Local Node's Hwassist Status

Selects the hwassist configurations that match this parameter value (*active* or *inactive*).

[-local-ip <text>] - IP Address on Which Local Node is Listening

Selects the hwassist configurations that match this parameter value.

[-local-port <integer>] - Port on Which Local Node is Listening

Selects the hwassist configurations that match this parameter value.

[-local-inactive <text>] - Local Node's Hwassist Inactive Status Reason

Selects the hwassist configurations that match this parameter value.

[-local-action <text>] - Corrective Action on Local Node

Selects the hwassist configurations that match this parameter value.

Examples

The following example displays the hardware assist information for the local node and its partner:

```
cluster1::> storage failover hwassist show
Node
-----
ha1
    Partner : ha2
    Hwassist Enabled : true
    Hwassist IP : 10.225.248.19
    Hwassist Port : 4444
    Monitor Status : active
    Inactive Reason : -
    Corrective Action : -
ha2
    Partner : ha1
```

```

storage failover hwassist test

Test the hwassist functionality

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage failover hwassist test` command tests the Hardware Assist h/w connectivity between the two nodes in a HA pair. The test result can be one of the following.

- Hardware Assist is not initialized.
- HW assist is not supported.
- Partner is throttling alerts.
- Resource is busy.
- Hardware Assist h/w returned an error.
- No response from partner.Timed out.
- Unexpected abort.
- Partner has taken over.
- Interconnect is down between nodes.
- Partner is not booted up yet.

Parameters

-node {<nodename>|local} - Node

This specifies the node from which a test alert is initiated.

Examples

The following command issues a test alert from the node cluster1-01:

```
cluster1::> storage failover hwassist test -node cluster1-01
```

```
Info: Operation successful.
```

storage failover hwassist stats commands

Hwassist statistics related commands

In a Hardware Assisted environment a node receives various alerts with from the partner node,periodically. Data ONTAP keeps track of all these alerts and maintains statistics about them. The user can see these statistics or clear them.

storage failover hwassist stats clear

Clear the hwassist statistics

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage failover hwassist stats clear` command clears the statistics information maintained by Hardware Assist functionality.

Parameters

-node {<nodename>|/local} - Node

This specifies the node on which the statistics are to be cleared.

Examples

The following example clears the hwassist statistics on the node cluster1-01:

```
cluster1::> storage failover hwassist stats clear -node cluster1-01
```

storage failover hwassist stats show

Display hwassist statistics

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage failover hwassist stats show` command displays statistics about the hardware assist alerts processed by a node. The command displays the following information for each alert:

- Locally enabled.
- Partner Inactive Reason.
- Alert type.
- Event that triggered the alert.
- The number of times the alert has been received.
- Whether takeover was possible on receiving the alert.
- The last time at which the alert was received.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|/local}] - Node

Selects the hwassist statistics for the specified node.

Examples

The following example displays the hwassist statistics for the node ha1:

```
cluster1::> storage failover hwassist stats show -node ha1
```

```
Node: ha1
Local Enabled: true
Partner Inactive Reason: -
```

Alert Type	Alert Event	Count	Takeover	Last Received
system_down	power_loss	0	Yes	---
system_down	l2_watchdog_reset	0	Yes	---
system_down	power_off_via_rlm	0	Yes	---
system_down	power_cycle_via_rlm	0	Yes	---
system_down	reset_via_rlm	0	Yes	---

```

system_down power_off_via_sp      0 Yes    ---
system_down power_cycle_via_sp    0 Yes    ---
system_down reset_via_sp          0 Yes    ---
system_down post_error            0 No     ---

            alerts_throttled      0 ---    ---

```

The following example displays the hwassist statistics for the node ha1 where hardware assist hardware is not supported.

```
cluster1::> storage failover hwassist stats show -node ha1
```

```

                Node: ha1
            Local Enabled: false
Partner Inactive Reason: HW assist is not supported on partner.

```

storage failover internal-options commands

Display the internal options for storage failover

This contains commands related to displaying and modifying internal options for storage failover of a node.

storage failover internal-options show

Display the internal options for storage failover

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage failover internal-options show` command displays the following information about the storage failover configuration:

- Node name
- Whether automatic giveback is enabled
- Whether partner checking is enabled
- Takeover detection time, in seconds
- Whether takeover on failover is enabled
- Whether takeover on panic is enabled
- Whether takeover on reboot is enabled
- Whether hardware-assisted takeover is enabled
- IP address on which the partner node listens to the hardware-assisted takeover alerts
- Port on which the partner node listens to the hardware-assisted takeover alerts
- Whether takeover on short uptime is enabled (detailed view only)
- Short uptime interval, in seconds (detailed view only)

- Number of giveback attempts (detailed view only)
- Giveback attempt interval, in minutes (detailed view only)
- Whether status is propagated through SFO mailboxes (detailed view only)
- Status read interval, in seconds (detailed view only)
- Status write interval, in seconds (detailed view only)
- Hardware-assisted takeover retry count (detailed view only)
- Hardware-assisted takeover heartbeat period (detailed view only)
- Whether operator-initiated planned takeover is optimized

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-more]

This parameter displays the following additional information: :

- Node name
- Whether takeover on short uptime is enabled
- Short uptime interval, in seconds
- Number of giveback attempts
- Giveback attempt interval, in minutes
- Whether status is propagated through SFO mailboxes
- Status read interval, in seconds
- Status write interval, in seconds
- Hardware-assisted takeover retry count
- Hardware-assisted takeover heartbeat period

| [-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects configuration information for the specified node.

[-auto-giveback {true|false}] - Auto Giveback Enabled

Selects configuration information for nodes that have the specified automatic giveback setting.

[-check-partner {true|false}] - Check Partner Enabled

Selects configuration information for nodes that have the specified partner-checking setting.

[-detection-time <integer>] - Takeover Detection Time (secs)

Selects configuration information for nodes that have the specified takeover detection time setting.

[-onfailure {true|false}] - Takeover on Failure Enabled

Selects configuration information for nodes that have the specified takeover-on-failure setting.

[-onpanic {true|false}] - Takeover on Panic Enabled

Selects configuration information for nodes that have the specified takeover-on-panic setting.

[-onshort-uptime {true|false}] - Takeover on Short Uptime Enabled

Selects configuration information for nodes that have the specified takeover-on-short-uptime setting.

[-short-uptime <integer>] - Short Uptime (secs)

Selects configuration information for nodes that have the specified takeover-on-short-uptime time setting.

[-attempts <integer>] - Number of Giveback Attempts

Selects configuration information for nodes that have the specified number of giveback attempts setting.

[-attempts-time <integer>] - Giveback Attempts Minutes

Selects configuration information for nodes that have the specified giveback attempt time setting.

[-propagate {true|false}] - Propagate Status via Mailbox

Selects configuration information for nodes that have the specified setting for propagation of status through Storage Failover mailboxes.

[-read-interval <integer>] - Node Status Read Interval (secs)

Selects configuration information for nodes that have the specified status read interval setting.

[-write-interval <integer>] - Node Status Write Interval (secs)

Selects configuration information for nodes that have the specified status write interval setting.

[-onreboot {true|false}] - Takeover on Reboot Enabled

Selects configuration information for nodes that have the specified takeover-on-reboot setting.

[-delay-seconds <integer>] - Delay Before Auto Giveback (secs)

If this parameter is specified, the command displays information only about the node or nodes that have the specified delay for auto giveback.

[-hwassist {true|false}] - Hwassist Enabled

Selects configuration information for nodes that have the specified hardware-assisted takeover setting.

[-hwassist-partner-ip <text>] - Partner's Hwassist IP

Selects configuration information for nodes that have the specified partner IP setting for hardware-assisted takeovers.

[-hwassist-partner-port <integer>] - Partner's Hwassist Port

Selects configuration information for nodes that have the specified partner port setting for hardware-assisted takeovers.

[-hwassist-health-check-interval <integer>] - Hwassist Health Check Interval (secs)

Selects configuration information for nodes that have the specified health check interval setting for hardware-assisted takeovers

[-hwassist-retry-count <integer>] - Hwassist Retry Count

Selects configuration information for nodes that have the specified retry count (in seconds) for hardware-assisted takeovers.

[-mode {ha|non_ha}] - HA Mode

If this parameter is specified, the command displays information only about the node or nodes that have the specified HA mode.

[-bypass-takeover-optimization {true|false}] - Bypass Takeover Optimization Enabled

Selects configuration information for nodes that have the specified setting for bypass takeover optimization (*true* means that optimized operator-initiated planned takeover is bypassed, *false* means that it is enabled). Operator-initiated planned takeover is optimized when SFO aggregates are relocated serially to the partner prior to takeover. This reduces client outage.

Examples

The following example displays detailed information about the internal options for storage failover on a node named node2:

```
cluster1::> storage failover internal-options show -node node2
```

```
Node: node2
Auto Giveback Enabled: false
Check Partner Enabled: true
```

```

Takeover Detection Time (secs): 15
Takeover On Failure Enabled: true
Takeover On Panic Enabled: false
Takeover On Short Uptime Enabled: true
Short Uptime (secs): -
Number of Giveback Attempts: 3
Giveback Attempts Minutes: 10
Propagate Status Via Mailbox: true
Node Status Read Interval (secs): 5
Node Status Write Interval (secs): 5
Failover the Storage when Cluster Ports Are Down: -
Failover Interval when Cluster Ports Are Down (secs): -
Takeover on Reboot Enabled: true
Delay Before Auto Giveback (secs): 300
Hardware Assist Enabled: true
Partner's Hw-assist IP:
Partner's Hw-assist Port: 4444
Hw-assist Health Check Interval (secs): 180
Hw-assist Retry count: 2
HA mode: ha
Bypass Takeover Optimization Enabled: true

```

storage failover mailbox-disk commands

Display the status of storage failover mailbox disks

Mailbox disks are part of root aggregate. High Availability related information is written persistently on mailbox disks. This directory contains command to display information related to local and partner mailbox disks.

storage failover mailbox-disk show

Display information about storage failover mailbox disks

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage failover mailbox-disk show` command lists the mailbox disks that are used by storage failover. The command displays the following information:

- Node name
- Whether the mailbox disk is owned by the local node or by its partner
- Disk name
- Disk universal unique identifier (UUID)

This command is available only at the advanced privilege level and higher.

Parameters

{ [-fields <fieldname>, ...]

If -fields <fieldname>,... is used, the command displays only the specified fields.

| [-instance]}

If this parameter is used, the command displays detailed information about all entries.

[-node {<nodename>|local}] - Node

Selects the mailbox disks that are associated with the specified node.

[-location {local|partner|tertiary}] - Mailbox Owner

Selects the mailbox disks that have the specified relationship to the node.

[-diskindex <integer>] - Mailbox Disk Index

Selects the mailbox disk that has the specified index number.

[-diskname <text>] - Mailbox Disk Name

Selects the mailbox disks that match the specified disk name.

[-diskuuid <text>] - Mailbox Disk UUID

Selects the mailbox disks that match the specified UUID.

[-physical-location {local|partner|mediator}] - Mailbox Disk Physical Location

Selects the mailbox disks that match the specified physical location.

[-location-id <nvrmaid>] - System ID of the Node where the Disk is Attached

Selects the mailbox disks that match the specified location-id.

[-location-name <text>] - Mailbox Disk Location

Selects the mailbox disks that match the specified location-name.

Examples

The following example displays information about the mailbox disks on a node named node1:

```
cluster1::*> storage failover mailbox-disk show -node node1
```

Node	Location	Index	Disk Name	Physical Location	Disk UUID

node1					
	local	0	1.0.4	local	20000000:8777E9D6:[...]
	local	1	1.0.6	partner	20000000:8777E9DE:[...]
	partner	0	1.0.1	local	20000000:877BA634:[...]
partner	1	1.0.2		partner	20000000:8777C1F2:[...]

storage failover progress-table commands

Display the storage failover progress table

storage failover progress-table show

Display status information about storage failover operations

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage failover progress-table show` displays status information about storage-failover operations. This information is organized in a resource table. The command displays the following information:

- Node name
- Resource-entry index number
- Resource-entry name
- Resource-entry state
- Resource-entry failure code
- Resource-entry time delta

This command is available only at the advanced privilege level and higher.

Parameters

{ **[-fields <fieldname>, ...]**

If `-fields <fieldname>, ...` is used, the command will only displays only the specified fields.

| **[-instance]**

If this parameter is used, the command displays detailed information about all entries.

[-node {<nodename>|local}] - Node

Selects the status information for the specified node.

[-index <integer>] - Resource Table Index

Selects the status information for the specified index number.

[-entryname <text>] - Resource Table Entry Name

Selects the status information for the specified entry name.

[-state <text>] - Resource Table Entry State

Selects the status information for the specified state. Possible values include UP, START_RUNNING, START_DONE, START_FAILED, STOP_RUNNING, STOP_FAILED, TAKEOVER_BARRIER, and ONLY_WHEN_INITD.

[-failurecode <text>] - Entry Failure Code

Selects the status information for the specified failure code. Possible values include OK, FAIL, FAIL_ALWAYS, HANG, PANIC, and VETO.

[-timedelta <integer>] - Entry Time Delta

Selects the status information for the specified time delta.

Examples

The following example displays the entire storage-failover resource table:

```
cluster1:* storage failover progress-table show
Node  Entry Name                               State      Time Delta

```

storage firmware commands

Download disk, ACP Processor and shelf firmware

storage firmware download

Download disk, ACP processor and shelf firmware

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage firmware download` command downloads ACP processor, disk and shelf firmware to a specified node.

Use the “[storage disk firmware update](#)” on page 895 command to install downloaded disk firmware.

Use the “[system node run](#)” on [page 1151](#) local storage download shelf command to install downloaded disk shelf module firmware.

Use the “[system node run](#)” on [page 1151](#) local storage download acp command to install downloaded ACP processor firmware.

Parameters

-node {<nodename>|local} - Node

This specifies the node to which the firmware is to be downloaded.

-package-url <text> - Package URL

This specifies the path to the firmware package.

The following URL protocols are supported: ftp, http, tftp and file. The file URL scheme can be used to specify the location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as *file://usb0/<filename>*. The package must be present in the root directory of the USB mass storage device.

Examples

The following example downloads a disk firmware package with the path *ftp://example.com/fw/disk-fw-1.2.LOD.zip* to a node named *node1*:

```
cluster1::> storage firmware download -node node1 -package-url ftp://example.com/fw/disk-fw-1.2.LOD.zip
```

storage firmware acp commands

Manage storage ACP firmware files

storage firmware acp delete

Delete an ACP firmware file

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage firmware acp delete` command deletes the specified ACP processor firmware file from all nodes that are currently part of the cluster.

Parameters

-filename <text> - Firmware Filename

Specifies the firmware file to delete.

Examples

The following example deletes the ACP processor firmware file with the name ACP-IOM3.0150.AFW.FVF on each node:

```
cluster1::*> storage firmware acp delete -filename ACP-IOM3.0150.AFW.FVF
```

storage firmware acp rename

Rename an ACP firmware file

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage firmware acp rename` command renames the specified ACP processor firmware file on each node.

Parameters

-oldname <text> - Old Filename

This parameter specifies the firmware file to rename.

-newname <text> - New Filename

This parameter specifies the new name of the firmware file.

Examples

The following example renames the ACP processor firmware file with the name ACP-IOM3.0150.AFW.FVF to ACP-IOM3.AFW.FVF on each node:

```
cluster1::*> storage firmware acp rename -oldname ACP-IOM3.0150.AFW.FVF -newname ACP-IOM3.AFW.FVF
```

storage firmware acp show

Display the list of ACP firmware files on the given node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage firmware acp show` command displays the ACP processor firmware files present on each node.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the files that match the specified node name.

[-filename <text>] - Storage Firmware File

Selects the files that match the specified filename.

Examples

The following example displays the ACP processor firmware files on each node:

```
cluster1::> storage firmware acp show

Node: Node1

ACP Firmware Files
-----
ACP-IOM3.0150.AFW.FVF
ACP-IOM3.AFW
ACP-IOM6.0210.AFW
ACP-IOM6.0210.AFW.FVF

Node: Node2

ACP Firmware Files
-----
ACP-IOM3.0150.AFW.FVF
ACP-IOM3.AFW
ACP-IOM6.0210.AFW
```

ACP-IOM6.0210.AFW.FVF
8 entries were displayed.

storage firmware disk commands

Manage storage disk firmware files

storage firmware disk delete

Delete a disk firmware file

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage firmware disk delete` command deletes the specified disk firmware file on each node.

Parameters

-filename <text> - Storage Firmware Filename

Specifies the firmware file to delete.

Examples

The following example deletes the disk firmware file with the name `X262_SMOOST25SSX.NA06.LOD` on each node:

```
cluster1::*> storage firmware disk delete -filename X262_SMOOST25SSX.NA06.LOD
```

storage firmware disk rename

Rename a disk firmware file

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage firmware disk rename` command renames the specified disk firmware file on each node.

Parameters

-oldname <text> - Old Filename

This parameter specifies the firmware file to rename.

-newname <text> - New Filename

This parameter specifies the new name of the firmware file.

Examples

The following example renames the disk firmware file with the name `X262_SMOOST25SSX.NA06.LOD` to `X262_SMOOST25SSX.LOD` on each node:

```
cluster1::*> storage firmware disk rename -oldname X262_SMOOST25SSX.NA06.LOD -newname X262_SMOOST25SSX.LOD
```

storage firmware disk show

Display the list of disk firmware files on the given node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage firmware disk show` command displays the disk firmware files present on each node.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|/local}] - Node

Selects the files that match the specified node name.

[-filename <text>] - Storage Firmware File

Selects the files that match the specified filename.

Examples

The following example displays the disk firmware files on each node:

```
cluster1::> storage firmware disk show

Node: Node1

Disk Firmware Files
-----
X262_SM00ST25SSX.NA06.LOD
X262_SM00ST25SSX.NA06.LOD.FVF
X267_SM00ST50SSX.NA06.LOD
X267_SM00ST50SSX.NA06.LOD.FVF

Node: Node2

Disk Firmware Files
-----
X262_SM00ST25SSX.NA06.LOD
X262_SM00ST25SSX.NA06.LOD.FVF
X267_SM00ST50SSX.NA06.LOD
X267_SM00ST50SSX.NA06.LOD.FVF
8 entries were displayed.
```

storage firmware shelf commands

Manage storage shelf firmware files

storage firmware shelf delete

Delete a shelf firmware file

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage firmware shelf delete` command deletes the specified shelf firmware file from all nodes that are currently part of the cluster.

Parameters

-filename <text> - Storage Firmware Filename

Specifies the firmware file to delete.

Examples

The following example deletes the shelf firmware file with the name IOM12.0210.SFW on each node:

```
cluster1::*> storage firmware shelf delete -filename IOM12.0210.SFW
```

storage firmware shelf rename

Rename a shelf firmware file

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage firmware shelf rename` command renames the specified shelf firmware file on each node.

Parameters

-oldname <text> - Old Filename

This parameter specifies the firmware file to rename.

-newname <text> - New Filename

This parameter specifies the new name of the firmware file.

Examples

The following example renames the shelf firmware file with the name IOM12.0210.SFW to IOM12.000.SFW on each node:

```
cluster1::*> storage firmware shelf rename -oldname IOM12.0210.SFW -newname IOM12.000.SFW
```

storage firmware shelf show

Display the list of shelf firmware files on the given node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage firmware shelf show` command displays the shelf firmware files present on each node.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the files that match the specified node name.

[-filename <text>] - Storage Firmware File

Selects the files that match the specified filename.

Examples

The following example displays the shelf firmware files on each node:

```
cluster1::> storage firmware shelf show

Node: Node1

Shelf Firmware Files
-----
AT-FCX.3800.SFW
AT-FCX.3800.SFW.FVF
ESH4.1400.SFW
ESH4.1400.SFW.FVF

Node: Node2
```

```
Shelf Firmware Files
-----
AT-FCX.3800.SFW
AT-FCX.3800.SFW.FVF
ESH4.1400.SFW
ESH4.1400.SFW.FVF
8 entries were displayed.
```

storage iscsi-initiator commands

Configure the iSCSI initiator

The `storage iscsi-initiator` commands configure the list of iSCSI targets. These commands are only supported on high-availability shared-nothing virtualized platforms.

storage iscsi-initiator add-target

Add an iSCSI target

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage iscsi-initiator add-target` command adds an iSCSI target to a node's list of targets. This command is only supported on high-availability shared-nothing virtualized platforms.

Parameters

-node <nodename>|local - **Node**

Specifies the name of the Data ONTAP node to which the iSCSI target will be added.

-label <text> - **User Defined Identifier**

Specifies a label for the target to be added.

-target-type {external|mailbox|partner|dr_auxiliary|dr_partner} - **Target Type**

Specifies the type of the target. It is used by the node to determine how to use the LUNs. There are five target types:

- **partner** - The partner target should belong to the node's HA partner. This allows the node to access its partner's disks.
- **mailbox** - A mailbox target's LUNs are used exclusively as HA mailboxes.
- **external** - External targets' LUNs can be used by the node but do not play a role in HA.
- **dr_auxiliary** - The DR auxiliary target for MetroCluster over IP. Not a valid target type for the `add-target` command.
- **dr_partner** - The DR partner target for MetroCluster over IP. Not a valid target type for the `add-target` command.

-target-portal <text> - **Target Portal**

Specifies the target's IP address and listening TCP port. The port is not required if it is the default iSCSI port (3260). Examples of correct target portals are `10.0.0.2` and `10.0.0.2:860`.

-target-name <text> - **iSCSI Name**

Specifies the iSCSI target name such as an IQN (iSCSI qualified name).

[-status-admin {down|up}] - **Administrative Status (default: up)**

Use to specify whether the initial administrative status of the connection is up or down. The default setting is *up*.

Examples

The following example adds and connects to an iSCSI target from the specified node.

```
cluster1::*> storage iscsi-initiator add-target -node node1
               -label target1 -target-type external
               -target-portal 10.0.0.2:860
               -target-name iqn.2012-06.com.bsdctl:target0
```

storage iscsi-initiator connect

Connect to an iSCSI target

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage iscsi-initiator connect` command connects a node to the specified target. This command is only supported on high-availability shared-nothing virtualized platforms.

Parameters

-node {<nodename>|local} - Node

Specifies the name of the Data ONTAP node to which the iSCSI target will be connected.

[-target-type {external|mailbox|partner|dr_auxiliary|dr_partner}] - Target Type

Selects targets with the specified target type.

-label <text> - User Defined Identifier

Specifies the label of the target to connect to.

Examples

The following example adds and connects to an iSCSI target from the specified node.

```
cluster1::*> storage iscsi-initiator connect -node node1
               -label target1
```

storage iscsi-initiator disconnect

Disconnect from an iSCSI target

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage iscsi-initiator disconnect` command disconnects a node from the specified target. This command is only supported on high-availability shared-nothing virtualized platforms.

Parameters

-node {<nodename>|local} - Node

Specifies the name of the Data ONTAP node from which the iSCSI target will be disconnected.

[-target-type {external|mailbox|partner|dr_auxiliary|dr_partner}] - Target Type

Selects targets with the specified target type.

-label <text> - User Defined Identifier

Specifies the label of the target to disconnect from.

Examples

The following example adds and connects to an iSCSI target from the specified node.

```
cluster1::*> storage iscsi-initiator disconnect -node node1
               -label target1
```

storage iscsi-initiator remove-target

Remove an iSCSI target

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage iscsi-initiator remove-target` command removes an iSCSI target from a node's list of targets. This command is only supported on high-availability shared-nothing virtualized platforms.

Parameters

-node {<nodename>|local} - Node

Specifies the name of the Data ONTAP node from which the iSCSI target will be removed.

[-target-type {external|mailbox|partner|dr_auxiliary|dr_partner}] - Target Type

Selects targets with the specified target type.

-label <text> - User Defined Identifier

Specifies the label of the target to be removed.

Examples

The following example adds and connects to an iSCSI target from the specified *node*.

```
cluster1::*> storage iscsi-initiator remove-target -node node1
               -label target1
```

storage iscsi-initiator show

Display the iSCSI targets

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage iscsi-initiator show` displays the list of iSCSI targets configured for each Data ONTAP node in the cluster. This command is only supported on high-availability shared-nothing virtualized platforms.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Represents the name of the Data ONTAP node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

[-target-type {external|mailbox|partner|dr_auxiliary|dr_partner}] - Target Type

Selects targets with the specified target type.

[-label <text>] - User Defined Identifier

Selects targets with the specified label.

[-target-portal <text>] - Target Portal

Selects targets with the specified portal.

[-target-name <text>] - iSCSI Name

Selects targets with the specified target name.

[-status-admin {down|up}] - Administrative Status

Selects targets with the specified administrative status.

[-status-oper {down|up}] - Operational Status

Selects targets with the specified operational status.

[-failure-reason <text>] - Failure Reason

Selects targets with the specified failure reason.

Examples

The following example displays the list of iSCSI targets for each node in the cluster.

```
cluster1::*> storage iscsi-initiator show
```

Node	Type	Label	Target Portal	Target Name	Status Admin/Op

node1					
	mailbox				
	mediator	10.235.14.141		iqn.2012-05.local:mailbox.group.1	up/up
	partner				
	partner	10.63.7.205:65200		iqn.2012-06.com.bsdctl:target0	up/up
node2					
	mailbox				
	mediator	10.235.14.141		iqn.2012-05.local:mailbox.group.1	up/up
	partner				
	partner	10.63.7.201:65200		iqn.2012-06.com.bsdctl:target0	up/up

4 entries were displayed.

storage load commands

The load directory

storage load balance

Balance storage I/O across controller's initiator ports

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command is obsolete. I/O load is balanced automatically every five minutes.

Parameters

-node {<nodename>|local} - Node to balance on

The name of the clustered node for which information is being displayed.

Examples

storage load show

Display I/O statistics to array LUNs, grouped by initiator port.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command is obsolete. The `storage load show` command displays the load distribution of I/O on the cluster.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-switch]

The switch parameter adds switch information to the display.

| [-instance]}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|/local/}] - Controller name

The name of the clustered node for which information is being displayed.

[-initiator-port <text>] - Initiator Port

The initiator port of the array LUN for which I/O stats are being displayed.

[-wwpn <text>] - Target Port WWPN

The World Wide Port Name of the array LUN for which I/O stats are being displayed.

[-serialnumber <text>] - Serial Number

The serial number of the array LUN for which I/O stats are being displayed.

[-lun <integer>] - LUN

The array LUN for which I/O stats are being displayed.

[-pct-io <text>] - %I/O

Percent of I/O bandwidth consumed by this array LUN.

[-io-blocks <integer>] - I/O (blocks)

Number of I/O blocks transferred.

[-switch-port <text>] - Switch Port

The initiator side switch port for this array LUN.

[-target-side-switch-port <text>] - Target Side Switch Port

The target side switch port for this array LUN.

Examples

```
cluster1::> storage load show -switch
Initiator port: 0a connected to vnbr3850s4:7.
```

LUN	Serial #	Target Port	Target Side Switch Port	%I/O	I/O (blocks)
1	D600020C00D3	50060e80004291c0	vnbr3850s5:12	0	0
2	D600020C00D4	50060e80004291c0	vnbr3850s5:12	100	21
5	D600020C00EF	50060e80004291c0	vnbr3850s5:12	0	0

Initiator port: 0c connected to vnci9124s54:1-11.

Target Side

LUN	Serial #	Target Port	Switch Port	%I/O	I/O (blocks)
3	D600020C00D9	50060e80004291c2	vnci9124s54:1-22	42	8
4	D600020C00DA	50060e80004291c2	vnci9124s54:1-22	36	7
6	D600020C00F0	50060e80004291c2	vnci9124s54:1-22	15	3

storage path commands

The path directory

storage path quiesce

Quiesce I/O on a path to array

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage path quiesce` command quiesces I/O on one path to a LUN. It also quiesces the given entire path immediately or can monitor the given path for error threshold before quiesce. After the I/O has been quiesced, no new I/O is sent on the path unless the “[storage path resume](#)” on [page 953](#) command is issued to continue I/O.

Parameters

-node {<nodename>|local} - **Node name**

The name of the clustered node for which information is being displayed.

-initiator <initiator name> - **Initiator Port**

Initiator port that the clustered node uses.

-target-wwpn <wwpn name> - **Target Port**

Target World Wide Port Name. Port on the storage array that is being used.

{ [-lun-number <integer>] - **LUN Number**

Logical Unit number. The range is: [0...65535]. If this parameter is not specified, Data ONTAP resumes the entire path to an array.

[-path-failure-threshold <integer>] - **Max Number of Path Failures Acceptable During wait-duration**

The path failure count, exceeding this value within wait duration will quiesce the path.

[-wait-duration <integer>]] - **Wait Duration in minutes**

The time duration(minutes) in which path is monitored for path failures.

Examples

The following example suspends I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669, LUN 1.

```
node::> storage path quiesce -node vbv3170f1b -initiator 0a -target-wwpn 50001fe1500a8669 -lun-number 1
```

The following example suspends I/O immediately between node vbv3170f1b, port 0a and the array port 50001fe1500a8669.

```
node::> storage path quiesce -node vbv3170f1b -initiator 0a -target-wwpn 50001fe1500a8669
```

The following example suspends I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669 after reaching 10 or more errors in duration of 5 mins.

```
node::> storage path quiesce -node vbv3170f1b -initiator 0a -target-wwpn 50001fe1500a8669 -path-failure-threshold 10 -wait-duration 5
```

storage path resume

Resume I/O on a path to array

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage path resume` command continues I/O flow to an array LUN on a path or the entire path that was previously quiesced. It also disables the path failures monitoring feature, if it was enabled using the [“storage path quiesce” on page 952](#) `-path-failure-threshold count` command.

Parameters

-node {<nodename>|local} - Node name

The name of the clustered node for which information is being displayed.

-initiator <initiator name> - Initiator Port

Initiator port that the clustered node uses.

-target-wwpn <wwpn name> - Target Port

Target World Wide Port Name. Port on the storage array that is being used.

[-lun-number <integer>] - LUN Number

Logical Unit number. The range is: [0...65535]. If this parameter is not specified, Data ONTAP resumes the entire path to an array.

Examples

The following example resumes I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669, LUN 1

```
node::> storage path resume -node vbv3170f1b -initiator 0a -target-wwpn 50001fe1500a8669 -lun-number 1
```

The following example resumes I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669

```
node::> storage path resume -node vbv3170f1b -initiator 0a -target-wwpn 50001fe1500a8669
```

storage path show

Display a list of paths to attached arrays.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage path show` command displays path based statistics. The default command shows:

- Node name
- Initiator port
- Target port
- Target IQN
- TPGN
- Port speeds
- Path I/O in Kbytes/sec
- IOPs

Parameters

{ **[-fields** <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| **[-array]**

Using this option displays:

- Array name
- Target port
- Target IQN
- Target I/O in Kbytes/sec
- Target side switch port
- Path I/O in Kbytes/sec
- Initiator side switch port
- Initiator I/O in Kbytes/sec
- Initiator port

| **[-by-target]**

Using this option displays the same information as the array option, but grouped by target port.

| **[-detail]**

Using this option displays the same information as the array and by-target options, but adds the following:

- Target IOPs
- Target LUNs
- Path IOPs
- Path errors
- Path quality
- Path LUNs
- Initiator IOPs
- Initiator LUNs

| **[-switch]**

Using this option adds switch port information to the default display.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Controller name

The name of the clustered node for which information is being displayed.

[-array-name <array name>] - Array Name

Name of the storage array that is connected to the cluster.

[-target-wwpn <text>] - Target Port

Target World Wide Port Name. Port on the storage array that is being used.

[-initiator <text>] - Initiator Port

Initiator port that the clustered node uses.

[-initiator-side-switch-port <text>] - Initiator Side Switch Port

Switch port connected to the clustered node.

[-tpgn <integer>] - Target Port Group Number

TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

[-port-speed <text>] - Port Speed

Port Speed of the specified port.

[-path-io-kbps <integer>] - Kbytes of I/O per second on Path (Rolling Average)

Rolling average of I/O per second on the path.

[-path-iops <integer>] - Number of IOPS on Path (Rolling Average)

Rolling average of Kbytes of I/O per second on the path

[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator (Rolling Average)

Rolling average of I/O per second on the initiator port.

[-initiator-iops <integer>] - Number of IOPS on Initiator (Rolling Average)

Rolling average of Kbytes of I/O per second on the initiator port.

[-target-io-kbps <integer>] - Kbytes of I/O per second to Target (Rolling Average)

Rolling average of I/O per second on the target port.

[-target-iops <integer>] - Number of IOPS to Target (Rolling Average)

Rolling average of Kbytes of I/O per second on the target port.

[-target-side-switch-port <text>] - Target Side Switch Port

Switch port connected to the array.

[-path-link-errors <integer>] - Link Error count on path

Fibre Channel link error count.

[-path-quality <integer>] - Percentage of weighted error threshold

A number representing the threshold of errors that is allowed on the path. Path quality is a weighted error value. When the error weight of a path exceeds the threshold, I/O is routed to a different path.

[-path-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this path

Number of LUNs on this path.

[-initiator-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this initiator

Number of LUNs on this initiator.

[-target-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this target

Number of LUNs on this target.

[-vmdisk-device-id <integer>] - Virtual disk device ID

Common device identifier, shared by a VM and its hypervisor, of a virtual disk. On ESX servers, this is the Disk ID component of a virtual device node, with a value of 0 to 15.

[-path-failure-threshold <integer>] - Max number of path failures acceptable in wait-duration

The path failure count, exceeding this value within wait duration will quiesce the path.

[-wait-duration <integer>] - Wait Duration in minutes

The time duration(minutes) in which path is monitored for path failures.

Examples

The following example shows the default display.

```
vbv3170f2a::> storage path show
```

Node	Initiator	Array Target Port	TPGN	Speed	Path I/O (KB/s)	IOPS
vbv3170f2a-01	0b	50001fe1500a866c	2	2 Gb/S	6	2
vbv3170f2a-01	0b	50001fe1500a866d	2	2 Gb/S	0	0
vbv3170f2a-01	0c	50001fe1500a866e	4	4 Gb/S	0	0
vbv3170f2b-03	0a	50001fe1500a866d	1	2 Gb/S	3	1
vbv3170f2b-03	0c	50001fe1500a866f	4	4 Gb/S	3	1

5 entries were displayed.

The following example shows how the information is displayed with the array option.

```
vnv3070f20b::> storage path show -array
```

Node: vnv3070f20b

5 entries were displayed.

storage path show-by-initiator

Display a list of paths to attached arrays from the initiator's perspective

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage path show-by-initiator` command displays path based statistics. The output is similar to the [“storage path show” on page 953](#) command but the output is listed by initiator.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Controller name

The name of the clustered node for which information is being displayed.

[-initiator <text>] - Initiator Port

Initiator port that the clustered node uses.

[-target-wwpn <text>] - Target Port

Target World Wide Port Name. Port on the storage array that is being used.

[-initiator-side-switch-port <text>] - Initiator Side Switch Port

Switch port connected to the clustered node.

[-target-side-switch-port <text>] - Target Side Switch Port

Switch port connected to the array.

[-array-name <array name>] - Array Name

Name of the storage array that is connected to the cluster.

[-tpgn <integer>] - Target Port Group Number

TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

[-port-speed <text>] - Port Speed

Port Speed of the specified port.

[-path-io-kbps <integer>] - Kbytes of I/O per second on Path (Rolling Average)

Rolling average of I/O per second on the path.

[-path-iops <integer>] - Number of IOPS on Path (Rolling Average)

Rolling average of Kbytes of I/O per second on the path

[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator (Rolling Average)

Rolling average of I/O per second on the initiator port.

[-initiator-iops <integer>] - Number of IOPS on Initiator (Rolling Average)

Rolling average of Kbytes of I/O per second on the initiator port.

[-target-io-kbps <integer>] - Kbytes of I/O per second to Target (Rolling Average)

Rolling average of I/O per second on the target port.

[-target-iops <integer>] - Number of IOPS to Target (Rolling Average)

Rolling average of Kbytes of I/O per second on the target port.

Examples

```
vnv3070f20b::> storage path show-by-initiator
Node: vnv3070f20b
```

Initiator	Initiator I/O (KB/s)	Initiator Side Switch Port	Path I/O (KB/s)	Target Side Switch Port	Target I/O (KB/s)	Target Port	Array Name

Storage pool Commands

Manage storage pools

The `storage pool` command family provides the ability to create and manage SSD storage pools. Storage pools are collections of solid-state disks (SSDs) that can be shared between multiple Flash Pool or All-Flash aggregates and between two nodes of an HA pair.

A storage pool's capacity cannot be shared between Flash Pool and All-Flash aggregates at the same time.

For provisioning storage pool capacity into All-Flash aggregates, the `vserver` option `raid.storagepool.data.enable` must be set to `true`. The storage pool data enabled mode of operation is not currently supported by ThinkSystem Storage management software.

The use of SSD storage pools is optional. Aggregates can use whole SSDs, or they can use SSD capacity from storage pools. When multiple aggregates share the SSD capacity from an SSD storage pool, there is a reduction in parity overhead and you have the ability to share high SSD performance across multiple aggregates and across both nodes of an HA pair. A storage pool contains a minimum of 3 and a maximum of 29 SSDs.

When an SSD storage pool is created using the [“storage pool create” on page 960](#) command, the SSDs are divided into four equal-sized partitions. The capacity of the group of disks is expressed in terms of allocation units. Each allocation unit is 25% of the capacity. The storage pool initially contains unprovisioned allocation units which can be displayed using the [“storage pool show-available-capacity” on page 966](#) command.

In an HA configuration, each node takes ownership of two allocation units representing 50% of the total capacity. If desired, the ownership of the allocation units can be adjusted using the [“storage pool reassign” on page 962](#) command before the capacity is used in an aggregate.

Storage pools do not have an associated RAID type. The RAID type is determined when an allocation unit is added to an aggregate using the [“storage aggregate add-disks” on page 756](#) command. A storage pool contains four allocation units, and they might be used in up to four aggregates. You can add multiple allocation units to a Flash Pool or All-Flash aggregate to increase its cache or usable capacity respectively.

The space in an SSD storage pool can be expanded by adding SSDs to the storage pool using the [“storage pool add” on page 959](#) command. The size of each of the four allocation units will expand by 25% of the capacity of the disks being added. For example, if an SSD with a usable size of 745 GB is added to a storage pool that is part of four aggregates, each aggregate will grow its cache or usable capacity by 186.25 GB. If a different allocation is desired, create a new SSD storage pool using the [“storage pool create” on page 960](#) command.

All storage pool available capacity can be provisioned into aggregates. Available capacity within a storage pool is not used to protect against a disk failure. In the case of an SSD failure or predicted failure, Data

ONTAP moves a suitable whole spare SSD from outside the storage pool into the storage pool and begins the recovery process(using either reconstruction or Rapid RAID Recovery, whichever is appropriate).

storage pool add

Add disks to a storage pool

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage pool add` command increases the total capacity of an existing storage pool by adding the specified SSDs to the storage pool. The disks are split into four equal partitions and added to each of the allocation units of the storage pool. If any allocation units from the storage pool have already been allocated to an aggregate, the cache or usable capacity of that aggregate is increased depending on whether it is a Flash Pool or an All-Flash aggregate.

If capacity from a storage pool is already provisioned into a Flash Pool aggregate, the same storage pool cannot be used to provision an All-Flash aggregate and vice-versa.

For provisioning storage pool capacity into All-Flash aggregates, the Vserver option `raid.storagepool.data.enable` must be set to `true`. The storage pool data enabled mode of operation is not currently supported by ThinkSystem Storage management software.

For example, if an SSD with a usable size of 745 GB is added to a storage pool that is part of four aggregates, each aggregate will grow its cache or usable capacity by 186.2 GB. If a different allocation is desired, create a new storage pool using the [“storage pool create” on page 960](#) command.

Parameters

-storage-pool <storage pool name> - Storage Pool Name

This parameter specifies the storage pool to which disks are to be added.

{ [-disk-count <integer>] - Number of Disks to Add in Storage Pool

This parameter specifies the number of disks that are to be added to the storage pool. The disks to be added come from the pool of spare disks.

[-nodes {<nodename>|local}, ...] - Nodes From Which Spares Should be Selected

This parameter specifies a list of nodes from which SSD disks are selected for addition to the storage pool. If this parameter is not specified, disks to be added to the storage pool can be selected from both the nodes sharing the storage pool. Use this parameter to restrict the selection of spare disks to one particular node.

| [-disk-list <disk path name>, ...] - List of Spare Disks

This parameter specifies a list of disks to be added to the storage pool. In an HA configuration, SSDs being added to a storage pool can be owned by either node in the HA pair.

{ [-quiet [true]] - Confirmations off (privilege: advanced)

When set to `true`, this parameter specifies the operation should be executed without pausing for confirmation.

| [-simulate [true]] - Simulate Storage Pool Addition

When set to `true`, this parameter specifies the operation should be performed as a simulation. The command reports which aggregates would grow automatically as a result of adding the disks to the storage pool. The disks are not added to the storage pool.

Examples

In this example, the user requests a report detailing the changes that would occur if a new disk is added to the storage pool `SP1`. In this case, 186.2 GB of cache is added to the Flash Pool aggregates `nodeA_`

flashpool_1 and nodeB_flashpool_1. There are two unprovisioned allocation units in the storage pool and therefore the storage pool available capacity also grows by 372.5 GB.

```
cluster1::> storage pool add -storage-pool SP1 -disk-list 1.0.23 -simulate
```

This operation will result in capacity being allocated in the following way:

Container Name	Capacity To Be Added	Current Size	New Size
nodeA_flashpool_1	186.2GB	558.7GB	744.9GB
nodeB_flashpool_1	186.2GB	558.7GB	744.9GB
(Available Capacity)	372.5GB	1.09TB	1.45TB

Check via simulation whether there is available capacity within allocation units in storage pool *SP1* for allocation units that are provisioned into aggregates.

```
cluster1::> storage pool add -storage-pool SP1 -simulate -auto-grow-aggregates true
```

Info: This operation results in capacity being allocated in the following way:

Container Name	Capacity To Be Added	Current Size	New Size
nodeA_flashpool_1	186.2GB	558.7GB	744.9GB
nodeB_flashpool_1	186.2GB	558.7GB	744.9GB

The following example adds one disk to a storage pool named *SP1*. The spare disks are selected from either local node or its partner or both based on spare availability.

```
cluster-1::> storage pool add -storage-pool SP1 -disk-count 1
```

Info: The following disks will be added to storage pool "SP1":

Disk	Size	Type	Owner
1.0.12	744.9GB	SSD	cluster-1-01

New Allocation Unit Size: 744.8GB

Capacity will be allocated in the following way:

Container Name	Capacity To Be Added	Current Size	New Size
nodeA_flashpool_1	186.2GB	558.7GB	744.9GB
nodeB_flashpool_1	186.2GB	558.7GB	744.9GB
(Available Capacity)	372.5GB	1.09TB	1.45TB

Are you sure you want to continue with this operation?

{y|n}: y

[Job 48] Job succeeded: storage pool add job for "SP1" completed successfully

storage pool create

Create a new storage pool

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage pool create` command creates an SSD storage pool using a given list of spare SSDs.

When a storage pool is created, Data ONTAP splits the capacity provided by the SSDs into four equally-sized allocation units. In an HA configuration, two allocation units (containing 50% of the total capacity) are assigned to each node in the HA pair. This assignment can be modified using the “[storage pool reassign](#)” on [page 962](#) command.

After the storage pool is created, its allocation units can be provisioned into Flash Pool or All-Flash aggregates using the “[storage aggregate add-disks](#)” on [page 756](#) command and the `-storage-pool` parameter.

If capacity from a storage pool is already provisioned into a Flash Pool aggregate, the same storage pool cannot be used to provision an All-Flash aggregate and vice versa.

For provisioning storage pool capacity into All-Flash aggregates, the vserver option `raid.storagepool.data.enable` must be set to `true`. The storage pool data enabled mode of operation is not currently supported by ThinkSystem Storage management software.

Parameters

-storage-pool <storage pool name> - Storage Pool Name

This parameter specifies the name of the storage pool that is to be created. The SSDs are partitioned and placed into the new storage pool.

[-nodes {<nodename>|local}, ...] - Nodes Sharing the Storage Pool

This parameter specifies a list of nodes from which SSD disks are selected to create the storage pool. If two nodes are specified then they need to be in HA configuration. Spare disks are selected from either node or its partner or both. If this parameter is not specified, storage pool will be created by selecting disks from either the node or its partner or both from where command is run.

-disk-count <integer> - Number of Disks in Storage Pool

This parameter specifies the number of disks that are to be included in the storage pool. The disks in this newly created storage pool come from the pool of spare disks. The smallest disks in this pool are added to the storage pool first, unless you specify the `-disk-size` parameter.

[-disk-size {<integer>[KB|MB|GB|TB|PB]}] - Disk Size

This parameter specifies the size of the disks on which the storage pool is to be created. Disks with a usable size between 95% and 105% of the specified size are selected.

| -disk-list <disk path name>, ...} - Disk List for Storage Pool Creation

This parameter specifies a list of SSDs to be included in the new storage pool. The SSDs must be spare disks and can be owned by either node in an HA pair.

[-simulate [true]] - Simulate Storage Pool Creation

This option simulates the storage pool creation and prints the allocation unit size that would be used for the storage pool.

Examples

The following example creates a storage pool named SP1. The storage pool contains 3 SSD disks, the spare disks selected are from either local node, or its partner or both based on spare availability.

```
cluster1::> storage pool create -storage-pool SP1 -disk-count 3
```

The following example creates a storage pool named SP2. The storage pool contains 3 SSD disks, the spare disks selected are from either node0, or its partner node1 or both based on spare availability.

```
cluster1::> storage pool create -storage-pool SP2 -disk-count 3 -nodes node0,node1
```

The following example creates a storage pool named SP3 from four SSDs using disk list.

```
cluster1::> storage pool create -storage-pool SP3 -disk-list 1.0.13, 1.0.15, 1.0.17, 1.0.19
```

storage pool delete

Delete an existing storage pool

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage pool delete` command deletes an existing SSD storage pool. At the end of the operation, the SSDs are converted back to spare disks.

Parameters

-storage-pool <storage pool name> - Storage Pool Name

This parameter specifies the storage pool that you want to delete. You can delete the storage pool only if all of the allocation units in the storage pool are available.

Examples

Verify that storage pool *SP3* is ready for deletion by confirming it has four available allocation units and then delete it.

```
cluster1:: storage pool show-available-capacity -storage-pool SP3
```

Node	Storage Pool	Type	SyncMirror Pool	Allocation Unit size	Unit Count	Total Usable Size
node-a	SP3	SSD	Pool0	372.5GB	2	744.9GB
node-b	SP3	SSD	Pool0	372.5GB	2	744.9GB

2 entries were displayed.

```
cluster1:: storage pool delete -storage-pool SP3
```

```
Warning: Are you sure you want to delete storage pool "SP3"? [y|n]: y
[Job 313] Job succeeded: storage pool delete job for "SP3" completed successfully
```

storage pool reassign

Reassign capacity from one node to another node in storage pool

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage pool reassign` command changes the ownership of unprovisioned (available) storage pool allocation units from one HA partner to the other for an existing storage pool.

Parameters

-storage-pool <storage pool name> - Storage Pool Name

This parameter specifies the storage pool within which available capacity is reassigned from one node to another.

-from-node {<nodename>|local} - Reassign Available Capacity from This Node

This parameter specifies the name of the node that currently owns the allocation units.

-to-node {<nodename>|local} - Reassign Available Capacity to This Node

This parameter specifies the name of the node that will now own the allocation units.

-allocation-units <integer> - Allocation Units

This parameter specifies the number of allocation units to be reassigned.

Examples

Move an available allocation unit from node-b to node-a in preparation for provisioning the allocation units on node-a.

```
cluster1::*> storage pool show-available-capacity -storage-pool SP2
```

Node	Storage Pool	Storage Type	SyncMirror Pool	Allocation Unit size	Unit Count	Total Usable Size
node-a	SP2	SSD	Pool0	744.9GB	2	1.45TB
node-b	SP2	SSD	Pool0	744.9GB	1	744.9GB

2 entries were displayed.

```
cluster1::*> storage pool reassign -storage-pool SP2 -from-node node-b -to-node node-a -allocation-units 1
[Job 310] Job succeeded: storage pool reassign job for "SP2" completed successfully
```

```
cluster1::*> storage pool show-available-capacity -storage-pool SP2
```

Node	Storage Pool	Storage Type	SyncMirror Pool	Allocation Unit size	Unit Count	Total Usable Size
node-a	SP2	SSD	Pool0	744.9GB	3	2.18TB
node-b	SP2	SSD	Pool0	744.9GB	0	0B

2 entries were displayed.

storage pool show

Display details of storage pools

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage pool show` command displays information about SSD storage pools in the cluster. By default, the command displays information about all storage pools in the cluster. You can specify parameters to limit the output to a specific set of storage pools.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-storage-pool <storage pool name>] - Storage Pool Name

Selects the storage pools that match this parameter value.

[-storage-pool-uuid <UUID>] - UUID of Storage Pool

Selects the storage pools that match this parameter value.

[-nodes {<nodename>|local}, ...] - Nodes Sharing the Storage Pool

Selects the storage pools that match this parameter value.

In an HA pair, either node name may be specified.

[-disk-count <integer>] - Number of Disks in Storage Pool

Selects the storage pools that match this parameter value.

[-allocation-unit-size {<integer>[KB|MB|GB|TB|PB]] - Allocation Unit Size

Selects the storage pools that match this parameter value.

Allocation units represent the unit of storage allocated to aggregates from this storage pool.

[-allocation-unit-data-size-raid4 {<integer>[KB|MB|GB|TB|PB]] - Allocation Unit Data Size for RAID4

This parameter shows the amount of additional data capacity provided if an allocation unit from this storage pool was added to an aggregate with `-raidtype` as `raid4`.

`[-allocation-unit-data-size-raid-dp {<integer>[KB|MB|GB|TB|PB]]` - Allocation Unit Data Size for RAID-DP

This parameter shows the amount of additional data capacity provided if an allocation unit from this storage pool was added to an aggregate with `-raidtype` as `raid_dp`.

`[-allocation-unit-data-size-raid-tec {<integer>[KB|MB|GB|TB|PB]]` - Allocation Unit Data Size for RAID-TEC

This parameter shows the amount of additional data capacity provided if an allocation unit from this storage pool was added to an aggregate with `-raidtype` as `raid_tec`.

`[-storage-type <SSD>]` - Storage Type

Selects the storage pools that match this parameter value.

Only the `SSD` type is supported for this version of Data ONTAP.

`[-pool-usable-size {<integer>[KB|MB|GB|TB|PB]]` - Storage Pool Usable Size

Selects the storage pools that match this parameter value.

The `pool-usable-size` is the sum of the capacities of the allocation units that are assigned to nodes but not yet provisioned. The amount of `pool-usable-size` that is contributed to the cache or usable capacity of an aggregate depends upon the RAID type used when provisioning the allocation units.

`[-pool-total-size {<integer>[KB|MB|GB|TB|PB]]` - Storage Pool Total Size

Selects the storage pools that match this parameter value.

The `pool-total-size` is the sum of the capacities of allocation units belonging to this storage pool.

`[-is-healthy {true|false}]` - Is Pool Healthy?

Selects the storage pools that match this parameter value.

For storage pools with `is-healthy false`, the `unhealthy-reason` parameter provides more information.

`is-healthy` must be `true` to provision allocation units from a storage pool into an aggregate.

`[-pool-state <State of the Storage Pool>]` - State of the Storage Pool

Selects the storage pools that match this parameter value. Possible states are:

- `normal` - the storage pool is operating normally.
- `degraded` - the storage pool has one or more failed disks.
- `creating` - the storage pool is being created.
- `deleting` - the storage pool is being deleted.
- `reassigning` - allocation units are being reassigned from one node to another.
- `growing` - allocation units in the storage pool are expanding due to the addition of new capacity into the storage pool.

`[-unhealthy-reason <text>]` - Reason for Storage Pool Being Unhealthy

Selects the storage pools that match this parameter value.

The message provided gives additional details about why the storage pool is unhealthy.

`[-current-operation-job-id <integer>]` - Job ID of the Currently Running Operation

Selects the storage pools that match this parameter value.

Long-running operations associated with storage pools will be managed via jobs. For example, if you provision allocation units from a storage pool into an aggregate and the disks associated with the storage pool need to be zeroed, the operation will be completed via a job.

Examples

Display the storage pools in the cluster.

```
cluster1::> storage pool show
Storage Pool      Type  #Disks Nodes      Total Size
-----
LargeSP           SSD    10 noda-a,node-b  7.27TB
SmallSP           SSD     2 noda-a,node-b  1.45TB
2 entries were displayed.
```

The following example displays the details of a storage pool named SmallSP. Only one of its four allocation unit has been provisioned, so 75% of its size is available (usable).

```
cluster1::> storage pool show -storage-pool SmallSP

Storage Pool Name: SmallSP
UUID of Storage Pool: 60f2f1b9-e60f-11e3-a5e7-00a0981899a2
Nodes Sharing the Storage Pool: node-a, node-b
Number of Disks in Storage Pool: 2
Allocation Unit Size: 372.5GB
Storage Type: SSD
Storage Pool Usable Size: 1.09TB
Storage Pool Total Size: 1.45TB
Is Pool Healthy?: true
State of the Storage Pool: normal
Reason for storage pool being unhealthy: -
Job ID of the Currently Running Operation: -

Is Allocation Unit Broken?: false
```

storage pool show-aggregate

Display aggregates provisioned from storage pools

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage pool show-aggregate` command displays allocation information for SSD storage pools in the cluster. The command output depends upon the parameter or parameters specified with the command. If no parameters are specified, the command displays information about allocations of all storage pools in the cluster.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-storage-pool <storage pool name>] - Name of Storage Pool

Selects the storage pools that match this parameter value.

[-aggregate <aggregate name>] - Aggregate

Selects the storage pools that match this parameter value.

[-capacity {<integer>[KB|MB|GB|TB|PB]}] - Capacity

Selects the storage pools that match this parameter value.

Capacity includes space provided by data and parity portions of each allocation unit. Only the data portions of each allocation unit contribute to the cache or usable capacity of Flash Pool or All-Flash aggregates respectively.

[-allocated-unit-count <integer>] - Number of AU's Assigned to This Aggregate

Selects the storage pools that match this parameter value.

[-original-owner <text>] - Original Owner Name

Selects the storage pools that match this parameter value.

[-node {<nodename>|local}] - Node

Selects the storage pools that match this parameter value.

Examples

Display information about the aggregate or aggregates using a storage pool called *SP2*:

```
cluster1::> storage pool show-aggregate -storage-pool SP2 -instance

      Name of Storage Pool: SP2
      Aggregate: node2_flashpool_1
      Capacity: 744.9GB
Number of AU's Assigned to This Aggregate: 1
      Original Owner Name: node2
      Node: node2
```

storage pool show-available-capacity

Display available capacity of storage pools

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage pool show-available-capacity` command displays information about available capacity in SSD storage pools on each node in the cluster. The command output depends upon the parameter or parameters specified with the command. If no parameters are specified, the command displays information about available capacities in all shared pools in the cluster.

Storage pool available capacity is data storage space that has not yet been provisioned into Flash Pool or All-Flash aggregates. Allocation units might be provisioned into aggregates using the [“storage aggregate add-disks” on page 756](#) command and the `-storage-pool` parameter.

Note: All storage pool available capacity can be provisioned into aggregates. Available capacity within a storage pool is not used to protect against a disk failure. In the case of an SSD failure or predicted failure, Data ONTAP moves a suitable whole SSD spare disk from outside the storage pool into the storage pool and begins the recovery process (using either reconstruction or Rapid RAID Recovery, whichever is appropriate).

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-storage-pool <storage pool name>] - Name of Storage Pool

Selects the available capacities that match this parameter value.

[-node {<nodename>|local}] - Node

Selects the available capacities that match this parameter value.

[-allocation-unit-size {<integer>[KB|MB|GB|TB|PB]] - Allocation Unit Size

Selects the available capacities that match this parameter value.

Allocation units are the units of storage capacity that are available to be provisioned into aggregates.

[-storage-type <SSD>] - Type of Storage Pool

Selects the available capacities that match this parameter value. Only the SSD type is supported for this version of Data ONTAP.

[-allocation-unit-count {<integer>}] - Number of Allocation Units Available

Selects the available capacities that match this parameter value.

Allocation units are the units of storage capacity that are available to be provisioned into aggregates.

Each allocation unit is one minimum unit of allocation (MUA) and its capacity is given as allocation-unit-size.

[-syncmirror-pool <text>] - Syncmirror Pool

Selects the available capacities that match this parameter value.

The SyncMirror pool of an allocation unit must match the SyncMirror pool of the disks of the aggregate when adding allocation units into an aggregate.

Mirroring of aggregates that are provisioned from SSD storage pools is not supported.

[-available-size {<integer>[KB|MB|GB|TB|PB]] - Total Usable Available Size

Selects the available capacities that match this parameter value.

The available-size is the sum of the capacities of the allocation units that are assigned but not yet provisioned. The amount of available-size that is contributed to the cache or usable capacity of an aggregate depends upon the RAID type used when provisioning the allocation units.

Examples

In this example, two nodes of an HA pair share available capacity from two storage pools, *SP1* and *SP2*. There are a total of 5 allocation units that have not yet been provisioned.

```
cluster1::> storage pool show-available-capacity
```

Node	Storage Pool	Storage Type	SyncMirror Pool	Allocation Unit size	Unit Count	Total Usable Size
node-a	SP1	SSD	Pool0	558.7GB	1	558.7GB
node-b	SP1	SSD	Pool0	558.7GB	1	558.7GB
node-a	SP2	SSD	Pool0	744.9GB	2	1.45TB
node-b	SP2	SSD	Pool0	744.9GB	1	744.9GB

storage pool show-disks

Display disks in storage pools

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage pool show-disks` command displays information about disks in storage pools in the cluster. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays information about all disks in all storage pools in the cluster.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-storage-pool <storage pool name>] - Name of Storage Pool

Selects the storage pools that match this parameter value.

[-disk <disk path name>] - Name of the disk

Selects the storage pools with the disks that match this parameter value.

[-disk-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM}] - Disk Type

Selects the storage pools with the disks that match this parameter value. Only the SSD type is supported for this version of Data ONTAP.

[-usable-size {<integer>[KB|MB|GB|TB|PB]] - Disk Usable Size

Selects the storage pools with the disks that match this parameter value.

In this command, usable-size refers to the sum of the capacities of all of the partitions on the disk.

[-total-size {<integer>[KB|MB|GB|TB|PB]] - Total Size

Selects the storage pools with the disks that match this parameter value.

[-node-list <nodename>, ...] - List of Nodes

Selects the storage pools with the disks that are visible to all of the specified nodes.

Examples

Show information about SSDs in a storage pool called SP2.

```
cluster1::> storage pool show-disks -storage-pool SP2
```

Storage Pool Name: SP2

Disk	Storage Type	Usable Size	Total Size
1.0.16	SSD	745.0GB	745.2GB
1.0.18	SSD	745.0GB	745.2GB
1.0.20	SSD	745.0GB	745.2GB
1.0.22	SSD	745.0GB	745.2GB

Storage Port Commands

Manage storage ports

The `storage port` command family manages the storage ports of the cluster. The command set allows you to view the current status of all storage ports. You can also enable, disable, reset, or rescan a given port or reset a device behind a port.

storage port disable

Disable a storage port

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage port disable` command disables a specified storage port.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the node on which the port resides.

-port <text> - Port

Use this parameter to specify the port that needs to be disabled.

[-force [true]] - Force (privilege: advanced)

Use this optional parameter to force the disabling of the storage port. The parameter can be used to disable the specified port even if some devices can only be accessed using this port. Note that doing so might cause multiple device failures.

Examples

The following example disables port 0a on node node1:

```
cluster1::> storage port disable -node node1 -port 0a
```

storage port enable

Enable a storage port

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage port enable` command enables a specified storage port.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the node on which the port resides.

-port <text> - Port

Use this parameter to specify the port that needs to be enabled.

Examples

The following example enables port 0a on node node1:

```
cluster1::> storage port enable -node node1 -port 0a
```

storage port rescan

Rescan a storage port

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage port rescan` command rescans a specified storage port.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the node on which the port resides.

-port <text> - Port

Use this parameter to specify the port that needs to be rescanned.

Examples

The following example rescans port 0a on node node1:

```
cluster1::> storage port rescan -node node1 -port 0a
```

storage port reset

Reset a storage port

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage port reset` command resets a specified storage port.

Parameters

-node {<nodename>|local} - **Node**

Use this parameter to specify the node on which the port resides.

-port <text> - **Port**

Use this parameter to specify the port that needs to be reset.

Examples

The following example resets port 0a on node node1:

```
cluster1::> storage port reset -node node1 -port 0a
```

storage port reset-device

Reset a device behind a storage port

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage port reset-device` command resets a device behind a port. If the device is behind a SAS port, you need to specify the shelf name and bay ID where the device resides. If the device is behind a FC port, you need to specify the loop ID of the device.

Parameters

-node {<nodename>|local} - **Node**

Use this parameter to specify the node on which the port resides.

-port <text> - **Port**

Use this parameter to specify the port used to reset the device.

{ **-shelf-name** <text> - **Shelf Name**

Use this parameter to specify the shelf where the device resides.

-bay-id <integer> - **Bay ID**

Use this parameter to specify the bay where the device resides.

| **-loop-id** <integer>} - **Loop ID**

Use this parameter to specify the loop ID of the device.

Examples

The following example resets a device behind SAS port 0a on node node1:

```
cluster1::> storage port reset-device -node node1 -port 0a -shelf-name 1.0 -bay-id 10
```

The following example resets a device behind FC port 1b on node node1:

```
cluster1::> storage port reset-device -node node1 -port 1b -loop-id 20
```

storage port show

Show storage port information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage port show` command displays information about the storage ports in the cluster. If no parameters are specified, the default command displays the following information about the storage ports:

- Node
- Port
- Type
- Speed
- State
- Status

To display detailed profile information about a single storage port, use the `-node` and `-port` parameters.

Parameters

{ [-fields <fieldname>, ...]

Displays the specified fields for all the storage ports, in column style output.

| [-errors]

Displays the following error status information about the storage ports which have errors:

- Error type
- Error severity
- Error description

| [-instance]

Displays expanded information about all the storage ports in the system. If a storage port is specified, then this parameter displays detailed information for that port only.

[-node {<nodename>|local}] - Node

Displays detailed information about the storage ports on the specified node.

[-port <text>] - Port

Selects the ports with the specified port name.

[-port-type {Unknown|SAS|FC}] - Port Type

Selects the ports of the specified type.

[-port-speed {0|1|1.5|2|3|4|6|8|10|12|16|32}] - Port Speed

Selects the ports with the specified speed.

[-state {enabled|disabled}] - Port State

Selects the ports with the specified state.

[-status {unknown|online|online-degraded|offline|link-down}] - Port Status

Selects the ports with the specified operational status.

[-description <text>] - Description

Selects the ports with the specified description.

[-firmware-rev <text>] - Firmware Revision

Selects the ports with the specified firmware revision.

[-serial-number <text>] - Serial Number

Selects the ports with the specified serial number.

[-connection-mode {Unknown|Loop|Point-to-point}] - Connection Mode

Selects the ports with the specified connection mode.

[-wwnn <FC WWN>] - World Wide Node Name

Selects the ports with the specified World Wide Node Name.

[-wwpn <FC WWN>] - World Wide Port Name

Selects the ports with the specified World Wide Port Name.

[-board-name <text>] - Board Name

Selects the ports with the specified board name.

[-connector-capabilities <integer>, ...] - Connector Capabilities

Selects the ports with the specified list of connector capabilities.

[-wwn <FC WWN>] - Base World Wide Name

Selects the ports with the specified World Wide Name.

[-mfg-part-number <text>] - MFG Part Number

Selects the ports with the specified manufacturer part number.

[-nvdata-rev <text>] - NVDATA Revision

Selects the ports with the specified NVDATA revision.

[-part-number <text>] - Part Number

Selects the ports with the specified part number.

[-date-code <text>] - Date Code

Selects the ports with the specified date code.

[-cable-length <text>] - Cable Length

Selects the ports with the specified cable length.

[-cable-identifier <text>] - Cable Identifier

Selects the ports with the specified cable identifier.

[-cable-end-id {end_0|end_1}] - Cable End Identifier

Selects the ports with the specified cable end identifier.

[-connector-technology {active-copper|passive-copper|optical}] - Connector Technology

Selects the ports with the specified connector technology.

[-phy-id <integer>, ...] - Phy ID

Selects the ports that have phys with the specified phy ID.

[-phy-state {enabled|disabled}, ...] - Phy State

Selects the ports that have phys with the specified state.

[-phy-status {unknown|online|offline|speed-negotiation-failed|sata-oob-failed}, ...] - Phy Status

Selects the ports that have phys with the specified status.

[-phy-speed {0|1|1.5|2|3|4|6|8|10|12|16|32}, ...] - Phy Speed

Selects the ports that have phys with the specified speed.

[-error-type {unknown|online|online-degraded|offline|link-down}] - Error Type
Selects the ports with the specified error type.

[-error-severity {unknown|notice|warning|error|critical}] - Error Severity
Selects the ports with the specified error severity.

[-error-text <text>] - Error Text
Selects the ports with the specified error text.

[-corrective-action <text>] - Corrective Action
Selects the ports with the specified corrective action.

[-connector-type {QSFP|QSFP+|Mini-SAS HD|SFP}] - Connector Type
Selects the ports with the specified connector type.

[-connector-vendor <text>] - Connector Vendor
Selects the ports with the specified connector vendor.

[-connector-part-number <text>] - Connector Part Number
Selects the ports with the specified connector part number.

[-connector-serial-number <text>] - Connector Serial Number
Selects the ports with the specified connector serial number.

Examples

The following example displays information about all storage ports in the cluster:

```
cluster1::> storage port show
```

Node	Port	Type	Speed (Gb/s)	State	Status
node1					
	0a	SAS	0	disabled	offline
	0b	SAS	6	enabled	online
	1a	FC	0	disabled	offline
	1b	FC	2	enabled	online
node2					
	0a	SAS	6	enabled	online
	0b	SAS	6	enabled	online-degraded
	1a	FC	2	enabled	online
	1b	FC	2	enabled	online

The following example displays detailed information about port 0a on node node1:

```
cluster1::> storage port show -node node1 -port 0b
```

```
Node: node1
Port: 0b
Description: SAS Host Adapter 0b (PMC-Sierra PM8001 rev. C)
Firmware Revision: 01.12.06.00
Base WWN: 50:0a:09:80:00:82:47:b4
Connector Type: qsfp
Connector Vendor: Molex Inc.
Connector Part Number: 112-00177+A0
Connector Technology: passive_copper
Connector Serial Number: 017920547
Cable Length: 2m
Cable End Identifier: end_1
Cable Identifier: 500a09800082847f-500a0980008247b4
Port Speed: 6 Gb/s
Port State: enabled
Port Status: online
Phy State: [0] enabled, online, 6 Gb/s
           [1] enabled, online, 6 Gb/s
           [2] enabled, online, 6 Gb/s
           [3] enabled, online, 6 Gb/s
```

Storage raid-options Commands

The raid-options directory

The sub commands “[storage raid-options modify](#)” on page 978 and “[storage raid-options show](#)” on page 978 are used to change and view the configurable node RAID options. Following are the RAID options that can be configured:

`raid.background_disk_fw_update.enable`

This option determines the behavior of automatic disk firmware update. Valid values are *on* or *off*. The default value is *on*. If the option is set to *on*, firmware updates to spares and file-system disks are performed in a non-disruptive manner in the background. If the option is turned *off* automatic firmware update occur when the system is booted or a disk is inserted.

`raid.disk.copy.auto.enable`

This option determines the action taken when a disk reports a predictive failure. Valid values for this option are *on* or *off*. The default value for this option is *on*.

Sometimes, it is possible to predict that a disk will fail soon based on a pattern of recovered errors that have occurred on the disk. In such cases, the disk reports a predictive failure to Data ONTAP. If this option is set to *on*, Data ONTAP initiates Rapid RAID Recovery to copy data from the failing disk to a spare disk. When data is copied, the disk is marked failed and placed in the pool of broken disks. If a spare is not available, the node will continue to use the prefailed disk until the disk fails.

If the option is set to *off*, the disk is immediately marked as failed and placed in the pool of broken disks. A spare disk is selected and data from the missing disk is reconstructed from other disks in the RAID group. The disk does not fail if the RAID group is already degraded or is being reconstructed. This ensures that a disk failure does not lead to the failure of the entire RAID group.

`raid.disktype.enable`

This option is obsolete. Use options `raid.mix.hdd.disktype.capacity` and `raid.mix.hdd.disktype.performance` instead.

`raid.media_scrub.rate`

This option sets the rate of media scrub on an aggregate. Valid values for this option range from 300 to 3000 where a rate of 300 represents a media scrub of approximately 512 MB per hour, and 3000 represents a media scrub of approximately 5GB per hour. The default value for this option is 600, which is a rate of approximately 1GB per hour.

`raid.min_spare_count`

This option specifies the minimum number of spare drives required to avoid warnings about low spare drives. If every file-system drive has the minimum number of spare drives specified in `raid.min_spare_count` that are appropriate replacements, then no warning is displayed for low spares. This option can be set from 0 to 4. The default setting is 1. Setting this option to 0 means that no warnings will be displayed for low spares even if there are no spares available. This option can be set to 0 only on systems that have 16 or fewer attached drives and that are running with RAID-DP aggregates. A setting of 0 is not allowed on systems with RAID4 aggregates.

`raid.mirror_read_plex_pref`

This option specifies the plex preference when reading from a mirrored aggregate on a MetroCluster-configured system. There are three possible values:

- *local* indicates that all reads are handled by the local plex (plex consisting of disks from Pool0).
- *remote* indicates that all reads are handled by the remote plex (plex consisting of disks from Pool1).
- *alternate* indicates that the handling of read requests is shared between the two plexes.

This option is ignored if the system is not in a MetroCluster configuration. The option setting applies to all aggregates on the node.

`raid.mix.hdd.disktype.capacity`

Controls mixing of SATA, BSAS, FSAS and ATA disk types. The default value is *on*, which allows mixing.

When this option is set to *on*, SATA, BSAS, FSAS and ATA disk types are considered interchangeable for all aggregate operations, including aggregate creation, adding disks to an aggregate, and replacing disks within an existing aggregate, whether this is done by the administrator or automatically by Data ONTAP.

If you set this option to *off*, SATA, BSAS, FSAS and ATA disks cannot be combined within the same aggregate. If you have existing aggregates that combine those disk types, those aggregates will continue to function normally and accept any of those disk types.

Note: This option is ignored in [“storage aggregate create” on page 760](#) and [“storage aggregate add-disks” on page 756](#) commands, when either of `-disktype` or `-diskclass` parameters are used. It is better to use the `-disktype` or `-diskclass` parameter instead of relying on this option.

`raid.mix.hdd.disktype.performance`

Controls mixing of FCAL and SAS disk types. The default value is *off*, which prevents mixing.

If you set this option to *on*, FCAL and SAS disk types are considered interchangeable for all aggregate operations, including aggregate creation, adding disks to an aggregate, and replacing disks within an existing aggregate, whether this is done by the administrator or automatically by Data ONTAP.

When this option is set to *off*, FCAL and SAS disks cannot be combined within the same aggregate. If you have existing aggregates that combine those disk types, those aggregates will continue to function normally and accept either disk type.

Note: This option is ignored in [“storage aggregate create” on page 760](#) and [“storage aggregate add-disks” on page 756](#) commands, when either of `-disktype` or `-diskclass` parameter is used. It is better to use the `-disktype` or `-diskclass` parameter instead of relying on this option.

`raid.mix.disktype.solid_state`

Controls mixing of SSD and SSD-NVM disk types. The default value is *on*, which allows mixing.

If you set this option to *on*, SSD and SSD-NVM disk types are considered interchangeable for all aggregate operations, including aggregate creation, adding disks to an aggregate, and replacing disks within an existing aggregate, whether this is done by the administrator or automatically by Data ONTAP.

When this option is set to *off*, SSD and SSD-NVM disks cannot be combined within the same aggregate. If you have existing aggregates that combine those disk types, those aggregates will continue to function normally and accept either disk type.

Note: This option is ignored in “[storage aggregate create](#)” on page 760 and “[storage aggregate add-disks](#)” on page 756 commands, when either of `-disktype` or `-diskclass` parameter is used. It is better to use the `-disktype` or `-diskclass` parameter instead of relying on this option.

`raid.mix.hdd.rpm.capacity`

This option controls separation of capacity-based hard disk drives (ATA, SATA, BSAS, FSAS, MSATA) by uniform rotational speed (RPM). If you set this option to *off*, Data ONTAP always selects disks with the same RPM when creating new aggregates or when adding disks to existing aggregates using these disk types. If you set this option to *on*, Data ONTAP does not differentiate between these disk types based on rotational speed. For example, Data ONTAP might use both 5400 RPM and 7200 RPM disks in the same aggregate. The default value is *on*.

`raid.mix.hdd.rpm.performance`

This option controls separation of performance-based hard disk drives (SAS, FCAL) by uniform rotational speed (RPM). If you set this option to *off*, Data ONTAP always selects disks with the same RPM when creating new aggregates or when adding disks to existing aggregates using these disk types. If you set this option to *on*, Data ONTAP does not differentiate between these disk types based on rotational speed. For example, Data ONTAP might use both 10K RPM and 15K RPM disks in the same aggregate. The default value is *off*.

`raid.reconstruct.perf_impact`

This option sets the overall performance impact of RAID reconstruction. When the CPU and disk bandwidth are not consumed by serving clients, RAID reconstruction consumes as much bandwidth as it needs. If the serving of clients is already consuming most or all of the CPU and disk bandwidth, this option allows control over the CPU and disk bandwidth that can be taken away for reconstruction, and thereby enables control over the negative performance impact on the serving of clients. As the value of this option is increased, the speed of reconstruction also increase. The possible values *low*, *medium*, and *high*. The default value is *medium*. When mirror resync and reconstruction are running at the same time, the system does not distinguish between their separate resource consumption on shared resources (like CPU or a shared disk). In this case, the combined resource utilization of these operations is limited to the maximum resource entitlement for individual operations.

`raid.resync.num_concurrent_ios_per_rg`

This option changes the duration of a resync by modifying the number of concurrent resync I/Os in progress for each resync'ing raidgroup. The legacy, and default value, is *1*. As the value of this option is increased, the speed of resync is increased. This will have a negative performance impact on the serving of clients.

`raid.resync.perf_impact`

This option sets the overall performance impact of RAID mirror resync (whether started automatically by the system or implicitly by an operator-issued command). When the CPU and disk bandwidth are not consumed by serving clients, a resync operation consumes as much bandwidth as it needs. If the serving of clients is already consuming most or all of the CPU and disk bandwidth, this option allows control over the CPU and disk bandwidth that can be taken away for resync operations, and thereby enables control over the negative performance impact on the serving of clients. As the value of this option is increased, the speed of resync also increases. The possible values are *low*, *medium*, and *high*. The default value is *medium*. When RAID mirror resync and reconstruction are running at the same time, the system does not distinguish between their separate resource consumption on shared resources (like CPU or a shared disk). In this case, the combined resource utilization of these operations is limited to the maximum resource entitlement for individual operations.

`raid.rpm.ata.enable`

This option is obsolete. Use option `raid.mix.hdd.rpm.capacity` instead.

`raid.rpm.fcal.enable`

This option is obsolete. Use option `raid.mix.hdd.rpm.performance` instead.

`raid.scrub.perf_impact`

This option sets the overall performance impact of RAID scrubbing (whether started automatically or manually). When the CPU and disk bandwidth are not consumed by serving clients, scrubbing consumes as much bandwidth as it needs. If the serving of clients is already consuming most or all of the CPU and disk bandwidth, this option allows control over the CPU and disk bandwidth that can be taken away for scrubbing, and thereby enables control over the negative performance impact on the serving of clients. As the value of this option is increased, the speed of scrubbing also increases. The possible values for this option are *low*, *medium*, and *high*. The default value is *low*. When scrub and mirror verify are running at the same time, the system does not distinguish between their separate resource consumption on shared resources (like CPU or a shared disk). In this case, the combined resource utilization of these operations is limited to the maximum resource entitlement for individual operations.

`raid.scrub.schedule`

This option specifies the weekly schedule (day, time and duration) for scrubs started automatically. On a non-AFF system, the default schedule is daily at 1 a.m. for the duration of 4 hours except on Sunday when it is 12 hours. On an AFF system, the default schedule is weekly at 1 a.m. on Sunday for the duration of 6 hours. If an empty string ("") is specified as an argument, it will delete the previous scrub schedule and add the default schedule. One or more schedules can be specified using this option. The syntax is `duration[h|m]@weekday@start_time,[duration[h|m]@weekday@start_time,...]` where duration is the time period for which scrub operation is allowed to run, in hours or minutes ('h' or 'm' respectively).

Weekday is the day on which the scrub is scheduled to start. The valid values are `sun`, `mon`, `tue`, `wed`, `thu`, `fri`, `sat`.

`start_time` is the time when scrub is schedule to start. It is specified in 24 hour format. Only the hour (0-23) needs to be specified.

For example, options `raid.scrub.schedule 240m@tue@2,8h@sat@22` will cause scrub to start on every Tuesday at 2 a.m. for 240 minutes, and on every Saturday at 10 p.m. for 480 minutes.

`raid.timeout`

This option sets the time, in hours, that the system will run after a single disk failure in a RAID4 group or a two disk failure in a RAID-DP group has caused the system to go into degraded mode or double degraded mode respectively, or after NVRAM battery failure has occurred. The default is 24, the minimum acceptable value is 0 and the largest acceptable value is 4,294,967,295. If the `raid.timeout` option is specified when the system is in degraded mode or in double degraded mode, the timeout is set to the value specified and the timeout is restarted. If the value specified is 0, automatic system shutdown is disabled.

`raid.verify.perf_impact`

This option sets the overall performance impact of RAID mirror verify. When the CPU and disk bandwidth are not consumed by serving clients, a verify operation consumes as much bandwidth as it needs. If the serving of clients is already consuming most or all of the CPU and disk bandwidth, this option allows control over the CPU and disk bandwidth that can be taken away for verify, and thereby enables control over the negative performance impact on the serving of clients. As you increase the value of this option, the verify speed also increases. The possible values are *low*, *medium*, and *high*. The default value is *low*. When scrub and mirror

verify are running at the same time, the system does not distinguish between their separate resource consumption on shared resources (like CPU or a shared disk). In this case, the combined resource utilization of these operations is limited to the maximum resource entitlement for individual operations.

storage raid-options modify

Modify a RAID option

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage raid-options modify` command is used to modify the available RAID options for each node in a cluster. The options are described in the [“storage raid-options” on page 974](#) manual page.

Parameters

-node {<nodename>|local} - Node

This parameter specifies the node on which the RAID option is to be modified.

-name <text> - Option Name

This parameter specifies the RAID option to be modified. To see the list of RAID options that can be modified, use the [“storage raid-options show” on page 978](#) command.

[-value <text>] - Option Value

This parameter specifies the value of the selected RAID option.

storage raid-options show

Display RAID options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage raid-options show` command displays information about all the RAID options in a cluster. The options are described in the [“storage raid-options” on page 974](#) manual page.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects information about all the RAID options on the specified node.

[-name <text>] - Option Name

Selects information about the RAID options that have the specified name.

[-value <text>] - Option Value

Selects information about all the RAID options that have the specified value.

[-constraint <text>] - Option Constraint

Selects information about all the RAID options that have the specified constraint. The 'constraint' field indicates the expected setting for a RAID option across both nodes of an HA pair. The possible values are:

- *none* - no constraint on the value of this RAID option; nodes can have different values

- *same_preferred* - the same value should be used on both nodes of an HA pair, otherwise the next takeover may not function correctly
- *same_required* - the same value must be used on both nodes of an HA pair, otherwise the next takeover will not function correctly
- *only_one* - the same value should be used on both nodes of an HA pair. If the values are different and a takeover is in progress, the value of the RAID option on the node that is taking over will be used
- *unknown* - no information about constraints for this RAID option

Examples

The following example shows the raid scrub settings for a node named node1:

```
cluster1::> storage raid-options show -node node1 -name raid.scrub*
Node      Option                               Value      Constraint
-----
node1     raid.scrub.perf_impact               low        only_one
node1     raid.scrub.schedule                 none
3 entries were displayed.
```

storage shelf commands

Manage storage shelves

storage shelf show

Display a list of storage shelves

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage shelf show` command displays information about all the storage shelves in the storage system. If no parameters are specified, the default command displays the following information about the storage shelves:

- Shelf Name
- Shelf ID
- Serial Number
- Model
- Module Type
- Status

To display detailed profile information about a single storage shelf, use the `-shelf` parameter.

Parameters

{ **[-fields** <fieldname>, ...]

Displays the specified fields for all the storage shelves, in column style output.

| **[-bay]**

Displays the following details about the disk bays in the storage shelf:

- The unique positional identifier of the disk bay
- Whether a disk drive is installed in the bay
- Bay type
- Operational status of the disk bay

| [-connectivity]

Displays the following details about the connectivity from the node to the storage shelf:

- Node name
- Initiator side switch port
- Target side switch port
- World wide port name
- Target Port Group Number (TPGN)

| [-cooling]

Displays the following details about the cooling elements and temperature sensors of the storage shelf:

- Element ID of the cooling fan
- The current speed of the cooling fan in revolutions per minute (rpm)
- Operational status of the cooling fan
- Sensor ID of the temperature sensor element
- Temperature at the sensor in degrees Celsius
- Whether the current temperature at the sensor is the ambient temperature
- Low critical threshold value for the temperature sensor
- Low warning threshold value for the temperature sensor
- High critical threshold value for the temperature sensor
- High warning threshold value for the temperature sensor
- Operational status for the temperature sensor

| [-errors]

Displays the following error status information about the storage shelves which have errors:

- Error type
- Error description

| [-module]

Displays the following details about the I/O modules attached to the storage shelf:

- Module ID
- Module Part number
- Serial number of the Enclosure Services Controller Electronics element
- Whether monitoring is enabled on this module
- Whether this module is the SAS expander master module
- Whether this module is the element reporting
- Version of the firmware installed on the module
- Latest firmware revision
- Number of times, since last boot, that this module has been swapped
- Operational status of the module

| [-port]

Displays the following details about the storage shelf ports:

- Expander phy element identifier
- SAS shelf port type
- World Wide Port Name of the SAS port

- Operational physical link rate of the SAS port in Gb/s
- Negotiated physical link rate of the SAS port in Gb/s
- Power status of the SAS port
- Status of the SAS port
- Fibre Channel shelf port ID
- Fibre Channel shelf port type
- Fibre Channel shelf port status

| [-power]

Displays the following details about the power supplies, voltage sensors and current sensors of the storage shelf:

- Power Supply Unit (PSU) number
- PSU type
- PSU part number
- PSU serial number
- PSU power rating in watts
- PSU crest factor
- Power drawn from the PSU in watts
- Whether the PSU can be reset via software control
- Whether the auto power reset of the PSU is enabled
- PSU firmware revision
- Operational status of the PSU
- Voltage sensor number
- Voltage detected by the voltage sensor, in volts (V)
- Operational status of the voltage sensor
- Current sensor number
- Current detected by the current sensor, in milliamps (mA)
- Operational status of the current sensor

| [-instance]

Displays expanded information about all the storage shelves in the system.

[-node {<nodename>|local}] - Node

Displays information only about the storage shelves that are attached to the node you specify.

[-shelf <text>] - Shelf Name

Displays information only about the storage shelves that match the names you specify.

[-shelf-uid <text>] - Shelf UID

Displays information only about the storage shelf that matches the shelf UID you specify. Example:
50:05:0c:c0:02:10:64:26

[-stack-id {<integer>|-}] - Stack ID

Displays information only about the storage shelves that are attached to the stack that matches the stack ID you specify

[-shelf-id <text>] - Shelf ID

Displays information only about the storage shelves that match the shelf ID you specify.

[-module-type {unknown|atfcx|esh4|iom3|iom6|iom6e|iom12|iom12e|iom12f|psm3e}] - Shelf Module Type

Displays information only about the storage shelves that match the module-type you specify.

[-connection-type {unknown|fc|sas|nvme}] - Shelf Connection Type

Displays information only about the storage shelves that match the connection type you specify.

Example: FC or SAS.

[-is-local-attach {true|false}] - Is the Shelf Local to This Cluster?

Displays information only about the storage shelves that are local (TRUE) or remote (FALSE) to this cluster.

[-vendor <text>] - Shelf Vendor

Displays information only about the storage shelves that match the vendor you specify.

[-product-id <text>] - Shelf Product Identification

Displays information only about the storage shelves that match the product ID you specify.

[-serial-number <text>] - Shelf Serial Number

Displays information only about the storage shelf that matches the serial number you specify.

[-disk-count {<integer>|-}] - Disk Count

Displays information only about the storage shelves that have the disk count you specify.

[-state {unknown|no-status|init-required|online|offline|missing}] - Shelf State

Displays information only about the storage shelves that are in the state you specify.

[-op-status {unknown|normal|warning|error|critical|standby-power}] - Shelf Operational Status

Displays information only about the storage shelves that are currently operating under the status condition you specify.

[-bay-id {<integer>|-}, ...] - Bay ID

Displays information only about the storage shelves that have bays that match the bay ID you specify.

[-bay-type {unknown|single-disk|multi-lun}, ...] - Bay Type

Displays information only about the storage shelves that have bays that match the type of bay you specify.

[-bay-has-disk {true|false}, ...] - Bay Has Disk

Displays information only about the storage shelves that have bays with disk drives inserted in them (true) or empty bays (false).

[-bay-op-status {unknown|normal|error}, ...] - Bay Operational Status

Displays information only about the storage shelves that have bays that match the operational state you specify.

[-controller {<nodename>|local}, ...] - Controller Name

Displays information only about the storage shelves that are connected to the node you specify.

[-controller-uuid <text>, ...] - Controller UUID

Displays information only about the storage shelves that are connected to the node UUID you specify.

[-initiator <text>, ...] - Initiator

Displays information only about the storage shelves that are visible to the initiator you specify.

[-initiator-wwpn <text>, ...] - Initiator WWPN

Displays information only about the storage shelves that are visible to the initiator WWPN you specify.

[-initiator-side-switch-port <text>, ...] - Initiator Side Switch Port

Displays information only about the storage shelves that are visible to an initiator connected to the switch port you specify.

[-target-side-switch-port <text>, ...] - Target Side Switch Port

Displays information only about the storage shelves visible on target ports identified by the switch port to which they are connected.

[-target-port <text>, ...] - Target Port

Displays information only about the storage shelves visible on the specified target ports identified by their World Wide Port Name (WWPN).

[-tpgn {<integer>|-}, ...] - Target Port Group Number

Displays information only about the storage shelves that belong to the Target Port Group Name (TPGN) you specify.

[-port-speed {<integer>|-}, ...] - Port Speed

Displays information only about the storage shelves with ports that match the port speed you specify.

[-io-kbps {<integer>|-}, ...] - Kbytes/sec on Storage Shelf

Displays information only about the storage shelves visible to an initiator that has executed I/O at the throughput you specify.

[-iops {<integer>|-}, ...] - Number IOPS per Second on Storage Shelf

Displays information only about the storage shelves visible to an initiator that has executed the number of IOPs you specify.

[-current-sensor-id {<integer>|-}, ...] - Current Sensor ID

Displays information only about the storage shelves with current sensor that matches the current sensor ID you specify.

[-current-sensor-location <text>, ...] - Current Sensor Location

Displays information only about the storage shelves with current sensors installed at the location you specify.

[-current-sensor-reading {<integer>|-}, ...] - Current Sensor Reading

Displays information only about the storage shelves with current sensors that match the current reading you specify.

[-current-op-status {unknown|normal|over-current-critical|under-current-critical|not-supported|not-installed}, ...] - Operational Status

Displays information only about the storage shelves with current sensors that match the operational status you specify.

[-fan-id {<integer>|-}, ...] - Fan ID

Displays information only about the storage shelves with a cooling fans that match the fan IDs you specify.

[-fan-location <text>, ...] - Fan Location

Displays information only about the storage shelves with cooling fans installed.

[-fan-rpm {<integer>|-}, ...] - Fan Rotation Per Minute

Displays information only about the storage shelves with cooling fans that match the rpm you specify.

[-fan-op-status {unknown|normal|off|error|not-supported|not-installed}, ...] - Fan Operational Status

Displays information only about the storage shelves with cooling fans that match the operational status you specify.

[-module-id <text>, ...] - Module ID

Displays information only about the storage shelves with an I/O module that matches the module ID you specify.

[-module-location <text>, ...] - Module Location

Displays information only about the storage shelves with I/O modules in the specified shelf module slots.

[-module-part-number <text>, ...] - Module Part Number

Displays information only about the storage shelves with I/O modules that match the module part numbers you specify.

[-is-sas-master-module {true|false}, ...] - Is SAS Expander Master Module?

Displays information only about the storage shelves with a SAS master I/O module (true) or an I/O module that is not a SAS master (false). This parameter applies only to SAS shelves.

[-is-monitor-active {true|false}, ...] - Is Monitor Active?

Displays information only about the storage shelves whose monitoring is enabled (true) or disabled (false).

[-enclosure-type <text>, ...] - Module Enclosure Type

Displays information only about the storage shelves that match the enclosure types you specify.

[-es-serial-number <text>, ...] - ES Electronics Element Serial Number

Displays information only about the storage shelves with I/O modules that match the electronics serial numbers you specify.

[-module-fru-id <text>, ...] - Field Replaceable Unit ID

Displays information only about the storage shelves with I/O modules that match the field replaceable unit (FRU) IDs you specify.

[-module-is-reporting-element {true|false}, ...] - Is Reporting Element?

Displays information only about the storage shelves with element reporting I/O modules (true) or not (false).

[-module-fw-revision <text>, ...] - Firmware Revision

Displays information only about the storage shelves with I/O modules that match the firmware revision you specify.

[-module-latest-fw-revision <text>, ...] - Latest Firmware Revision

Displays information only about the storage shelves with I/O modules that match the latest firmware revision you specify.

[-module-fw-progress {not-available|ready|in-progress|failed}, ...] - Module Firmware Progress

Displays information only about the storage shelves with I/O modules that match the specified firmware update progress.

[-module-swap-count {<integer>|-}, ...] - Module Swap Count

Displays information only about the storage shelves whose I/O modules have been swapped the specified number of times.

[-module-op-status {unknown|normal|warning|error}, ...] - Module Operational Status

Displays information only about the storage shelves with I/O modules that match the operational status you specify.

[-sas-port-id <text>, ...] - Port ID

Displays information only about the storage shelves with SAS Ports that match the port IDs you specify.

[-sas-port-type {unknown|circle|square|sil|disk|in|out|unused|host|dcm|aux1|aux2|hi_ho|a_to_b|b_to_a}, ...] - Port Type

Displays information only about the storage shelves with SAS Ports that match the SAS port type you specify.

[-sas-port-wwpn <text>, ...] - Port World Wide Port Name

Displays information only about the storage shelves with SAS Ports that match the World Wide Port Names you specify.

[-sas-port-speed <text>, ...] - Port Speed

Displays information only about the storage shelves with SAS Ports that match the port speed you specify.

[-sas-negotiated-port-speed <text>, ...] - Negotiated Port Speed

Displays information only about the storage shelves with SAS Ports that match the negotiated port speed you specify.

[-sas-port-power-status <text>, ...] - Port Power Status

Displays information only about the storage shelves with SAS Ports that match the power status you specify.

[-sas-port-op-status {error|normal|off|unknown|byp-bad-term|bad-zone-recovery|byp_clk_thr|byp_comma_los|byp_crc_brst_thr|byp_data_timeout|byp_drv_fault|byp_drv_pcycle|byp_drv_pwr|byp_drv_self|byp_gen|byp_init|byp_lip_brst_thr|byp_lip_f8|byp_lip_rate_thr|byp_lipf7|byp_ltb|byp_man|byp_no_drive|byp_osc|byp_other_thr|byp_rec_los|byp_rport|byp_stall_thr|byp_wrd_brst_thr|byp_wrd_rate_thr|byp_xmit_fault|diag_transmit|inserted|loopback|status_unknown|warn_high_clk_delta|warn_high_crc_rate|warn_high_lip|warn_high_wrd_rate|term|phy_dis_clk_fault|phy_dis_crc_err|phy_dis_crc_err_burst|phy_dis_disparity|phy_dis_disparity_burst|phy_dis_emulate_reserve|phy_dis_inval_dword|phy_dis_inval_dword_burst|phy_dis_loss_dword|phy_dis_loss_dword_burst|phy_dis_man_smp|phy_dis_manual|phy_dis_mirrored|empty|phy_dis_phy_change|phy_dis_phy_change_burst|phy_dis_phy_reset|phy_dis_phy_reset_burst|phy_dis_phy_unused|phy_ena|phy_ena_not_attach|phy_ena_unknown|phy_unknown}, ...] - Port Operational Status

Displays information only about the storage shelves with SAS Ports that match the operational status you specify. Displays information only about the storage shelves with SAS Ports that match the operational status you specify.

[-sas-port-module-id {A|B}, ...] - Port Module ID

Displays information only about the storage shelves with SAS Ports that match the module ID you specify.

[-fc-port-id <text>, ...] - Fibre Channel Port ID

Displays information only about the storage shelves with FC Ports that match the port IDs you specify.

[-fc-port-mode {unknown|circle|square|sil|disk|in|out|unused|host|dcm|aux1|aux2|hi_ho|a_to_b|b_to_a}, ...] - Fibre Channel Port Mode

Displays information only about the storage shelves with FC Ports that match the port modes you specify.

[-fc-port-op-status {error|normal|off|unknown|byp-bad-term|bad-zone-recovery|byp_clk_thr|byp_comma_los|byp_crc_brst_thr|byp_data_timeout|byp_drv_fault|byp_drv_pcycle|byp_drv_pwr|byp_drv_self|byp_gen|byp_init|byp_lip_brst_thr|byp_lip_f8|byp_lip_rate_thr|byp_lipf7|byp_ltb|byp_man|byp_no_drive|byp_osc|byp_other_thr|byp_rec_los|byp_rport|byp_stall_thr|byp_wrd_brst_thr|byp_wrd_rate_thr|byp_xmit_fault|diag_transmit|inserted|loopback|status_unknown|warn_high_clk_delta|warn_high_crc_rate|warn_high_lip|warn_high_wrd_rate|term|phy_dis_clk_fault|phy_dis_crc_err|phy_dis_crc_err_burst|phy_dis_disparity|phy_dis_disparity_burst|phy_dis_emulate_reserve|phy_dis_inval_dword|phy_dis_inval_dword_burst|phy_dis_loss_dword|phy_dis_loss_dword_burst|phy_dis_man_smp|phy_dis_manual|phy_dis_mirrored|empty|phy_dis_phy_change|phy_dis_phy_change_burst|phy_dis_phy_reset|phy_dis_phy_reset_burst|phy_dis_phy_unused|phy_ena|phy_ena_not_attach|phy_ena_unknown|phy_unknown}, ...] - Fibre Channel Port Operational Status

Displays information only about the storage shelves with FC Ports that match the operational status you specify.

[-psu-id {<integer>|-}, ...] - Power Supply Unit ID

Displays information only about the storage shelves with power supply units (PSU) that match the unit IDs you specify.

[-psu-location <text>, ...] - Power Supply Unit Location

Displays information only about the storage shelves with PSUs that are located at the specified location inside the shelf.

[-psu-type <text>, ...] - Power Supply Unit Type

Displays information only about the storage shelves with PSUs that match the PSU types you specify.

[-psu-part-number <text>, ...] - Power Supply Unit Part Number

Displays information only about the storage shelves with PSUs that match the PSU part number you specify.

[-psu-serial-number <text>, ...] - Power Supply Unit Serial Number

Displays information only about the storage shelves with PSUs that match the PSU serial numbers you specify.

[-psu-reset-capable {true|false}, ...] - Power Supply Unit Reset Capability

Displays information only about the storage shelves with reset capable PSUs (true) or reset incapable PSUs (false).

[-psu-is-enabled {true|false}, ...] - Power Supply Unit Enable/Disable Status

Displays information only about the storage shelves with PSUs that are enabled (true) or disabled (false).

[-psu-fw-version <text>, ...] - Power Supply Unit Firmware Version

Displays information only about the storage shelves with PSUs that have the firmware version you specify.

[-psu-op-status {unknown|normal|error|dc-over-voltage|dc-under-voltage|dc-over-current|over-temperature-error|failed|off|not-supported|not-installed}, ...] - Operational Status

Displays information only about the storage shelves with PSUs that match the operational status you specify.

[-psu-power-rating {<integer>|-}, ...] - Power Supply Power Ratings In Watts

Displays information only about the storage shelves with PSUs that match the power rating you specify.

[-psu-crest-factor {<integer>|-}, ...] - Power Supply Crest Factor

Displays information only about the storage shelves with PSUs that match the crest factor value you specify.

[-psu-power-drawn {<integer>|-}, ...] - Power Drawn From PSU In Watts

Displays information only about the storage shelves with PSUs that match the drawn power you specify.

[-temp-sensor-id {<integer>|-}, ...] - Sensor Name

Displays information only about the storage shelves with temperature sensors that match the sensor IDs you specify.

[-temp-sensor-location <text>, ...] - Sensor Location

Displays information only about the storage shelves with temperature sensors that match the specified sensor locations inside the shelf.

[-temp-sensor-reading {<integer>|-}, ...] - Temperature Reading

Displays information only about the storage shelves with temperature sensors that match the temperature reading you specify.

[-temp-is-ambient {true|false}, ...] - Temperature Reading at Ambient Value

Displays information only about the storage shelves with temperature sensors whose current temperature reading is ambient (true) or not (false).

[-temp-high-critical-threshold {<integer>|-}, ...] - High Critical Threshold

Displays information only about the storage shelves with temperature sensors that match the high critical threshold you specify.

[-temp-high-warning-threshold {<integer>|-}, ...] - High Warning Threshold

Displays information only about the storage shelves with temperature sensors that match the high warning threshold you specify.

[-temp-low-warning-threshold {<integer>|-}, ...] - Low Warning Threshold

Displays information only about the storage shelves with temperature sensors that match the low warning threshold you specify.

[-temp-low-critical-threshold {<integer>|-}, ...] - Low Critical Threshold

Displays information only about the storage shelves with temperature sensors that match the low critical threshold you specify.

[-temp-op-status {unknown|normal|under-temperature|over-temperature|error|not-supported|not-installed}, ...] - Operational Status

Displays information only about the storage shelves with temperature sensors that match the operational status you specify.

[-voltage-sensor-id {<integer>|-}, ...] - Voltage Sensor ID

Displays information only about the storage shelves with voltage sensors that match the sensor IDs you specify.

[-voltage-sensor-location <text>, ...] - Voltage Sensor Location

Displays information only about the storage shelves with voltage sensors that match the specified sensor locations inside the shelf.

[-voltage-sensor-reading <text>, ...] - Voltage Current Reading

Displays information only about the storage shelves with voltage sensors that match the voltage reading you specify.

[-voltage-op-status {unknown|normal|over-voltage-critical|under-voltage-critical|not-supported|not-installed|not-recoverable}, ...] - Operational Status

Displays information only about the storage shelves with voltage sensors that match the operational status you specify.

[-error-type {unknown|acpp|bay|configuration|current|disk|internal|fan|module|port|power|temperature|voltage}, ...] - Error Type

Displays information only about the storage shelves with errors that match the error type you specify.

[-error-severity {unknown|notice|warning|error|critical}, ...] - Error Severity

Displays information only about the storage shelves with errors that match the error severity you specify.

Examples

The following example displays information about all storage shelves:

```
cluster1::> storage shelf show
```

Shelf Name	Shelf ID	Serial Number	Model	Module Type	Operational Status
1.1	1	6000832415	DS2246	IOM6	Critical
1.2	2	6000647652	DS2246	IOM6	Normal
1.3	3	6000003844	DS2246	IOM6	Normal
1.4	4	SHJ000000013A9E	DS4246	IOM6	Normal
1.5	5	SHJ000000013A84	DS4246	IOM6	Normal
1.6	6	6000005555	DS2246	IOM6	Normal

6 entries were displayed.

```

cluster1::> storage shelf show -errors

Shelf Name: 1.1
Shelf UID: 50:0a:09:80:01:cb:d6:84
Serial Number: 6000832415

Error Type      Description
-----
Power           Critical condition is detected in storage shelf power supply unit "1". The unit might fail.
Temperature     Critical over temperature failure for temperature sensor "1". Current temperature: "75" C ("167" F).

```

Storage ACP Commands

Manage alternate control path (ACP)

The `storage shelf acp` command family manages the alternate control path connectivity on the system. The command set allows you to view the current connectivity, and the ACP modules. You can also configure the connection or disable the connection across the cluster.

storage shelf acp configure

Configure alternate control path (ACP)

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Configure the ACP connectivity on the cluster.

Parameters

-is-enabled {true|false} - Is Enabled?

Configures the connectivity to the specified state.

[-subnet <IP Address>] - Subnet

Configures the connectivity to the specified subnet.

[-netmask <IP Address>] - Netmask

Configures the connectivity to the specified netmask.

[-channel {out-of-band|in-band}] - Channel

Configures the connectivity to the specified channel.

Examples

The following example configures out-of-band ACP connectivity on each node:

```
cluster1::> storage shelf acp configure -is-enabled true -channel out-of-band -subnet 192.168.0.1 -netmask 255.255.255.0
```

The following example configures in-band ACP connectivity on each node:

```
cluster1::> storage shelf acp configure -is-enabled true -channel in-band
```

The following example disables ACP connectivity on each node:

```
cluster1::> storage shelf acp configure -is-enabled false
```

storage shelf acp show

Show connectivity information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Displays information about the ACP connectivity on each node

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <field-name>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-errors]

If you specify the -errors parameter, the command displays detailed information about all modules with errors.

| [-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the nodes that match this parameter value.

[-is-enabled {true|false}] - Is Enabled?

Selects the nodes that are enabled or disabled.

[-port <text>] - Port

Selects the nodes that match the specified port on which ACP is configured.

[-address <IP Address>] - IP Address

Selects the nodes with the specified IP address.

[-subnet <IP Address>] - Subnet

Selects the nodes with the specified subnet.

[-netmask <IP Address>] - Netmask

Selects the nodes with the specified netmask.

[-connection-status {no-connectivity|partial-connectivity|full-connectivity|additional-connectivity|unknown-connectivity|not-available|connection-disabled}] - Connection Status

Selects the nodes with the specified connection status.

[-error-id <integer>] - Error ID

Selects the node with the specified error ID.

[-error-type {No-Error|Connection-Issue|Connection-Activity|Module-Error|Shelf-Error}] - Error Type

The error type, in case of a connection error.

[-error-severity {unknown|notice|warning|error|critical}] - Error Severity

The error severity, in case of a connection error.

[-error-text <text>] - Error Text

Selects the node with the specified error text.

[-corrective-action <text>] - Corrective Action

Selects the node with the specified corrective action.

[-channel {unknown|out-of-band|in-band}] - Channel

Selects the nodes that has channel configured out-of-band or in-band.

Examples

The following example displays ACP connectivity on each node:

```
cluster1::> storage shelf acp show
```

Node	Channel	Connectivity
stor-8020-1	in-band	active
stor-8020-2	in-band	active
stor-8060-1	out-of-band	full-connectivity
stor-8060-2	out-of-band	full-connectivity

4 entries were displayed.

The following example displays the -instance output of the storage acp show. More details on the connectivity and configuration can be seen [here](#).

```
cluster1::> storage shelf acp show -instance
```

```

      Node: stor-8020-1
    Channel: out-of-band
  Enable Status: enabled
      Port: e0P
    IP Address: 192.168.1.74
      Subnet: 192.168.0.1
     Netmask: 255.255.252.0
Connection Status: full-connectivity

      Node: stor-8020-1
    Channel: in-band
  Enable Status: enabled
Connection Status: active
2 entries were displayed.
```

storage shelf acp module commands

Display the modules connected to the cluster

storage shelf acp module show

Show modules connected to the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Displays information about the modules connected to each node

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <field-name>", ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify

| [-errors]

If you specify the -errors parameter, the command displays detailed information about all modules with errors.

| [-instance]}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the modules that match this parameter value.

[-mac-address <text>] - MAC Address

Selects the module that match the specified MAC address.

[-module-name <text>] - Module name

Selects the module that match the specified module name.

[-module-address <IP Address>] - IP Address

Selects the module that match the specified IP address.

[-protocol-version <text>] - Protocol Version

Selects the modules that match the specified protocol version.

[-firmware-version <text>] - Firmware Version

Selects the modules that match the specified firmware version.

[-acpa-id <integer>] - ACPA assigner ID

Selects the modules that match the specified ACPA ID.

[-shelf-serial-number <text>] - Shelf Serial Number

Selects the modules that match the specified shelf serial number.

[-iom-type {Unknown|iom3|iom6|iom6e|iom12|iom12e|iom12f}] - IOM Type

Selects the modules that match the specified IOM type (IOM3/IOM6/IOM6E).

[-last-contact <integer>] - Last Contact (secs)

Selects the modules that match the specified last contact.

[-state {unknown|initializing|discovery-complete|awaiting-inband|no-inband|active|awaiting-bootp|updating-firmware|connection-error|firmware-update-required|rebooting|fail|unsupported|degraded|shelf-off}] - Local Node State

Selects the modules that match the specified state.

[-stack-id {<integer>|-}] - Stack ID

Selects the modules that match the specified stack ID.

[-shelf-id <text>] - Shelf ID

Selects the modules that match the specified shelf ID.

[-adapter-name <text>] - Adapter Name

Selects the modules that match the specified adapter name.

[-error-id <integer>, ...] - Error ID

Selects the modules that match the specified error ID.

[-error-text <text>, ...] - Error Text

The error text, in case of a module error.

[-corrective-action <text>, ...] - Corrective Action

The corrective action, in case of a module error.

[-error-type {No-Error|Connection-Issue|Connection-Activity|Module-Error|Shelf-Error}, ...] - Error Type

Selects the modules that match the specified error type.

[-error-severity {unknown|notice|warning|error|critical}, ...] - Error Severity

Selects the modules that match the specified error severity.

[-power-cycle-count <integer>] - Power Cycle count

Number of times a shelf power cycle has been performed on a shelf

[-power-off-count <integer>] - Power Off count

Number of times a shelf power off has been performed on a shelf

[-power-on-count <integer>] - Power On count

Number of times a shelf power on has been performed on a shelf

[-expander-reset-count <integer>] - Expander reset count

Number of times an expander reset has been performed on a module

[-expander-power-cycle-count <integer>] - Expander power cycle count

Number of times an expander power cycle has been performed on a module

Examples

The following example displays the ACP modules connected to each node:

```
cluster1::> storage shelf acp module show
Node      Module Name      State
-----
stor-v4-1a-1b-01  1.10.A           Active

storage shelf drawer commands

The drawer directory

storage shelf drawer show

Display a list of drawers

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage shelf drawer show` command displays information for storage shelf drawers in the storage system. If no parameters are specified, the default command displays the following information for the drawers:

- Shelf Name
- Drawer Number
- Status
- Closed/Open
- Disk Count
- Firmware

To display detailed information for a single drawer, use the `-shelf` and `-drawer` parameters.

Parameters

{ [-fields <fieldname>, ...]

Displays the specified fields for all drawers, in column style output.

| [-errors]

Displays the following error status information about the drawers that have errors:

- Status
- Error Description

| [-instance]

Displays expanded information for all drawers in the system. If a shelf and drawer are specified, then this parameter displays the same detailed information for the specified drawer as does the -shelf and -drawer parameters.

[-shelf <text>] - Shelf Name

Displays the drawers in the storage shelf that matches the specified shelf name.

[-drawer <integer>] - Drawer Number

Displays the drawers that match the specified drawer number.

[-node {<nodename>|local}] - Node Name

Displays the drawers that are present for the specified node.

[-disk-count <integer>] - Drawer Disk Count

Displays the drawers that have the specified disk count.

[-part-number <text>] - Part Number

Displays the drawers that have the specified part number.

[-serial-number <text>] - Serial Number

Displays the drawer that matches the specified serial number.

[-is-closed {open|closed}] - Drawer is Closed?

Displays the drawers that are closed or open.

[-firmware-a <text>] - Firmware A

Displays the drawers for which module A has the specified firmware version.

[-firmware-b <text>] - Firmware B

Displays the drawers for which module B has the specified firmware version.

[-path-a {unknown|ok|degraded|none}] - Path A

Displays the drawers for which module A has the specified path status.

[-path-b {unknown|ok|degraded|none}] - Path B

Displays about drawers for which module B has the specified path status.

[-is-supported {yes|no}] - Drawer is Supported?

Displays the drawers that are supported (TRUE) or not supported (FALSE).

[-vendor <text>] - Vendor Name

Displays the drawers that match the specified vendor.

[-mfg-date <text>] - Mfg. Date

Displays the drawers that match the specified manufactured date.

[-fru-type <text>] - FRU Type

Displays the drawers that match the specified FRU type.

[-status-a {unknown|normal|warning|error|critical}] - Status A

Displays the drawers with module A currently operating under the specified status.

[-status-b {unknown|normal|warning|error|critical}] - Status B

Displays the drawers with module B currently operating under the specified status.

[-error <text>] - Error

Displays the drawers that match the specified error description.

Examples

The following example displays information about all drawers:

```
cluster1::> storage shelf drawer show
```

Shelf	Drawer	Status A/B	Drawer Closed?	Disk Count	Firmware A/B
2.5	1	normal/normal	closed	4	00000634/00000634
	2	normal/normal	closed	4	00000634/00000634
	3	normal/normal	closed	4	00000634/00000634
	4	normal/normal	closed	5	00000634/00000634
	5	normal/normal	closed	4	00000634/00000634

5 entries were displayed.
cluster1::>

The following example displays expanded information about drawer 1 in shelf 2.5:

```
cluster1::> storage shelf drawer show -shelf 2.5 -drawer 1
```

Shelf: 2.5
Drawer ID: 1
Part Number: 111-03071
Serial Number: 021604008153
Drawer is Closed?: closed
Disk Count: 4
Firmware A: 00000634
Firmware B: 00000634
Path A: ok
Path B: ok
Status A: normal
Status B: normal
Drawer is Supported?: yes
Vendor Name: NETAPP
Mfg. Date: 02/2016
FRU Type: SASDRWR
Error Description: -
cluster1::>

The following example displays error information about the drawers that have errors:

```
cluster1::> storage shelf drawer show -errors
```

Shelf	Drawer	Status A/B	Error Description
2.5	2	warning/warning	Drawer open.

cluster1::>

storage shelf drawer show-phy

Display a list of PHYs per drawer

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage shelf drawer show-phy` command displays information for drawer PHYs in the storage system. If no parameters are specified, the default command displays the following information about PHYs:

- Shelf Name
- Drawer Number
- PHY Number
- Type
- SAS Address
- State

To display detailed information about a single PHY, use the `-shelf`, `-drawer`, and `-phy` parameters.

Parameters

{ [-fields <fieldname>, ...]

Displays the specified fields for all drawer PHYs, in column style output.

[-instance]

Displays expanded information for all drawer PHYs in the system. If a shelf, drawer, and PHY are specified, then this parameter displays the same detailed information for the PHY you specify as does the `-shelf`, `-drawer`, and `-phy` parameters.

[-shelf <text>] - Shelf Name

Displays the PHYs in the storage shelf that matches the specified shelf name.

[-drawer <integer>] - Drawer Number

Displays the PHYs in the drawers that match the specified drawer number.

[-phy <integer>] - PHY Number

Displays the PHYs that match the specified PHY number.

[-node {<nodename>|local}] - Node Name

Displays the PHYs that are present for the specified node.

[-type {unknown|disk|virtual|input}] - Type

Displays the PHYs with the specified type.

[-physical-id <integer>] - Physical ID

Displays the PHYs that match the specified physical-id.

[-sas-address <text>] - Attached SAS Address

Displays the PHYs with the specified attached sas address.

[-state-a {unknown|enabled|disabled}] - State Module A

Displays the PHYs for which module A has the specified state.

[-state-b {unknown|enabled|disabled}] - State Module B

Displays the PHYs for which module B has the specified state.

[-status-a <Drawer PHY Status>] - Status Module A

Displays the PHYs with module A currently operating under the specified status.

[-status-b <Drawer PHY Status>] - Status Module B

Displays the PHYs with module B currently operating under the specified status.

Examples

The following example displays information about all drawer PHYs:

cluster1::> storage shelf drawer show-phy

Shelf	Drawer	PHY #	Type	SAS Address	PHY State A/B

cluster1::>

```

The following example displays expanded information for PHY 0 of drawer 1 in shelf 2.5:

```

cluster1::> storage shelf drawer show-phy -shelf 2.5 -drawer 1 -phy 0

Shelf: 2.5
Drawer ID: 1
PHY Number: 0
Type: disk
Physical ID: 1
SAS Address: 00c5005079183f85
State A: enabled
State B: enabled
Status A: enabled-12gbs
Status B: enabled-12gbs

cluster1::>

```

storage shelf drawer show-slot

Display a map between bay number and drawer/slot number

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage shelf drawer show-slot` command maps each drawer and slot number to the corresponding bay number.

Parameters

{ [-fields <fieldname>, ...]

Displays the specified fields in column style output.

| [-instance]

Displays all slot information.

[-shelf <text>] - Shelf Name

Displays the slots in the shelf that matches the specified shelf name.

[-bay <integer>] - Bay Number

Displays the slots that have the specified bay number.

[-node {<nodename>|local}] - Node Name

Displays the slots that are present for the specified node.

[-drawer <integer>] - Drawer Number

Displays the slots in the drawers that match the specified drawer number.

[-slot <integer>] - Slot Number

Displays the slots that match the specified slot number.

[-is-installed {yes|no}] - Is Disk Installed

Displays the slots that have a disk installed.

Examples

The following example displays the mapping from drawer and slot number to bay number:

```
cluster1::> storage shelf drawer show-slot
```

Shelf	Drawer	Slot	Bay	Installed?
2.5				
	1			
		0	0	yes
		1	1	no
		2	2	no

cluster1::>

```

storage shelf firmware commands

The firmware directory

storage shelf firmware show-update-status

Display the Shelf Firmware Update (SFU) Status.

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage shelf firmware show-update-status` command displays the state of the Shelf Firmware Update process.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node

Selects the node that matches this parameter value.

[-update-status {running|idle}] - Disk Shelf Firmware Update Status

Selects the nodes whose SFU process status matches this parameter value. Possible values are:

- `running` - Disk shelf firmware update is in progress.
- `idle` - Disk shelf firmware update is not in progress.

[-in-progress-count <integer>] - Number of Shelves with Earlier Revisions Being Updated

Selects the nodes that matches the number of shelves the SFU process is updating to this parameter value. This specifies the number of shelves with earlier revisions that are being updated.

Examples

```

cluster1::*> storage shelf firmware show-update-status
      Update  In-Progress
Node   Status      Count
-----
cluster-n1  running      10
cluster-n2   idle         -
cluster-n3  running       7

```

storage shelf firmware update

Update Shelf Firmware

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage shelf firmware update` command updates the firmware on one or more shelves. You can download the latest firmware by using the “[storage firmware download](#)” on [page 941](#) command. You can specify a shelf whose firmware is to be updated by using the `-shelf` parameter. You can update the firmware on all the shelves by not providing the `-shelf` parameter. All the shelves of a specific module type can be updated by providing a value to the `-module-type` parameter.

Parameters

{ [-shelf <text>] - Shelf Name

This specifies the name of the shelf whose firmware is to be updated.

| [-module-type {atfcx|esh4|iom3|iom6|iom6e|iom12|iom12e}]] - Shelf Module Type

Update the firmware on the shelves that match the module-type you specify.

[-refresh [true]] - Refresh

Forces an update on the shelf with the highest revision of the applicable firmware, resulting in a refresh of the firmware image already present on the shelf.

Examples

The following example updates the firmware on all the shelves in the cluster:

```
cluster1::*> storage shelf firmware update
```

The following example updates the firmware on all shelves with the IOM6 module type:

```
cluster1::*> storage shelf firmware update -module-type IOM6
```

The following example updates the firmware on shelf 1.2:

```
cluster1::*> storage shelf firmware update -shelf 1.2
```

The following example refreshes the firmware on all shelves with the IOM6 module type:

```
cluster1::*> storage shelf firmware update -refresh -module-type IOM6
```

The following example refreshes the firmware on shelf 1.2:

```
cluster1::*> storage shelf firmware update -refresh -shelf 1.2
```

storage shelf location-led commands

Manage the shelf location led

storage shelf location-led modify

Modify the state of the shelf Location LED

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage shelf location-led modify` command modifies the on/off state of the shelf location LED.

Parameters

-shelf-name <text> - Shelf Name

This parameter specifies the shelf whose LED is to be turned on or turned off.

[-led-status {on|off}] - Location LED

This parameter specifies whether the shelf location LED needs to be turned on or turned off.

Examples

The following example turns on the shelf location LED of the specified shelf.

```
cluster1::> storage shelf location-led modify -node node1 -shelf-name 1.0 -led-status on
Info: Shelf locate request successful for shelf "1.0".
```

The following example turns off the shelf location LED of the specified shelf.

```
cluster1::> storage shelf location-led modify -node node1 -shelf-name 1.0 -led-status off
Info: Shelf locate request successful for shelf "1.0".
```

storage shelf location-led show

Display the Location LED status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage shelf location-led show` command displays the state of shelf location LED.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-shelf-name <text>] - Shelf Name

Selects the shelves whose shelf-name matches this parameter value.

[-node {<nodename>|local}] - Node Name

Selects the nodes that match this parameter value.

[-stack-id <integer>] - Stack ID

Selects the shelves whose stack-id matches this parameter value.

[-shelf-id <integer>] - Shelf ID

Selects the shelves whose shelf-id matches this parameter value.

[-led-status {on|off}] - Location LED

Shows the state of the shelf location LED.

Examples

The following example shows the state of the shelf location LED for each shelf.

```
cluster1::> storage shelf location-led show
Shelf Name Stack ID Shelf ID LED Status
-----
      8.2         8         2 off
      8.3         8         3 off
      6.0         6         0 unsupported
      8.1         8         1 off
```

4 entries were displayed.

storage switch commands

Storage switch monitoring commands

storage switch add

Add a back-end switch for monitoring

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage switch add` command enables you to add FC switches for SNMP monitoring in a MetroCluster configuration. Front end switches should not be added for monitoring and will result in a Monitor Status Error condition.

Parameters

-address <IP Address> - FC Switch Management IP Address

This parameter specifies the IP address of the back-end switch that is added for monitoring.

[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - Supported SNMP Version

This parameter specifies the SNMP version that Data ONTAP uses to communicate with the back-end switch that is added for monitoring. The default SNMP version is SNMPv2c.

{ [-snmp-community <text>] - (DEPRECATED)-SNMPv2c Community or SNMPv3 Username

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use `-snmp-community-or-username` instead.

This parameter specifies the SNMPv2c community set or SNMPv3 username on the switch that is added for monitoring.

[-snmp-community-or-username <text>] - SNMPv2c Community or SNMPv3 Username

This parameter specifies the SNMPv2c community set or SNMPv3 username on the switch that is added for monitoring.

[-veto-backend-fabric-check {true|false}] - Veto Back-end Fabric Check? (privilege: advanced)

If specified, the `storage switch add` command will not check if the switch is present in the MetroCluster's back-end fabric. By default, it does not let you add switches that are not present.

[-blades <integer>, ...] - Cisco Director Class Switch Blades to Monitor

This parameter specifies the blades to monitor on the back-end switch that is added for monitoring. It is only applicable to director-class switches.

Examples

The following command adds a back-end switch with IP Address 10.226.197.34 for monitoring:

```
cluster1::> storage switch add -address 10.226.197.34 -snmp-community-or-username public

cluster1::> storage switch show
Switch      Symbolic      Vendor  Model      Switch WWN      Is      Monitor
Name        Name          Model   Model      WWN            Monitored Status
-----
Cisco_10.226.197.34
      mcc-cisco-8Gb-fab-4
      Cisco    DS-C9148-16P-K9
      2000547fee78f088 true      ok
mcc-cisco-8Gb-fab-1
      mcc-cisco-8Gb-fab-1
```

```

        Cisco      -      -      false      -
mcc-cisco-8Gb-fab-2
        mcc-cisco-8Gb-fab-2
        Cisco      -      -      false      -
mcc-cisco-8Gb-fab-3
        mcc-cisco-8Gb-fab-3
        Cisco      -      -      false      -
4 entries were displayed.

cluster1::>

```

The following command adds a Cisco Director Class switch for monitoring. Data ONTAP uses SNMPv3 and 'snmpuser1' username to communicate with this switch.

```
cluster1::> storage switch add -address 10.228.56.208 -snmp-version SNMPv3 -snmp-community-or-username snmpuser1 -blades 3,4
```

storage switch modify

Modify information about a back-end switch's configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage switch modify` enables you to modify certain parameters for identifying and accessing the FC back-end switches added for monitoring in a MetroCluster configuration.

Parameters

-switch-name <text> - FC Switch Name

This parameter specifies the name of the switch.

[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version

This parameter specifies the SNMP version that Data ONTAP uses to communicate with the switch.

[-switch-ipaddress <IP Address>] - Switch IP Address

This parameter specifies the IP address of the switch.

{ [-snmp-community <text>] - (DEPRECATED)-SNMPv2c Community or SNMPv3 Username

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use `-snmp-community-or-username` instead.

This parameter specifies the SNMPv2c community set or SNMPv3 username on the switch.

| [-snmp-community-or-username <text>]} - SNMPv2c Community or SNMPv3 Username

This parameter specifies the SNMPv2c community set or SNMPv3 username on the switch.

[-blades <integer>, ...] - Director-Class Switch Blades to Monitor

This parameter specifies the blades to monitor on the switch. It is only applicable to director-class switches.

Examples

The following command modifies Cisco_10.226.197.34 switch SNMP community to 'public':

```
cluster1::> storage switch modify -switch-name Cisco_10.226.197.34 -switch-ipaddress 10.226.197.34 -snmp-community-or-username public
cluster1::>
```

The following command modifies the blades monitored on a director-class switch:

```
cluster1::> storage switch modify -switch-name Cisco_10.228.56.208 -blades 3,4
cluster1::>
```

The following command modifies Brocade 6505 switch SNMP version to SNMPv3 and SNMPv3 username to 'snmpuser1':

```
cluster1::> storage switch modify -switch-name Brocade6505 -switch-ipaddress 10.226.197.34 -snmp-version SNMPv3 -snmp-community-or-username snmpuser1
cluster1::>
```

storage switch refresh

Refresh storage switch info

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage switch refresh` command triggers a refresh of the SNMP data for the MetroCluster FC switches and FC-to-SAS bridges. It does not do anything if the refresh is already going on. The FC switches and FC-to-SAS bridges must have been previously added for monitoring by using the [“storage switch add” on page 1010](#) and [“storage bridge add” on page 845](#) commands respectively.

Examples

The following command triggers a refresh for the SNMP data:

```
cluster1::*> storage switch refresh
cluster1::*>
```

storage switch remove

Remove a back-end switch from monitoring

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage switch remove` enables you to remove FC back-end switches that were previously added for SNMP monitoring.

Parameters

-switch-name <text> - FC Switch Name

This parameter specifies the name of the back-end switch added for monitoring.

Examples

The following command removes 'Cisco_10.226.197.34' switch from monitoring:

```
cluster1::> storage switch show
      Symbolic
Switch  Name      Vendor  Model      Switch WWN      Is      Monitor
-----
Cisco_10.226.197.34
      mcc-cisco-8Gb-fab-4
      Cisco      DS-C9148-16P-K9      2000547fee78f088  true      ok
mcc-cisco-8Gb-fab-1
      mcc-cisco-8Gb-fab-1
      Cisco      -      -      false      -
mcc-cisco-8Gb-fab-2
      mcc-cisco-8Gb-fab-2
      Cisco      -      -      false      -
mcc-cisco-8Gb-fab-3
      mcc-cisco-8Gb-fab-3
      Cisco      -      -      false      -
4 entries were displayed.
```

```

cluster1::> storage switch remove -switch-name Cisco_10.226.197.34

cluster1::> storage switch show

```

Switch	Symbolic Name	Vendor	Model	Switch WWN	Is Monitored	Monitor Status
mcc-cisco-8Gb-fab-4	mcc-cisco-8Gb-fab-4	Cisco	-	-	false	-
mcc-cisco-8Gb-fab-1	mcc-cisco-8Gb-fab-1	Cisco	-	-	false	-
mcc-cisco-8Gb-fab-2	mcc-cisco-8Gb-fab-2	Cisco	-	-	false	-
mcc-cisco-8Gb-fab-3	mcc-cisco-8Gb-fab-3	Cisco	-	-	false	-

storage switch show

Display switch information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage switch show` command displays information about all the storage switches in the MetroCluster configuration. The back-end switches must have been previously added for monitoring using the “[storage switch add](#)” on [page 1010](#) command. If no parameters are specified, the default command displays the following information about the storage switches:

- Switch
- Symbolic Name
- Vendor
- Model
- Switch WWN
- Is Monitored
- Monitor Status

To display detailed profile information about a single storage switch, use the `-switch-name` parameter.

Parameters

{ **[-fields** *<fieldname>*, ...]

Displays the specified fields for all the storage switches, in column style output.

| **[-connectivity]**

Displays the following details about the connectivity from the storage switch to connected entities:

- Port name
- Port operating mode
- Port world wide name
- Peer port world wide name
- Peer type

- Additional information about peer

Displays the following details about the connectivity from the node to the storage switch:

- Node name
- Adapter name
- Switch port name
- Switch port speed
- Adapter type

| **[-cooling]**

Displays the following details about the fans and temperature sensors on the storage switch:

- Fan name
- Fan speed in rotations per minute (RPM)
- Fan operational status
- Temperature sensor name
- Temperature sensor reading in Celsius (C)
- Temperature sensor status

| **[-error]**

Displays the errors related to the storage switch.

| **[-port]**

Displays the following details about the storage switch ports:

- Port name
- Port world wide name
- Port administrative status
- Port operational status
- Port operating mode
- Whether SFP is present in the port
- Port speed in gigabits per second (Gbps)
- Port BB credit
- Peer port world wide name

| **[-power]**

Displays the following details about the storage switch power supplies:

- Power supply name
- Power supply serial number
- Power supply operational status

| **[-san-config]**

Displays the following details about the Virtual Storage Area Networks (VSAN) and Zones of the storage switch:

- VSAN identifier
- VSAN name
- VSAN operational status
- Type of load balancing configured for the VSAN
- Where in-order-delivery set for the VSAN

- Whether the auto power reset of the PSU is enabled
- VAA member switch name and port
- Zone name
- VAA ID of the zone
- Zone member switch name and port
- Zone member port id
- Zone member port world wide name

| [-sfp]

Displays the following details about the storage switch ports Small Formfactor Pluggable (SFP):

- Port name
- Type of SFP
- SFP transmitter type
- SFP vendor
- SFP part number
- SFP serial number

| [-stats]

Displays the following details about the storage switch ports:

- Port name
- Frames received through the port (Rx Frames)
- Frames transmitted through the port (Tx Frames)
- Octets received through the port (Rx Octets)
- Octets transmitted through the port (Tx Octets)
- Port error frames

| [-instance]

Displays expanded information about all the storage switches in the system. If a storage switch is specified, then this parameter displays the same detailed information for the storage switch you specify as does the -switch-name parameter.

[-switch-name <text>] - FC Switch Name

Displays information only about the storage switches that match the name you specify.

[-switch-wwn <text>] - Switch World Wide Name

Displays information only about the storage switches that match the switch wwn you specify.

[-switch-symbolic-name <text>] - Switch Symbolic Name

Displays information only about the storage switches that match the switch symbolic name you specify.

[-switch-fabric-name <text>] - Fabric Name

Displays information only about the storage switches that match the switch fabric you specify.

[-domain-id <integer>] - Switch Domain ID

Displays information only about the storage switches that match the switch domain id you specify.

[-switch-role {unknown|primary|subordinate}] - Switch Role in Fabric

Displays information only about the storage switches that match the switch role you specify.

[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version

Displays information only about the storage switches that match the switch SNMP version you specify.

[-switch-model <text>] - Switch Model

Displays information only about the storage switches that match the switch model you specify.

[-switch-vendor {unknown|Brocade|Cisco}] - Switch Vendor

Displays information only about the storage switches that match the switch vendor you specify.

[-fw-version <text>] - Switch Firmware Version

Displays information only about the storage switches that match the switch firmware version you specify.

[-serial-number <text>] - Switch Serial Number

Displays information only about the storage switches that match the switch serial number you specify.

[-switch-ipaddress <IP Address>] - Switch IP Address

Displays information only about the storage switches that match the switch IP address you specify.

[-switch-status {unknown|ok|error}] - Switch Status

Displays information only about the storage switches that match the switch status you specify.

[-snmp-community <text>] - (DEPRECATED)-SNMPv2c Community or SNMPv3 Username

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use `-snmp-community-or-username` instead.

Displays information only about the storage switches that match the switch SNMPv2c community or SNMPv3 username you specify.

[-snmp-community-or-username <text>] - SNMPv2c Community or SNMPv3 Username

Displays information only about the storage switches that match the switch SNMPv2c community or SNMPv3 username you specify.

[-profile-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]]] - Switch Profile Data Last Successful Refresh Timestamp

Displays information only about the storage switches that match the profile data last successful refresh timestamp you specify.

[-is-monitoring-enabled {true|false}] - Is Monitoring Enabled for Switch

Displays information only about the storage switches that match the switch monitoring value you specify.

[-blades <integer>, ...] - Director-Class Switch Blades to Monitor

Displays information only about the storage switches that match the blade value you specify.

[-engine-id <Hex String>] - Engine ID of SNMPv3 Capable Switch

Displays information only about the storage switches that match the SNMPv3 engine-id you specify.

[-psu-name-list <text>, ...] - Switch Power Supply Name List

Displays information only about the storage switches that have the power supply units with the names you specify.

[-psu-serial-number-list <text>, ...] - Switch Power Supply Serial Number List

Displays information only about the storage switches that have the power supply units with the serial numbers you specify.

[-psu-status-list {unknown|normal|warning|faulty|not-present}, ...] - Switch Power Supply Status List

Displays information only about the storage switches that have the power supply units with the statuses you specify.

[-psu-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]]] - Switch Power Supply Data Last Successful Refresh Timestamp

Displays information only about the storage switches that match the power supply unit data last successful refresh timestamp you specify.

[-temp-sensor-name-list <text>, ...] - Switch Temperature Sensor Name List

Displays information only about the storage switches that have the temperature sensors with the names you specify. Displays information only about the storage switches that have the temperature sensors

with the names you specify. Displays information only about the storage switches that have the temperature sensors with the names you specify.

[-temp-sensor-reading-list <integer>, ...] - Switch Temperature Sensor Reading (C) List

Displays information only about the storage switches that have the temperature sensors with the readings you specify.

[-temp-sensor-status-list {unknown|normal|warning|critical}, ...] - Switch Temperature Sensor Status List

Displays information only about the storage switches that have the temperature sensors with the statuses you specify.

[-temp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]]] - Switch Temperature Sensor Data Last Successful Refresh Timestamp

Displays information only about the storage switches that match the temperature sensor data last successful refresh timestamp you specify.

[-fan-name-list <text>, ...] - Switch Fan Name List

Displays information only about the storage switches that match the fans with the names you specify.

[-fan-rpm-list <integer>, ...] - Switch Fan Speed (RPM) List

Displays information only about the storage switches that match the fans with the RPM speeds you specify.

[-fan-status-list {unknown|operational|failed|not-operational|not-present}, ...] - Switch Fan Operational Status List

Displays information only about the storage switches that match the fans with the statuses you specify.

[-fan-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]]] - Switch Fan Data Last Successful Refresh Timestamp

Displays information only about the storage switches that match the fan data last successful refresh timestamp you specify.

[-vsan-index-list <integer>, ...] - Switch VSAN Index List

Displays information only about the storage switches that have the VSANs with the indexes you specify.

[-vsan-name-list <text>, ...] - Switch VSAN Name List

Displays information only about the storage switches that have the VSANs with the names you specify.

[-vsan-oper-status-list {up|down}, ...] - Switch VSAN Operational Status List

Displays information only about the storage switches that have the VSANs with the operational statuses you specify.

[-vsan-load-balancing-type-list {src-id-dest-id|src-id-dest-id-ox-id}, ...] - Switch VSAN Load balancing Type List

Displays information only about the storage switches that have the VSANs with the load balancing types you specify.

[-is-vsan-iod-list {true|false}, ...] - Is In-order Delivery Set for VSAN List

Displays information only about the storage switches that have the VSANs with the IOD setting you specify.

[-vsan-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]]] - Switch VSAN Data Last Successful Refresh Timestamp

Displays information only about the storage switches that match the VSAN data last successful refresh timestamp you specify.

[-member-switch-name-list <text>, ...] - Member Switch List

Displays information only about the storage switches that have the VSANs with the member switch names you specify.

[-member-switch-port-name-list <text>, ...] - Member Switch Port Name List

Displays information only about the storage switches that have the VSANs with the member switch port names you specify.

[-vsan-id-list <integer>, ...] - Zone VSAN ID List

Displays information only about the storage switches that have the VSANs with the IDs you specify.

[-zone-name-list <text>, ...] - Switch Zone Name List

Displays information only about the storage switches that have the zones with the names you specify.

[-zone-member-sw-domain-id-list <integer>, ...] - Zone Member Switch Port Domain ID List

Displays information only about the storage switches that have the zones with the member switch domain ids you specify.

[-zone-member-port-name-list <text>, ...] - Zone Member Port List

Displays information only about the storage switches that have the zones with the port names you specify.

[-zone-member-port-wwn-list <text>, ...] - Zone Member WWPN List

Displays information only about the storage switches that have the zones with the port WWNs you specify.

[-zone-member-port-switch-name-list <text>, ...] - Zone Member Switch WWN List

Displays information only about the storage switches that have the zones with the member port hosting switch names you specify.

[-zone-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]] - Switch Zone Data Last Successful Refresh Timestamp

Displays information only about the storage switches that match the zone data last successful refresh timestamp you specify.

[-zone-member-wwn-list <text>, ...] - Zone Member WWN List

Displays information only about the storage switches that have the zones with the member WWNs you specify.

[-zone-member-port-id-list <text>, ...] - Zone Member Port ID List

Displays information only about the storage switches that have the zones with the member port ids you specify.

[-port-wwn-list <text>, ...] - Switch Port World Wide Name (WWPN) List

Displays information only about the storage switches that have the ports with the WWNs you specify.

[-port-name-list <text>, ...] - Switch Port Name List

Displays information only about the storage switches that have the ports with the names you specify.

[-port-admin-status-list {unknown|enabled|disabled}, ...] - Switch Port Admin Status List

Displays information only about the storage switches that have the ports with administrative statuses you specify.

[-port-oper-status-list {unknown|online|offline}, ...] - Switch Port Operational Status List

Displays information only about the storage switches that have the ports with operational statuses you specify.

[-port-mode-list {unknown|auto|F-port|FL-port|E-port|TE-port|U-port|G-port}, ...] - Switch Port Mode List

Displays information only about the storage switches that have the ports with the operating modes you specify.

[-port-oper-speed-list <integer>, ...] - Switch Port Current Speed (in Gbits/sec) List

Displays information only about the storage switches that have the ports with the operational speeds you specify.

[-port-bb-credit-list <integer>, ...] - Switch Port BB Credit List

Displays information only about the storage switches that have the ports with the BB credits you specify.

[-port-sfp-present-list {true|false}, ...] - Switch Port Is SFP Present List

Displays information only about the storage switches that have the ports with the SFP present values you specify.

[-port-peer-wwpn-list <text>, ...] - Switch Port Peer WWPN List

Displays information only about the storage switches that have the ports with the peer port WWPNs you specify.

[-port-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]]] - Switch Port Data Last Successful Refresh Timestamp

Displays information only about the storage switches that match the port data last successful refresh timestamp you specify.

[-port-stat-name-list <text>, ...] - Switch Port Name List

Displays information only about the storage switches that have the ports with the names you specify.

[-port-tx-frames-list <integer>, ...] - Switch Port Transmitted Frame Count List

Displays information only about the storage switches that have the ports with the transmitted frames values you specify.

[-port-rx-frames-list <integer>, ...] - Switch Port Received Frame Count List

Displays information only about the storage switches that have the ports with the received frames values you specify.

[-port-tx-octets-list <integer>, ...] - Switch Port Total Transmitted Octets List

Displays information only about the storage switches that have the ports with the transmitted octets values you specify.

[-port-rx-octets-list <integer>, ...] - Switch Port Total Received Octets List

Displays information only about the storage switches that have the ports with the received octets values you specify.

[-port-frame-error-list <integer>, ...] - Switch Port Frame Error Count List

Displays information only about the storage switches that have the ports with the error frame values you specify.

[-port-stat-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]]] - Switch Port Stat Data Last Update Timestamp

Displays information only about the storage switches that match the port statistics data last successful refresh timestamp you specify.

[-sfp-port-name-list <text>, ...] - Switch Port Name List

Displays information only about the storage switches that have the ports with the names you specify.

[-sfp-type-list {unknown|other|gbic|embedded|glm|gbic-with-serial-id|gbic-without-serial-id|sfp-with-serial-id|sfp-without-serial-id|x2p|x2-short|x2-medium|x2-tall|xpak-short|xpak-medium|xpak-tall|xenpak|sfp-dw-dm|qsfp|x2-dw-dm|gbic-not-installed|small-form-factor}, ...] - Switch Port SFP Type List

Displays information only about the storage switches that have the ports with the SFP types you specify.

[-sfp-tx-type-list {unknown|long-wave-laser|short-wave-laser|long-wave-laser-cost-reduced|electrical|ten-gig-base-sr|ten-gig-base-lr|ten-gig-base-er|ten-gig-base-lx4|ten-gig-base-sw|ten-gig-base-lw|ten-gig-base-ew}, ...] - Switch Port SFP Transmitter Type List

Displays information only about the storage switches that have the ports with the SFP transmitter types you specify.

[-sfp-vendor-list <text>, ...] - Switch Port SFP Vendor List

Displays information only about the storage switches that have the ports with the SFP vendors you specify.

[-sfp-part-number-list <text>, ...] - Switch Port SFP Part Number List

Displays information only about the storage switches that have the ports with the SFP part numbers you specify.

[-sfp-serial-number-list <text>, ...] - Switch Port SFP Serial Number List

Displays information only about the storage switches that have the ports with the SFP serial numbers you specify.

[-sfp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]] - Switch Port SFP Data Last Successful Refresh Timestamp

Displays information only about the storage switches that match the port SFP data last successful refresh timestamp you specify.

[-switch-error-text-list <text>, ...] - Switch Error Text List

Displays information only about the storage switches that have the errors you specify.

[-conn-switch-port-name-list <text>, ...] - Switch Port Name List

Displays information only about the storage switches that have the ports with the names you specify.

[-conn-switch-port-mode-list {unknown|auto|F-port|FL-port|E-port|TE-port|U-port|G-port}, ...] - Switch Port Operating Mode List

Displays information only about the storage switches that have the ports with the operating modes you specify.

[-conn-switch-port-wwn-list <text>, ...] - Switch Port WWN List

Displays information only about the storage switches that have the ports with the WWNs you specify.

[-conn-switch-port-peer-port-wwn-list <text>, ...] - Switch Port Peer Port WWN List

Displays information only about the storage switches that have the ports with the peer port WWNs you specify.

[-conn-switch-port-peer-info-list <text>, ...] - Switch Port Peer Host & Port Name List

Displays information only about the storage switches that have the ports with the peer information values you specify.

[-conn-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]] - Switch Connectivity Data Last Successful Refresh Timestamp

Displays information only about the storage switches that match the switch connectivity data last successful refresh timestamp you specify.

[-conn-switch-port-peer-type-list {unknown|bridge|switch|fcp-adapter|fcvi-adapter}, ...] - Switch Port Peer Type List

Displays information only about the storage switches that have the ports connected to the peer types you specify.

[-switch-port-name-list <text>, ...] - Switch Port Name List

Displays information only about the storage switches that have the ports with the names you specify.

[-switch-port-speed-list <integer>, ...] - Switch Port Speed (in Gbps) List

Displays information only about the storage switches that have the ports with the speeds you specify.

[-node-name-list <nodename>, ...] - Node Name List

Displays information only about the storage switches that are connected to the nodes you specify.

[-adapter-name-list <text>, ...] - Node Adapter Name List

Displays information only about the storage switches that are connected to the adapters you specify.

[-adapter-port-name-list <text>, ...] - Node Adapter Port Name List

Displays information only about the storage switches that are connected to the adapter ports you specify.

[-adapter-type-list {unknown|FCP-Initiator|FC-VI|FCP-Target}, ...] - Node Adapter Type List

Displays information only about the storage switches that are connected to the types of adapters you specify.

[-path-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]] - Switch Path Data Last Successful Refresh Timestamp

Displays information only about the storage switches that match the node to switch path data last successful refresh timestamp you specify.

[-name-list <text>, ...] - Switch Name List

Displays information only about the storage switches that match the names you specify.

[-domain-id-list <integer>, ...] - Switch Domain ID List

Displays information only about the storage switches that match the domain ids you specify.

[-wwn-list <text>, ...] - Switch WWN List

Displays information only about the storage switches that match the switch WWNs you specify.

[-role-list {unknown|primary|subordinate}, ...] - Switch Role in Fabric List

Displays information only about the storage switches that match the switch roles you specify.

[-address-list <IP Address>, ...] - Switch IP Address List

Displays information only about the storage switches that match the switch IP addresses you specify.

Examples

The following example displays information about all storage switches:

```
cluster::>storage switch show

storage tape commands

Manage tape devices

storage tape offline

Take a tape drive offline

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command takes the specified tape drive offline.

Parameters

-node {<nodename>|local} - **Node**

Use this parameter to specify the node to which the tape drive is attached.

{ -name <text> - **Tape Drive Device Name**

Use this parameter to specify the device name of the tape drive that needs to be taken offline. The format of the device -name name includes a prefix to specify how the tape cartridge is handled and a suffix to describe the density of the tape. The prefix suggests 'r', 'nr' or 'ur' for rewind, no rewind, or unload/reload and a suffix shows density of 'l', 'm', 'h' or 'a'. For example, a tape device name for this operation might have the form "nrst8m" where 'nr' is the 'no rewind' prefix, 'st8' is the alias-name and 'm'

is the tape density. You can use the 'storage tape show -device-names' command to find more information about device names of tape drives attached to a node.

| -device-id <text> - Tape Drive Device ID

Use this parameter to specify the device ID of the tape drive that needs to be taken offline.

Examples

The following example takes the tape drive with device name 'nrst8m' offline. This tape drive is attached to cluster1-01.

```
cluster1::> storage tape offline -node cluster1-01 -name nrst8m
```

storage tape online

Bring a tape drive online

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command brings a specified tape drive online.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the node to which the tape drive is attached.

{ -device-id <text> - Tape Drive Device ID

Use this parameter to specify the device ID of the tape drive that needs to be brought online.

| -name <text> - Tape Drive Device Name

Use this parameter to specify the device name of the tape drive that needs to be brought online. The format of the device -name name includes a prefix to specify how the tape cartridge is handled and a suffix to describe the density of the tape. The prefix suggests 'r', 'nr' or 'ur' for rewind, no rewind, or unload/reload and a suffix shows density of 'l', 'm', 'h' or 'a'. For example, a tape device name for this operation might have the form "nrst8m" where 'nr' is the 'no rewind' prefix, 'st8' is the alias-name and 'm' is the tape density. You can use the 'storage tape show -device-names' command to find more information about device names of tape drives attached to a node.

Examples

The following example brings the tape drive with device id sw4:2.126L4 attached to the node, cluster1-01, online.

```
cluster1::> storage tape online -node cluster1-01 -device-id sw4:2.126L4
```

storage tape position

Modify a tape drive cartridge position

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command changes the tape drive cartridge position.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the node to which the tape drive is attached.

-name <text> - Tape Drive Device Name

Use this parameter to specify the device name of the tape drive whose cartridge position needs to be changed. The format of the device `-name` includes a prefix to specify how the tape cartridge is handled and a suffix to describe the density of the tape. The prefix suggests 'r', 'nr' or 'ur' for rewind, no rewind, or unload/reload and a suffix shows density of 'l', 'm', 'h' or 'a'. For example, a tape device name for this operation might have the form "nrst8m" where 'nr' is the 'no rewind' prefix, 'st8' is the alias-name and 'm' is the tape density. You can use the 'storage tape show -device-names' command to find more information about device names of tape drives attached to a node.

-operation {weof|fsf|bsf|fsr|bsr|rewind|erase|eom} - Tape Position Operation

Use this parameter to specify the tape positioning operation. The possible values for `-operation` are:

- weof - Write end-of-file marks
- fsf - Forward space end-of-file marks
- bsf - Backward space end-of-file marks
- fsr - Forward space records
- bsr - Backward space records
- rewind - Rewind the tape
- erase - Erase then entire tape media from current position
- eom - Position the tape at end of data (end of media if full)

[-count <integer>] - Count for Positioning

Use this parameter to specify the count for a tape positioning operation. You can specify this parameter only with the following operations: weof, fsf, bsf, fsr, and bsr. The default value of this parameter is one.

Examples

The following example specifies a rewind operation on a tape device. Note the `-count` parameter does not need to be specified for this type of operation.

```
cluster1::> storage tape position -node cluster1-01 -name nrst8m -operation rewind
```

The following example specifies an fsf (forward space filemark) operation on a tape device. Note the `-count` parameter specifies 5 forward space filemarks for this operation.

```
cluster1::> storage tape position -node cluster1-01 -name nrst1a -operation fsf -count 5
```

The following example specifies an eom (end-of-media) operation on a tape device. The 'eom' positions a tape at end of data (end of media if full). Note the `-count` parameter does not need to be specified for this type of operation.

```
cluster1::> storage tape position -node cluster1-01 -name rst0h -operation eom
```

storage tape reset

Reset a tape drive

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command resets a specified tape drive.

Parameters**-node {<nodename>|local} - Node**

Use this parameter to specify the node to which the tape drive is attached.

-device-id <text> - Tape Drive Device ID

Use this parameter to specify the device ID of the tape drive is to be reset.

Examples

The following example resets the tape drive with device ID sw4:2.126L3 attached to the node, cluster1-01.

```
cluster1::> storage tape reset -node cluster1-01 -device-id sw4:2.126L3
```

storage tape show

Display information about tape drives and media changers

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage tape show` command displays information about tape drives and media changers attached to the cluster. Where it appears in the remainder of this document "device" may refer to either a tape drive or a media changer. By default, this command displays the following information about all tape drives and media changers:

- Node to which the tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Description of the tape drive/media changer
- Type of device: tape drive or media changer
- Functional status of the tape drive/media changer

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| **[-alias]**

Displays the tape drive/media changer alias with the following details:

- Node to which tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Alias name of the tape drive/media changer
- Alias mapping for tape drive/media changer

| **[-connectivity]**

Displays the connectivity from the node to the tape drive/media changer with the following details:

- Node to which tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Tape drive/media changer description
- Type of device: tape drive or media changer
- Interface type for the tape drive/media changer
- World Wide Node Name of tape drive/media changer
- World Wide Port Name of tape drive/media changer
- Serial Number of tape drive/media changer
- Tape drive/media changer errors
- Initiator port which hosts the tape drive/media changer

- Alias name of the tape drive/media changer
- Operational state of tape drive/media changer
- Functional status of tape drive/media changer

| [-device-names]

Displays the tape drive names for used tape positioning using the following details: rewind, no rewind, unload/reload and density

- Node to which tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Tape drive/media changer description
- Device Names that include Rewind, no Rewind, Unload/Reload

| [-status]

Displays the status of tape drive/media changer with the following details:

- Device ID of the tape drive/media changer
- Tape drive/media changer description
- World Wide Node Name of tape drive/media changer
- World Wide Port Name of tape drive/media changer
- Serial Number of tape drive/media changer
- Alias name of the tape drive/media changer
- Format used for tape cartridge mounted by tape drive
- Tape drive/media changer errors
- Node to which tape drive/media changer is attached
- Operational state of tape drive/media changer
- File number following last tape drive I/O operation
- Block number following last tape drive I/O operation
- Residual count following last tape drive I/O operation

| [-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-device-id <text>] - Device ID

Selects the tape drive/media changer with the specified device ID.

[-node {<nodename>|local}] - Node

Displays detailed information about tape drives or media changers on the specified node.

[-device-type <text>] - Device Type

Selects the devices with the specified type of tape drive or media changer.

[-description <text>] - Description

Selects the tape drives/media changers with the specified description.

[-alias-name <text>] - Alias Name

Selects the tape drive/media changer with the specified alias name.

[-alias-mapping <text>] - Alias Mapping

Selects the tape drive/media changer with the specified alias mapping.

[-wwnn <text>] - World Wide Node Name

Selects the tape drives/media changers with the specified World Wide Node Name.

[-wwpn <text>] - World Wide Port Name

Selects the tape drive/media changer with the specified World Wide Port Name.

[-serial-number <text>] - Serial Number

Selects the tape drive/media changer with the specified serial number.

[-functional-status {unknown|normal|error}] - Functional Status

Selects the tape drives/media changers with the specified functional status of the device.

[-device-if-type {unknown|fibre-channel|SAS|pSCSI}] - Device Interface Type

Selects the tape drives/media changers with the specified interface type.

[-device-state {unknown|available|ready-write-enabled|ready-write-protected|offline|in-use|error|reserved-by-another-host|normal}] - Operational State of Device

Selects the tape drives/media changers with the specified operational state.

[-format <text>, ...] - Tape Cartridge Format

Selects the tape drives with the specified tape format.

[-error <text>] - Tape Error

Selects the tape drives/media changers with the specified error string.

[-initiator <text>] - Initiator Port

Selects the tape drives/media changers with the specified initiator port.

[-file-number <integer>] - File Number

Selects the tape drives/media changers with the specified file number. The file number is the number of file marks between the beginning of media and current logical position. File number gets modified on write file mark, and forward or backward space file operations. A value of -1 indicates unknown position on the tape media or tape not loaded in the tape drive.

[-block-number <integer>] - Block Number

Selects the tape drives/media changers with the specified block number. The block number is the number of logical blocks between the beginning of tape media or the prior file mark and the current logical position on the tape media. Block number gets modified on writes, reads, and forward or backward space over records (blocks). The block number also gets reset to zero when a file mark is crossed or another file mark is written that designates a new file. If the tape is back spaced to a prior file mark, the block number might be zeroed. A value of -1 indicates unknown position on the tape media or that a tape not loaded in the tape drive.

[-residual-count <integer>] - Residual Count of Last I/O Operation

Selects the tape drives with the specified residual count.

[-device-name-r <text>, ...] - Device Name for Rewind

Selects the tape drives with the specified device name for rewind.

[-device-name-nr <text>, ...] - Device Name for No Rewind

Selects the tape drives with the specified device name for no rewind.

[-device-name-ur <text>, ...] - Device Name for Unload Reload

Selects the tape drives with the specified device name for unload/reload.

[-resv-type {off|persistent|scsi}] - Reservation Type for device

Selects the tape drives with the specified type.

Examples

The following example displays information about all tape drives and media changers attached to the cluster:

```
cluster1::> storage tape show
```

Node: cluster1-01			
Device ID	Device Type	Description	Status
sw4:10.11	tape drive	HP LT0-3	error

```

Node: cluster1-01
Device ID      Device Type      Description      Status
-----
sw4:10.11L1    media changer    PX70-TL         normal

```

The following example displays detailed information about a tape drive named sw4:10.11

```
cluster1::> storage tape show -device-id sw4:10.11
```

```

Node: cluster1-01
Device ID      Device Type      Description      Status
-----
sw4:10.11      tape drive       HP LT0-3        error

```

storage tape show-errors

Display tape drive errors

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage tape show-errors` command displays error information about tape drives attached to the cluster. By default, this command displays the following information about all tape drives:

- Node to which the tape drive is attached
- Device ID of the tape drive
- Type of device(tape drive)
- Description of the tape drive
- Alias name of the tape drive
- Tape drive errors

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Displays detailed information about tape drives on the specified node.

[-device-id <text>] - Device ID

Selects the tape drive with the specified device ID.

[-device-type <text>] - Device Type

Selects the devices with the specified type of tape drive.

[-description <text>] - Description

Selects the tape drives with the specified description.

[-alias-name <text>] - Alias Name

Selects the tape drive with the specified alias name.

[-wwnn <text>] - World Wide Node Name

Selects the tape drives with the specified World Wide Node Name.

[-wwpn <text>] - World Wide Port Name

Selects the tape drive with the specified World Wide Port Name.

[-serial-number <text>] - Serial Number

Selects the tape drive with the specified serial number.

[-error <text>] - Tape Drive Error Description

Selects the tape drives with the specified error string.

[-initiator <text>] - Initiator Port

Selects the tape drives with the specified initiator port.

Examples

The following example shows error information for all tape drives attached to cluster1.

```
cluster1::> storage tape show-errors
      Node: node1
      Device ID: 0d.125
      Device Type: tape drive
      Description: Hewlett-Packard LTO-5
      Alias: st0

      Errors: hardware error; repair or replace tape drive

      Node: node1
      Device ID: 2d.0
      Device Type: tape drive
      Description: IBM LTO-6 ULT3580
      Alias: st2

      Errors: -
```

The following example shows error information for tape drive sw4:2.126L1 attached to the node, node1.

```
cluster1::> storage tape show-errors -device-id sw4:2.126L1 -node node1

      Node: node1
      Device ID: sw4:2.126L1
      Device Type: tape drive
      Description: Hewlett-Packard LTO-3
      Alias: st3

      Errors: -
```

storage tape show-media-changer

Display information about media changers

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This `storage tape show-media-changer` command displays information about media changers attached to the cluster. By default, this command displays the following information about all media changers:

- Device ID of media changer
- Description of media changer
- World Wide Node Name of media changer
- World Wide Port Name of media changer
- Serial number of media changer
- Media changer errors
- Node to which the media changer is attached

- Initiator port which hosts the media changer
- Alias name of media changer
- Operational state of media changer
- Functional status of media changer

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-device-id <text>] - Device ID

Selects the media changer with the specified device ID.

[-node {<nodename>|local}] - Node

Displays detailed information about media changers on the specified node.

[-description <text>] - Description

Selects the media changers with the specified description.

[-alias-name <text>] - Alias Name

Selects the media changer with the specified alias name.

[-wwnn <text>] - World Wide Node Name

Selects the media changers with the specified World Wide Node Name.

[-wwpn <text>] - World Wide Port Name

>Selects the media changer with the specified World Wide Port Name.

[-serial-number <text>] - Serial Number

Selects the media changer with the specified serial number.

[-device-if-type {unknown|fibre-channel|SAS|pSCSI}] - Device If Type

Selects the media changers with the specified interface type.

[-device-state {unknown|available|ready-write-enabled|ready-write-protected|offline|in-use|error|reserved-by-another-host|normal}] - Operational State of Device

Selects the media changers with the specified operational state.

[-error <text>] - Media Changer Error Description

Selects the media changers with the specified error string.

[-initiator <text>] - Initiator Port

Selects the media changers with the specified initiator port.

Examples

The following example displays information about all media changers attached to the cluster:

```
cluster1::> storage tape show-media-changer
```

```
Media Changer: sw4:10.1111
```

```
Description: PX70-TL
```

```
WWNN: 2:00a:000e11:10b919
```

```
WWPN: 2:00b:000e11:10b919
```

```
Serial Number: 00FRU7800000_LL1
```

```
Errors: -
```

```
Paths:
```

Node	Initiator	Alias	Device State	Status

```
cluster1-01          2b          mc0          in-use          normal
```

```
Media Changer: sw4:12.4L1
```

```
Description: NEO-TL

storage tape show-supported-status

Displays the qualification and supported status of tape drives

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the supported and qualification status of all tape drives recognized by Data ONTAP attached to a node in the cluster. This includes nonqualified tape drives. Such tape drives do not have a Tape Configuration File (TCF) on the storage system. A nonqualified tape drive can be used if the tape drive emulates a qualified tape drive or if the appropriate TCF for the nonqualified tape drive is downloaded from the Lenovo Support Site to the storage system.

Parameters

[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the tape drives that match this parameter value.

[-tape-drive <text>] - Tape Drive Name

Selects the tape drives that match this parameter value.

[-is-supported {true|false}] - Tape Drive Supported

Selects the tape drives that match this parameter value.

[-status <text>] - Supported Status

Selects the tape drives that match this parameter value.

Examples

The following example displays support and qualification status of tape drives recognized by Data ONTAP. The command also identifies tape drives attached to the node that are nonqualified (not supported).

```
cluster1::> storage tape show-supported-status
```

```
Node: Node1
```

Tape Drive	Is Supported	Support Status
sw4:2.126L6	false	Nonqualified tape drive
Hewlett-Packard C1533A	true	Qualified
Hewlett-Packard C1553A	true	Qualified
Hewlett-Packard Ultrium 1	true	Qualified
Sony SDX-300C	true	Qualified

Sony SDX-500C	true	Qualified
StorageTek T9840C	true	Dynamically Qualified
StorageTek T9840D	true	Dynamically Qualified
Tandberg LTO-2 HH	true	Dynamically Qualified

The following example displays support and qualification status of tape drives selected by tape-drive. The command identifies the supported status of the selected tape drive.

```
cluster1::> storage tape show-supported-status -tape-drive "Sony SDX-300C"
```

Node: Node1

Tape Drives	Is Supported	Support Status
Sony SDX-300C	true	Qualified

storage tape show-tape-drive

Display information about tape drives

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This `storage tape show-tape-drive` command displays information about tape drives attached to the cluster. By default, this command displays the following information about all tape drives:

- Device ID of tape drive
- Description of tape drive
- World Wide Node Name of tape drive
- World Wide Port Name of tape drive
- Serial Number of tape drive
- Tape drive errors
- Node to which the tape drive is attached
- Initiator port which hosts the tape drive
- Alias name of tape drive
- Operational state of tape drive
- Functional status of tape drive

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-device-id <text>] - Device ID

Selects the tape drive with the specified device ID.

[-node {<nodename>|local}] - Node

Displays detailed information about tape drives on the specified node.

[-description <text>] - Description

Selects the tape drives with the specified description.

[-alias-name <text>] - Alias Name

Selects the tape drive with the specified alias name.

[-wwnn <text>] - World Wide Node Name

Selects the tape drives with the specified World Wide Node Name.

[-wwpn <text>] - World Wide Port Name

Selects the tape drive with the specified World Wide Port Name.

[-serial-number <text>] - Serial Number

Selects the tape drive with the specified serial number.

[-device-if-type {unknown|fibre-channel|SAS|pSCSI}] - Device If Type

Selects the tape drives with the specified interface type.

[-device-state {unknown|available|ready-write-enabled|ready-write-protected|offline|in-use|error|reserved-by-another-host|normal}] - Operational State of Device

Selects the tape drives with the specified operational state.

[-error <text>] - Tape Drive Error Description

Selects the tape drives with the specified error string.

[-initiator <text>] - Initiator Port

Selects the tape drives with the specified initiator port.

[-resv-type {off|persistent|scsi}] - Reservation type for device

Selects the tape drives with the specified type.

Examples

The following example displays information about all tape drives attached to the cluster:

```
cluster1::> storage tape show-tape-drive
```

```
Tape Drive: sw4:11.126
Description: StorageTek T10000C
  WWNN: 5:001:04f000:b39ec8
  WWPN: 5:001:04f000:b39ec9
Serial Number: 576004000041
```

Errors: -

Node	Initiator	Alias	Device State	Status
cluster1-01	2a	st0	ready-write-enabled	normal

```
Tape Drive: sw4:12.4
Description: HP LT0-3
  WWNN: 2:001:000e11:10b919
  WWPN: 2:002:000e11:10b919
Serial Number: 1068000371
```

Errors: -

Node	Initiator	Alias	Device State	Status
cluster1-01	0b	st1	ready-write-enabled	normal

storage tape trace

Enable/disable tape trace operations

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command enables or disables diagnostic tape trace operations for all tape drives attached to the node you have specified.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the node on which the tape trace feature is enabled or disabled.

[-is-trace-enabled {true|false}] - Tape Trace Enabled or Disabled

Use this parameter to enable or disable the tape trace feature. By default, the tape trace feature is enabled.

Examples

The following example enables tape trace operation on the node, cluster1-01.

```
cluster1::> storage tape trace -node cluster1-01 -is-trace-enabled true
```

storage tape alias commands

Manage tape device aliases

storage tape alias clear

Clear alias names

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command clears alias names for a tape drive or media changer.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the node to which the tape drive is attached.

{ -name <text> - Alias Name That Is to Be Cleared

Use this parameter to specify the alias name that is to be cleared. You can use the 'storage tape show -alias' command to find more information about alias names of tape drives and media changers attached to a node. The *-clear-scope* and *-name* parameters are mutually exclusive. If you specify the *-name* parameter, a single alias name is cleared.

| -clear-scope {tape|media-changer|all}} - Scope of Alias Clear Operation

Use this parameter to specify the scope of the alias clear operation. The *-clear-scope* and *-name* parameters are mutually exclusive. If you specify the *-clear-scope* parameter, multiple aliases are cleared depending upon the value of the parameter.

The possible values for *-clear-scope* are as follows:

- *tape* - Clear all tape drive aliases
- *media-changer* - Clear all media-changer aliases
- *all* - Clear both tape drive and media-changer aliases

Examples

The following example clears an alias name 'st3' attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -name st3
```

The following example clears all tape drive alias names attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -clear-scope tape
```

The following example clears all media changer alias names attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -clear-scope media-changer
```

The following example clears both tape and media changer alias names attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -clear-scope all
```

storage tape alias set

Set an alias name for tape drive or media changer

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command sets an alias name for a tape drive or media changer.

Parameters

-node {<nodename>|local} - **Node**

Use this parameter to specify the node to which the tape drive is attached.

-name <text> - **Alias Name for Tape Drive or Media Changer**

Use this parameter to specify the alias name for tape drive or media changer. For a tape drive alias name, the format is 'st' followed by one or more digits. For a media changer alias name, the format is 'mc' followed by one or more digits.

-mapping <text> - **Mapping for Alias Name**

Use this parameter to specify the mapping for an alias name. Use the format 'SN[<serial-number>]'. Valid mapping for serial numbers are in the format 'SN[<serial-number>]' where the <serial-number> is from 2 to 90 characters long and includes the following characters: 0-9, a-z, and A-Z.

Examples

The following example sets an alias name 'st3' for a tape drive with serial number SN[123456]L4 attached to the node, node1.

```
cluster1::storage tape alias> set -node node1 -name st3 -mapping SN[123456]L4.
```

The following example sets an alias name 'mc1' for a media changer with serial number SN[65432] attached to the node, node1.

```
cluster1::storage tape alias> set -node node1 -name mc1 -mapping SN[65432].
```

storage tape alias show

Displays aliases of all tape drives and media changers

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays aliases of all tape drives and media changers attached to every node in the cluster.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

Examples

The following example shows the aliases of all tape drives and media changers attached to every node in the cluster:

```
cluster1::> storage tape alias show
```

Node: node1

Alias	Mapping
-----	-----
mc0	SN[00FRU7800000_LL0]L1
mc1	SN[00FRU7800000_LL1]L1
mc2	SN[aa6a64c69360a0980248c8]
mc3	SN[c940abe8b0c3a0980248c8]
mc4	SN[fba082e6b335a0980248c8]L5
st0	SN[HU19487T7N]
st1	SN[1068000230]
st10	SN[fba0c508b335a0980248c8]L7

Node: node2

Alias	Mapping
-----	-----
mc1	SN[c940982fc48c8]
st3	SN[ST456HT8N]L3
st2	SN[HG68000230]L2
st11	SN[aba673980248c8]L7

storage tape config-file commands

Manage tape configuration files

storage tape config-file delete

Delete a tape config file

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `storage tape config-file delete` command deletes the specified tape drive configuration file from all nodes that are currently part of the cluster.

Parameters

-filename <text> - Config File Filename

This parameter specifies the name of the tape configuration file that will be deleted from all nodes that are currently part of the cluster.

Examples

The following example deletes the specified tape drive configuration files on every node that is currently part of the cluster:

```
cluster1::> storage tape config-file delete -filename XYZ_LTO-6.TCF
```

storage tape config-file get

Get a tape drive configuration file

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage tape config-file get` command uploads a specified tape drive configuration file to each node that is currently part of the cluster.

Parameters

-url <text> - Config File URL

This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP and TFTP, are accepted.

Examples

The following example uploads the specified tape drive configuration file to each node that is currently part of the cluster:

```
cluster1::> storage tape config-file get -url http://example.com/~tapeconfigfile/XYZ_LT0-6.TCF
```

storage tape config-file show

Display the list of tape drive configuration files on the given node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage tape config-file show` command lists the tape drive configuration files loaded onto each node in the cluster.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects information about tape drive configuration files for the specified node.

[-config-file <text>] - Tape Config File

Selects information about the tape drive configuration file specified.

Examples

The following example lists the tape drive config files loaded onto each node in the cluster:

```
cluster1::> storage tape config-file show
```

```
Node: node1
```

```
Tape Config Files
```

storage tape library commands

View connectivity of tape libraries in cluster

storage tape library config commands

View configuration of tape LUNs attached to tape libraries

storage tape library config show

Display connectivity to back-end storage tape libraries.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays information such as how the storage tape libraries connect to the cluster, LUN groups, number of LUNs, WWPN, and switch port information. Use this command to verify the cluster's storage tape library configuration or to assist in troubleshooting.

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-switch]

If you specify this parameter, switch port information is shown.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Controller Name

The name of the clustered node for which information is being displayed.

[-group <integer>] - LUN Group

A LUN group is a set of LUNs that shares the same path set.

[-target-wwpn <text>] - Library Target Ports

The World Wide Port Name of a storage tape library port.

[-initiator <text>] - Initiator

The host bus adapter that the clustered node uses to connect to storage tape libraries.

[-array-name <array name>] - Library Name

Name of the storage tape library that is connected to the clustered node.

[-target-side-switch-port <text>] - Target Side Switch Port

This identifies the switch port that connects to the tape library's target port.

[-initiator-side-switch-port <text>] - Initiator Side Switch Port

This identifies the switch port that connects to the node's initiator port.

[-lun-count <integer>] - Number of LUNS

This is a command-line switch (-lun-count) used to restrict what LUN groups are displayed in the output.

Examples

The following example displays the storage tape library configuration information.

```
cluster1::> storage tape library config show
Node      LUN  LUN
          Group Count      Library Name      Library Target Port Initiator
-----
cluster1-01      0      2      TAPE_LIB_1      50050763124b4d6f      3d

cluster1::>
```

storage tape library path commands

View connectivity of tape libraries in cluster

storage tape library path show

Display a list of Tape Libraries on the given path

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays path information for a tape library and has the following parameters by default:

- Node name
- Initiator port
- Target port
- TPGN (Target Port Group Number)
- Port speeds
- Path I/O in Kbytes/sec
- IOPs

Parameters

{ **[-fields <fieldname>, ...]**
fields used to be used in this display

| **[-detail]**
Using this option displays the following:

- Target IOPs
- Target LUNs
- Path IOPs
- Path errors
- Path quality
- Path LUNs
- Initiator IOPs
- Initiator LUNs

| **[-instance]**
If you specify the *-instance* parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Controller name

The name of the clustered node for which information is being displayed.

[-array-name <array name>] - Library Name

Name of the storage tape library that is connected to the cluster.

[-target-wwpn <text>] - Target Port

Target World Wide Port Name. Port on the storage tape library that is being used.

[-initiator <text>] - Initiator Port

Initiator port that the clustered node uses.

[-initiator-side-switch-port <text>] - Initiator Side Switch Port

Switch port connected to the clustered node.

[-tpgn <integer>] - Target Port Group Number

TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

[-port-speed <text>] - Port Speed

Port Speed of the specified port.

[-path-io-kbps <integer>] - Kbytes of I/O per second on Path(Rolling Average)

Rolling average of Kbytes of I/O per second on the library path.

[-path-iops <integer>] - Number of I/O per second on Path(Rolling Average)

Rolling average of I/O per second on the library path.

[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator(Rolling Average)

Rolling average of Kbytes of I/O per second on the initiator port.

[-initiator-iops <integer>] - Number of I/O per second on Initiator(Rolling Average)

>Rolling average of I/O per second on the initiator port.

[-target-io-kbps <integer>] - Kbytes of I/O per second to Target(Rolling Average)

Rolling average of Kbytes of I/O per second on the target port.

[-target-iops <integer>] - Number of I/O per second to Target(Rolling Average)

Rolling average of I/O per second on the target port.

[-target-side-switch-port <text>] - Target Side Switch Port

Switch port connected to the tape library.

[-path-link-errors <integer>] - Link Error count on path

Fibre Channel link error count.

[-path-quality <integer>] - Percentage of weighted error threshold

A number representing the threshold of errors that is allowed on the path. Path quality is a weighted error value. When the error weight of a path exceeds the threshold, I/O is routed to a different path.

[-path-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this path

Number of LUNs on this path.

[-initiator-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this initiator

Number of LUNs on this initiator.

[-target-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this target

Number of LUNs on this target.

Examples

The following example displays the path information for a storage tape library

```
cluster1::> storage tape library path show
Node      Initiator  Target Port      TPGN   Speed      (KB/s)      IOPs
-----
cluster1-01      3d      50050763124b4d6f      61   4 Gb/s      0           0
cluster1-01
```

cluster1-01	0b	510a09800000412d	35	4 Gb/S	0	0
	0b	510a09820000412d	1	4 Gb/S	0	0

3 entries were displayed.

storage tape library path show-by-initiator

Display a list of LUNs on the given tape library

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays path information for every initiator port connected to a tape library. The output is similar to the storage library path show command but the output is listed by initiator.

Parameters

{ [-fields <fieldname>, ...]

fields used to be used in this display

| [-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Controller name

The name of the clustered node for which information is being displayed.

[-initiator <text>] - Initiator Port

Initiator port that the clustered node uses.

[-target-wwpn <text>] - Target Port

Target World Wide Port Name. Port on the storage tape library that is being used.

[-initiator-side-switch-port <text>] - Initiator Side Switch Port

Switch port connected to the clustered node.

[-target-side-switch-port <text>] - Target Side Switch Port

Switch port connected to the tape library.

[-array-name <array name>] - Library Name

Name of the storage tape library that is connected to the cluster.

[-tpgn <integer>] - Target Port Group Number

TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

[-port-speed <text>] - Port Speed

Port Speed of the specified port.

[-path-io-kbps <integer>] - Kbytes of I/O per second on Path (Rolling Average)

Rolling average of Kbytes of I/O per second on the library path.

[-path-iops <integer>] - Number of I/O per second on Path (Rolling Average)

Rolling average of I/O per second on the library path.

[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator (Rolling Average)

Rolling average of Kbytes of I/O per second on the initiator port.

[-initiator-iops <integer>] - Number of I/O per second on Initiator (Rolling Average)

>Rolling average of I/O per second on the initiator port.

[-target-io-kbps <integer>] - Kbytes of I/O per second to Target (Rolling Average)

Rolling average of Kbytes of I/O per second on the target port.

[-target-iops <integer>] - Number of I/O per second to Target (Rolling Average)

Rolling average of I/O per second on the target port.

Examples

The following example displays the path information by initiator for a storage tape library.

```
cluster1::> storage tape library path show-by-initiator
```

```
Node: cluster1-01
```

Initiator	Initiator I/O (KB/s)	Initiator Side Switch Port	Path I/O (KB/s)	Target Side Switch Port	Target I/O (KB/s)	Target Port	Library Name
0b	0	sw_tape:6	0	sw_tape:0	0	510a09800000412d	TAPE_LIB_1
3d	0	N/A	0	sw_tape:1	0	510a09820000412d	TAPE_LIB_1
3				N/A	0	50050763124b4d6f	TAPE_LIB_2

3 entries were displayed.

storage tape load-balance commands

Manage tape load balance

storage tape load-balance modify

Modify the tape load balance configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage tape load-balance modify` command modifies the tape load balance setting for a specified node in the cluster.

Parameters

-node {<nodename>|local} - Node

This parameter specifies the node on which the tape load balance setting is to be modified.

[-is-enabled {true|false}] - Is Tape Load Balance Enabled

This parameter specifies whether tape load balancing is enabled on the node. The default setting is false.

Examples

The following example modifies the tape load balance setting on node1 in the cluster:

```
cluster1::> storage tape load-balance modify -node node1 -is-enabled true
```

storage tape load-balance show

Displays the tape load balance configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage tape load-balance show` command displays tape load balance settings for each node in the cluster.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node`

Selects information about tape load balancing for the specified node.

`[-is-enabled {true|false}] - Is Tape Load Balance Enabled`

Selects information about load balance configuration as specified by enabled or disabled setting.

Examples

The following example shows the load balance setting for each node in the cluster:

```
cluster1::> storage tape load-balance show
```

Node	Enabled
node1	false
node2	false

2 entries were displayed.

Chapter 26. System Commands

The system directory

The `system` commands enable you to monitor and control cluster nodes.

system cluster-switch commands

cluster switch health monitor directory

system cluster-switch create

Add information about a cluster switch or management switch

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system cluster-switch create` command adds information about a cluster switch or management switch. The cluster switch health monitor uses this information to monitor the health of the switch.

Use this command if ONTAP cannot automatically discover a cluster or management switch. ONTAP relies on the Cisco Discovery Protocol (CDP) to discover the switches. CDP is always enabled on all cluster ports of a node by default, disabled on all non-cluster ports of a node. If the CDP is also enabled on your cluster switches, they will be automatically discovered.

If you want ONTAP to discover and monitor management switches, the CDP must be enabled on non-cluster ports. To verify whether the CDP is enabled or disabled, use the command [“system node run” on page 1151](#) `-node <node_name> -command options cdpd.enable`.

Use the [“system cluster-switch show” on page 1055](#) command to identify switches that the cluster switch health monitor is monitoring.

Parameters

-device <text> - Device Name

Specifies the device name of the switch that you want to monitor. Data ONTAP uses the device name of the switch to identify the SNMP agent with which it wants to communicate.

-address <IP Address> - IP Address

Specifies the IP address of switch's management interface.

-snmp-version {SNMPv1|SNMPv2c|SNMPv3} - SNMP Version

Specifies the SNMP version that Data ONTAP uses to communicate with the switch. The default is SNMPv2c.

{ -community <text> - DEPRECATED-Community String or SNMPv3 Username

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use `-community-or-username` instead.

Specifies the community string for SNMPv2 authentication or SNMPv3 user name for SNMPv3 security. The default community string for SNMPv2 authentication is `cshm1!`.

| -community-or-username <text> } - Community String or SNMPv3 Username

Specifies the community string for SNMPv2 authentication or SNMPv3 user name for SNMPv3 security. The default community string for SNMPv2 authentication is `cshm1!`.

-model {*NX5010|NX5020|CAT2960|OTHER|NX5596|CN1610|CN1601|NX3132|NX5548|NX3132V|OT9332|NX3132XL|NX3232C*} - **Model Number**

Specifies the model number of the switch. You should not set this parameter to OTHER. Data ONTAP does not monitor switches that match this value. Data ONTAP sets this parameter to OTHER if a switch that it automatically discovers is not supported for health monitoring.

-type {*cluster-network|management-network*} - **Switch Network**

Specifies the switch type.

[-is-monitoring-enabled-admin {*true|false*}] - **Enable Switch Monitoring**

Specifies the switch admin monitoring status.

Examples

```
cluster1::> system cluster-switch create -device SwitchA -address 1.2.3.4 -snmp-version SNMPv2c -community-or-username cshm1! -model NX5596
Creates a new switch configuration for a switch named SwitchA.
```

```
cluster2::> system cluster-switch create -device SwitchB -address 5.6.7.8 -snmp-version SNMPv3 -community-or-username snmpv3u1 -model CN1601
```

system cluster-switch delete

Delete information about a cluster switch or management switch

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system cluster-switch delete` command disables switch health monitoring for a cluster or management switch.

Parameters

-device <*text*> - **Device Name**

Specifies the name of the switch.

[-force [*true*]] - **Force Delete (privilege: advanced)**

Specifies if force delete or not.

Examples

```
cluster1::> system cluster-switch delete -device SwitchA
Disables monitoring for the switch named SwitchA.
cluster1::> system cluster-switch delete -device SwitchA -force
```

system cluster-switch modify

Modify information about a switch's configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system cluster-switch modify` command modifies information about a cluster switch or management switch. The cluster switch health monitor uses this information to monitor the switch.

Parameters

-device <*text*> - **Device Name**

Specifies the device name of switch that you want to monitor.

[-address <*IP Address*>] - **IP Address**

Specifies the IP address of switch's management interface.

[-snmp-version {*SNMPv1|SNMPv2c|SNMPv3*}] - **SNMP Version**

Specifies the SNMP version that Data ONTAP uses to communicate with the switch. The default is SNMPv2c.

{ **[`-community` <text>]** - **DEPRECATED-Community String or SNMPv3 Username**

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use `-community-or-username` instead.

Specifies the community string for SNMPv2 authentication or SNMPv3 username for SNMPv3 security.

| **[`-community-or-username` <text>]]** - **Community String or SNMPv3 Username**

Specifies the community string for SNMPv2 authentication or SNMPv3 username for SNMPv3 security.

[`-type` {*cluster-network*|*management-network*}] - **Switch Network**

Specifies the switch type.

[`-is-monitoring-enabled-admin` {*true*|*false*}] - **Enable Switch Monitoring**

Specifies the switch admin monitoring status.

Examples

```
cluster1::> system cluster-switch modify -device SwitchA -address 2.3.4.5
```

Modifies the IP address for the switch named SwitchA.

```
cluster1::> system cluster-switch modify -device SwitchB -snmp-version SNMPv3 -community-or-username snmpv3u1
```

system cluster-switch prepare-to-downgrade

Remove unsupported switches in preparation for downgrade

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system cluster-switch prepare-to-downgrade` command changes switch information, so that it is compatible with older versions of ONTAP. When executed, it removes cluster switch entries that are not supported in versions earlier than ONTAP 9.1.

Examples

system cluster-switch show

Display the configuration for cluster and management switches

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system cluster-switch show` command displays configuration details for the monitored cluster switches and management switches.

Parameters

{ **[`-fields` <fieldname>, ...]**

Selects the fields that have the specified name.

| **[`-snmp-config`]**

Displays the following information about a switch:

- Device Name
- SNMPv2c Community String or SNMPv3 Username

- SNMP Version

[-status]

Displays the following status information about a switch:

- Is Discovered
- SNMPv2c Community String or SNMPv3 Username
- Model Number
- Switch Network
- Software Version
- Reason For Not Monitoring
- Source Of Switch Version
- Is Monitored ?

[-instance]

Selects detailed information for all the switches.

[-device <text>] - Device Name

Selects the switches that match the specified device name.

[-address <IP Address>] - IP Address

Selects the switches that match the specified IP address.

[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version

Selects the switches that match the specified SNMP version.

[-is-discovered {true|false}] - Is Discovered

Selects the switches that match the specified discovery setting.

[-community <text>] - DEPRECATED-Community String or SNMPv3 Username

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use `-community-or-username` instead.

Selects the switches that match the specified SNMPv2c community string or SNMPv3 username.

[-community-or-username <text>] - Community String or SNMPv3 Username

Selects the switches that match the specified SNMPv2c community string or SNMPv3 username.

[-model {NX5010|NX5020|CAT2960|OTHER|NX5596|CN1610|CN1601|NX3132|NX5548|NX3132V|OT9332|NX3132XL|NX3232C}] - Model Number

Selects the switches that match the specified model number.

[-type {cluster-network|management-network}] - Switch Network

Selects the switches that match the specified switch type.

[-sw-version <text>] - Software Version

Selects the switches that match the specified software version.

[-reason <text>] - Reason For Not Monitoring

Selects the switches that match the specified reason.

[-version-source <text>] - Source Of Switch Version

Selects the switches that match the specified version source (for example, from SNMP, CDP or ISDP).

[-is-monitoring-enabled-operational {true|false}] - Is Monitored ?

Selects the switches that match the specified operational monitoring status.

[-serial-number <text>] - Serial Number of the Device

Selects the switches that match the specified serial number.

Examples

```
cluster1::> system cluster-switch show
Switch                Type                Address                Model
-----
cn1610-143--234      cluster-network    10.238.143.234      CN1610
  Serial Number: 20211200007
  Is Monitored: true
  Reason:
  Software Version: 1.1.0.1
  Version Source: ISDP

cn1601--143-230      management-network 10.238.143.230      CN1601
  Serial Number: 20210200019
  Is Monitored: false
  Reason: Monitoring Disabled by Default
  Software Version: 1.1.0.1
  Version Source: ISDP

cn1601--143-232      management-network 10.238.143.232      CN1601
  Serial Number: 20210200017
  Is Monitored: false
  Reason: Monitoring Disabled by Default
  Software Version: 1.1.0.1
  Version Source: ISDP

cn1610-143--231      cluster-network    10.238.143.231      CN1610
  Serial Number: 20211200002
  Is Monitored: true
  Reason:
  Software Version: 1.1.0.1
  Version Source: ISDP
```

The example above displays the configuration of all cluster switches and management switches.

```
cluster1::> system cluster-switch show -snmp-config
Switch                SNMPv2c Community
or SNMPv3 Username    SNMP Version
-----
SwitchA                public                SNMPv2c
```

system cluster-switch show-all

Displays the list of switches that were added and deleted

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system cluster-switch show-all` command displays configuration details for discovered monitored cluster switches and management switches, including switches that are user-deleted. From the list of deleted switches, you can delete a switch permanently from the database to re-enable automatic discovery of that switch.

Parameters

{ [-fields <fieldname>, ...]

Selects the fields that have the specified name.

| [-instance]}

Selects detailed information for all the switches.

[-device <text>] - Device Name

Selects the switches that match the specified device name.

[-address <IP Address>] - IP Address

Selects the switches that match the specified IP address.

[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version

Selects the switches that match the specified SNMP version.

[-community <text>] - DEPRECATED-Community String or SNMPv3 Username

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use `-community-or-username` instead.

Selects the switches that match the specified community string or SNMPv3 username.

[-community-or-username <text>] - Community String or SNMPv3 Username

Selects the switches that match the specified community string or SNMPv3 username.

[-discovered {true|false}] - Is Discovered

Selects the switches that match the specified discovery setting.

[-model {NX5010|NX5020|CAT2960|OTHER|NX5596|CN1610|CN1601|NX3132|NX5548|NX3132V|OT9332|NX3132XL|NX3232C}] - Model Number

Selects the switches that match the specified model number.

[-type {cluster-network|management-network}] - Switch Network

Selects the switches that match the specified switch type.

[-sw-version <text>] - Software Version

Selects the switches that match the specified software version.

[-is-monitoring-enabled-operational {true|false}] - Switch Monitoring Status

Selects the switches that match the specified operational monitoring status.

[-reason <text>] - Reason For Not Monitoring

Selects the switches that match the specified reason.

[-version-source <text>] - Source Of Switch Version

Selects the switches that match the specified version source (for example, from SNMP, CDP or ISDP).

[-serial-number <text>] - Serial Number of the Device

Selects the switches that match the specified serial number.

Examples

```
cluster1::> system cluster-switch show-all
Switch                Type                Address        Model
-----
SwitchA               cluster           1.2.3.4        Nexus5010

    Is Monitored: yes
      Reason:
Software Version: Cisco IOS 4.1N1
Version Source: CDP
```

system cluster-switch log commands

The log directory

system cluster-switch log collect

Collect cluster switch log

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system cluster-switch log collect` command initiates the collection of a cluster switch log for the specified cluster switch.

Parameters

-device <text> - Switch Name

Specifies the cluster switch device for which the log collection is being made.

Examples

```
cluster1::> system cluster-switch log collect -device cluster-sw1
```

system cluster-switch log disable-collection

Disable cluster switch log collection

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system cluster-switch log disable-collection` command disables the collection of cluster switch logs.

Examples

```
cluster1::> system cluster-switch log disable-collection
```

system cluster-switch log enable-collection

Enable cluster switch log collection

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system cluster-switch log enable-collection` command enables the collection of cluster switch logs.

Examples

```
cluster1::> system cluster-switch log enable-collection
```

system cluster-switch log modify

Modify the cluster switch log request

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system cluster-switch log modify` command modifies the log request of the specified cluster switch.

Parameters

-device <text> - Switch Name

Specifies the cluster switch device for which the log request is being made. Note, that the device must be one of the devices listed as a cluster switch from the `system cluster-switch show` command. The full device name from the `system cluster-switch show` command must be used.

[-log-request {true|false}] - Requested Log

Specifies the initiation of a switch log retrieval for the specified cluster switch if set to true.

Examples

```
cluster1::> system cluster-switch log modify -device switch-name01(Switch---SN) -log-request true
```

system cluster-switch log setup-password

Obtain cluster switch admin passwords

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system cluster-switch log setup-password` command allows the user to enable the cluster switch health monitor to setup access to certain cluster switches so that the switch logs can be collected.

Examples

```
cluster1::> system cluster-switch log setup-password
Enter the switch name: (use full name from system cluster-switch show)
Enter the password: (Enter admin password of switch)
Enter the password again: (Enter admin password of switch)
cluster1::>
```

system cluster-switch log show

Displays cluster switch log information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system cluster-switch log show` command displays the status and requests for cluster switch logs.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

Specifies an instance of the cluster switch devices log status.

[-device <text>] - Switch Name

Specifies the name of the cluster switch device to display log status on.

[-log-request {true|false}] - Requested Log

Specifies the state of the log request for a cluster switch device. Values: true, false.

[-log-status <text>] - Log Status

Specifies the status of the log request for a cluster switch device.

[-log-timestamp <MM/DD/YYYY HH:MM:SS>] - Log Timestamp

Specifies the completion timestamp of the log request for a cluster switch device.

[-idx <integer>] - Index

Specifies the index of the cluster switch device.

[-filename <text>] - Filename

Specifies the full filename of the cluster switch log.

[-filenode <text>] - File Node

Specifies the name of the controller on which the cluster switch log resides.

Examples

```
cluster1::> system cluster-switch log show
```

Log Collection Enabled: true

Index	Switch	Log Timestamp	Status
1	switch-name01(Switch---SN)	-	-
2	switch-name02(Switch---SN)	-	-

system cluster-switch polling-interval commands

The polling-interval directory

system cluster-switch polling-interval modify

Modify the polling interval for monitoring cluster and management switch health

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system cluster-switch polling-interval modify` command modifies the interval in which the cluster switch health monitor polls cluster and management switches.

Parameters

[-polling-interval <integer>] - Polling Interval

Specifies the interval in which the health monitor polls switches. The interval is in minutes. The default value is 5. The allowed range of values is 2 to 120.

Examples

```
cluster1::> system cluster-switch polling-interval modify -polling-interval 41
```

system cluster-switch polling-interval show

Display the polling interval for monitoring cluster and management switch health

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system cluster-switch polling-interval show` command displays the polling interval used by the health monitor.

Examples

```
cluster1::> system cluster-switch polling-interval show
Polling Interval (in minutes): 40
```

system cluster-switch threshold commands

The threshold directory

system cluster-switch threshold show

Display the cluster switch health monitor alert thresholds

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system cluster-switch threshold show` command displays thresholds used by health monitor alerts.

Examples

```
cluster1::> system cluster-switch threshold show
Per 0.10% values: 1 = 0.10%, 5 = 0.50%
In Errors Threshold (%) Out Errors Threshold (%)
-----
                        1                        1
```

system chassis commands

Chassis health monitor directory

system chassis show

Display all the chassis in the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system chassis show` command displays information about all the chassis in the cluster. By default, the command displays the following information about all the chassis in the cluster:

- Chassis ID
- Status
- List of nodes in the chassis

To display more details, use the `-instance` parameter.

Parameters

{ **[-fields <fieldname>, ...]**

Selects the fields that you specify.

| **[-instance]**

Displays detailed information about all the chassis in the cluster.

[-chassis-id <text>] - Chassis ID

Selects information about the specified chassis.

[-member-nodes {<nodename>|local}, ...] - List of Nodes in the Chassis

Selects information about the chassis with the specified member node list.

[-num-nodes <integer>] - Number of Nodes in the Chassis

Selects information about the chassis with the specified number of nodes.

[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status

Selects information about the chassis with the specified status.

Examples

The following example displays information about all the chassis in the cluster:

```
cluster1::> system chassis show

Chassis ID          Status          List of Nodes
-----
4591227214          ok              node1,node2
```

```
4591227000          ok          node1,node2
```

The following example displays detailed information about a specific chassis:

```
cluster1::> system chassis show -chassis-id 4591227214 -instance
```

```
                Chassis ID: 4591227214
List of Nodes in the Chassis: node1,node2
Number of Nodes in the Chassis: 2
                Status: ok
```

system chassis fru commands

The fru directory

system chassis fru show

Display the FRUs in the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system chassis fru show` command displays information about all the major chassis specific FRUs in the cluster. By default, the command displays the following information about all the FRUs in the cluster:

- Chassis ID
- FRU name
- FRU type
- FRU state
- Nodes sharing the FRU

To display more details, use the `-instance` parameter.

Parameters

{ [-fields <fieldname>, ...]

Selects the fields that you specify.

| [-instance]}

Displays detailed information about FRUs.

[-node {<nodename>|local}] - Node

Specifies the primary node name in the cluster on which Chassis health monitor is running.

[-serial-number <text>] - FRU Serial Number

Selects information about the FRU with the specified serial number.

[-fru-name <text>] - FRU Name

Selects information about the FRU with the specified FRU name.

[-type {controller|psu|fan|dimm|bootmedia|ioxm|nvram|nvdim}] - FRU Type

Selects information about all the FRUs with the specified FRU type.

[-name <text>] - FRU ID

Selects information about the FRU with the specified FRU unique name.

[-state <text>] - FRU State

Selects information about all the FRUs with the specified state.

[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status

Selects information about all the FRUs with the specified status.

[-display-name <text>] - Display Name for the FRU

Selects information about all the FRUs with the specified FRU display name.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Monitor Name

Selects information about all the FRUs with the specified monitor name.

[-model <text>] - Model Type

Selects information about all the FRUs with the specified FRU model.

[-shared {shared|not_shared}] - Shared Resource

Selects information about all the FRUs with the specified sharing type.

[-chassis-id <text>] - Chassis ID

Selects information about all the FRUs in the specified chassis.

[-additional-info <text>] - Additional Information About the FRU

Selects information about all the FRUs with the specified additional information.

[-connected-nodes {<nodename>|local}, ...] - List of Nodes Sharing the FRU

Selects information about all the FRUs with the specified node list.

[-num-nodes <integer>] - Number of Nodes Sharing the FRU

Selects information about all the FRUs with the specified number of connected nodes.

Examples

The following example displays information about all major chassis specific FRUs in the cluster:

```
cluster1::> system chassis fru show
```

Chassis ID	FRU	Type	State	Nodes Sharing the FRU
4591227214	node1	controller	ok	node1
4591227214	node2	controller	ok	node2
4591227214	PSU1 FRU	psu	GOOD	node1,node2
4591227214	PSU2 FRU	psu	GOOD	node1,node2

The following example displays detailed information about a specific FRU:

```
cluster1::> system chassis fru show -instance -fru-name "PSU1 FRU"
```

```

Node: node1
FRU Serial Number: XXT122737891
FRU Name: PSU1 FRU
FRU Type: psu
FRU Name: XXT122737891
FRU State: GOOD
Status: ok
Display Name for the FRU: PSU1 FRU
Monitor Name: chassis
Model Type: none
Shared Resource: shared
Chassis ID: 4591227214
Additional Information About the FRU: Part Number: 114-00065+A0
Revision: 020F
Manufacturer: NetApp
FRU Name: PSU
List of Nodes Sharing the FRU: node1,node2
Number of Nodes Sharing the FRU: 2
```

system controller commands

Controller health monitor directory

system controller show

Display the controller information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller show` command displays information about all the controllers in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about all the controllers in the cluster:

- Controller name
- System ID
- System serial number
- Controller model name
- Health monitor status

To display more details, use the `-instance` parameter.

Parameters

{ [-fields <fieldname>, ...]

Selects the fields that you specify.

| [-instance]]

Displays detailed information about all the controllers in the cluster.

[-node {<nodename>|local}] - Node

Selects information about the specified controller.

[-system-id <text>] - System ID

Selects information about the controller with the specified System ID.

[-model <text>] - Model Name

Selects information about the controllers with the specified model name.

[-part-number <text>] - Part Number

Selects information about the controllers with the specified part number.

[-revision <text>] - Revision

Selects information about the controllers with the specified revision.

[-serial-number <text>] - Serial Number

Selects information about the controller with the specified system serial number.

[-controller-type <text>] - Controller Type

Selects information about the controllers with the specified controller type.

[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status

Selects information about the controllers with the specified health monitor status.

[-chassis-id <text>] - Chassis ID

Selects information about the controllers with the specified chassis ID.

Examples

The below example displays information about all controllers in the cluster.

```
cluster1::> system controller show
Controller Name      System ID      Serial Number    Model    Status
-----
node1                140733730268652  700001456939    FAS2520  ok
node2                140733730268667  700001456941    FAS2520  ok
2 entries were displayed.
```

The example below displays detailed information about specified controller in the cluster.

```
cluster1::> system controller show -instance -node node1
Node: node1
System ID: 140733730268652
Model Name: FAS2520
Part Number: 111-01316
Revision: 21
Serial Number: 700001456939
Controller Type: none
Status: ok
Chassis ID: 4591227214
```

system controller bootmedia commands

The bootmedia directory

system controller bootmedia show

Display the Boot Media Device Health Status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller bootmedia show` command displays details of the bootmedia devices present in all the nodes in a cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the bootmedia:

- Node name
- Display name
- Vendor ID
- Device ID
- Memory size
- Bootmedia state
- Health monitor status

To display more details, use the `-instance` parameter.

Parameters

{ [-fields <fieldname>, ...]

Selects the fields that you specify.

| [-instance]}

Displays detailed information for all the bootmedia devices.

[-node {<nodename>|local}] - Node

Selects the bootmedia device that is present on the specified node.

[-serial-num <text>] - Serial Number

Selects the bootmedia devices with the specified serial number.

[-vendor-id <Hex Integer>] - Vendor ID

Selects the bootmedia devices with the specified vendor ID.

[-device-id <Hex Integer>] - Device ID

Selects the bootmedia devices with the specified device ID.

[-display-name <text>] - Display Name

Selects the bootmedia devices with the specified display name.

[-unique-name <text>] - Unique Name

Selects the bootmedia device with the specified unique name.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name

Selects the bootmedia devices with the specified health monitor.

[-usbmon-status {present|not-present}] - Bootmedia Health Monitor

Selects the bootmedia devices with the specified USBMON status.

[-device-state {good|warn|bad}] - Bootmedia State

Selects the bootmedia devices with the specified device state.

[-size <integer>] - Max Memory Size (MB)

Selects the bootmedia devices with the specified memory size.

[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status

Selects the bootmedia devices with the specified health monitor status.

Examples

The following example displays the information of the bootmedia devices present in all the nodes in a cluster:

```
cluster1::> system controller bootmedia show
```

Node	Display Name	Vendor ID	Device ID	Size (MB)	Bootmedia State	Status
node1	Micron Technology 0x655	634	655	1929	good	ok
node2	Micron Technology 0x655	634	655	1929	good	ok

The example below displays the detailed information about the bootmedia present in a node.

```
cluster1::> system controller bootmedia show -instance -node node1
```

```

Node: node1
Vendor ID: 634
Device ID: 655
Display Name: Micron Technology 0x655
Unique Name: Micron Technology 0x655 (ad.0)
Health Monitor Name: controller
USBMON Health Monitor: present
Bootmedia State: good
Max memory size(in MB): 1929
Status: ok
```

system controller bootmedia show-serial-number

Display the Boot Media Device serial number

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller bootmedia show-serial-number` command displays the Boot Media Device serial number. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the bootmedia:

- Node name
- Display name
- Serial Number

- Size
- Bootmedia state
- Status

To display more details, use the `-instance` parameter.

Parameters

{ [-fields <fieldname>, ...]

Selects the fields that you specify.

[-instance]}

Displays detailed information for all the bootmedia devices.

[-node {<nodename>|local}] - Node

Selects the bootmedia device that is present on the specified node.

[-serial-num <text>] - Serial Number

Selects the bootmedia devices with the specified serial number.

[-vendor-id <Hex Integer>] - Vendor ID

Selects the bootmedia devices with the specified vendor ID.

[-device-id <Hex Integer>] - Device ID

Selects the bootmedia devices with the specified device ID.

[-display-name <text>] - Display Name

Selects the bootmedia devices with the specified display name.

[-unique-name <text>] - Unique Name

Selects the bootmedia device with the specified unique name.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name

Selects the bootmedia devices with the specified health monitor.

[-usbmon-status {present|not-present}] - Bootmedia Health Monitor

Selects the bootmedia devices with the specified USBMON status.

[-device-state {good|warn|bad}] - Bootmedia State

Selects the bootmedia devices with the specified device state.

[-size <integer>] - Max Memory Size (MB)

Selects the bootmedia devices with the specified memory size.

[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status

Selects the bootmedia devices with the specified health monitor status.

Examples

The following example displays the information of the bootmedia devices present in all the nodes in a cluster:

```
cluster1::> system controller bootmedia show-serial-number
```

Node	Display Name	Serial Number	(MB) State	Status
or-12-01	BootMedia/SAMSUNG	S2J4NXAGA08186	122104 good	ok
	MZVLV128HCGR-00000			
	BootMedia-2/SAMSUNG	S2J4NXAGA08198	122104 good	ok
	MZVLV128HCGR-00000			

2 entries were displayed.

The following example displays the detailed information about the bootmedia present in a node:

```
cluster1::> system controller bootmedia show-serial-number -instance -node node1
```

```
Node: node1
Vendor ID: 8086
```

```
Device ID: 8d02
Display Name: TOSHIBA THNSNJ060GMCU
Unique Name: /dev/ad4s1 (TOSHIBA THNSNJ060GMCU)
Health Monitor Name: controller
Bootmedia Health Monitor: present
Bootmedia State: good
Max memory size(in MB): 16367
Status: ok
Serial number: Y4IS104FTNEW
```

system controller clus-flap-threshold commands

The clus-flap-threshold directory

system controller clus-flap-threshold show

Display the controller cluster port flap threshold

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller clus-flap-threshold show` command allows the display of the threshold for link flapping counts for all nodes. This threshold would be the number of times the cluster port links for a given node can flap (go down) within a polling period before triggering an alert.

system controller config commands

Configuration information directory

system controller config show

Display System Configuration Information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller config show` command displays system configuration information for the devices present in the controller. To display more details, use the `-instance` parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the nodes that match this parameter value.

[-device <text>] - Device

Selects the configuration information that matches the specified device.

[-slot <integer>] - Slot Number

Selects the configuration information that matches the specified slot.

[-subslot <integer>] - Subslot Number

Selects the configuration information that matches the specified subslot.

[-info <text>] - Device Info

Selects the configuration information that matches the specified device information.

Examples

The following example displays configuration information for slot 1 of the controller:

```
cluster1::> system controller config show -slot 1

Node: node1

Sub- Device/
Slot slot Information
-----
1  - NVRAM10 HSL
    Device Name:      Interconnect HBA: Generic OFED Provider
    Port Name:        ib1a
    Default GUID:     fe80:0000:0000:0000:0000:0000:0104
    Base LID:         0x104
    Active MTU:       8192
    Data Rate:        0 Gb/s (8X)
    Link State:       DOWN
    QSFP Vendor:      Amphenol
    QSFP Part Number: 112-00436+A0
    QSFP Type:        Passive Copper 1m ID:00
    QSFP Serial Number: APF16130066875
    QSFP Vendor:      Amphenol
    QSFP Part Number: 112-00436+A0
    QSFP Type:        Passive Copper 1m ID:00
    QSFP Serial Number: APF16130066857

cluster1::>
```

system controller config show-errors

Display configuration errors

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller config show-errors` displays configuration errors.

- node
- description

To display more details, use the `-instance` parameter.

Parameters

{ [-fields <fieldname>, ...]

Selects the fields that you specify.

| [-instance]}

Displays detailed information for all the PCI devices.

[-node {<nodename>|local}] - Node

Displays configuration errors on the specified node.

[-verbose [true]] - Verbose Output?

The `-verbose` parameter enables verbose mode, resulting in the display of more detailed output.

[-description <text>] - Error Description

Displays the node with the specified configuration error.

Examples

The example below displays configuration errors on all the nodes in the cluster.

```
cluster1::> system controller config show-errors

Configuration Info and Errors for Node: cluster1-01
```

```

-----
Chelsio T320E 2x10G NIC card (PN X1008A) in slot 1 is not supported on model FAS3210
Configuration Info and Errors for Node: cluster1-02
-----
PCI-E Dual 10/100/1000 Ethernet G20 card (PN X1039A) in slot 2 is not supported on model FAS3210

cluster1::>

cluster1::> system controller config show-errors -verbose

Configuration Info and Errors for Node: cluster1-01
-----
sysconfig: Card in slot 2 (7-1275-0008-46848) is not supported.
sysconfig: slot 12 OK: X2067: Proprietary embedded SAS HBA

cluster1::>

```

system controller config pci commands

PCI device information directory

system controller config pci show-add-on-devices

Display PCI devices in expansion slots

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller config pci show-add-on-devices` command displays information about the PCIe devices in I/O expansion slots. The command displays the following information about the PCIe devices:

- Node
- Model
- Type
- Slot
- Device
- Vendor
- Sub-device ID

To display more details, use the `-instance` parameter.

Parameters

{ [-fields <fieldname>, ...]

Selects the fields that you specify.

| [-instance]}

Displays detailed information about PCI devices.

[-node {<nodename>|local}] - Node

Selects the PCI devices that are present in the specified node.

[-model <text>] - Model String

Selects the PCI devices that are present on the system with the specified model name.

[-type <integer>] - Device Type

Selects the PCI devices with the specified device type.

[-slot-and-sub <text>] - PCI Slot Number

Selects the PCI devices present in the specified slot or slot-subslot combination.

[-device <text>] - Device

Selects the PCI devices with the specified device ID.

[-vendor <text>] - Vendor Number

Selects the PCI devices with the specified vendor ID.

[-sub-device-id <integer>] - Sub Device ID

Selects the PCI devices with the specified sub-device ID.

Examples

The example below displays information about PCI devices found in I/O expansion slots of all the nodes in the cluster.

```
cluster1::> system controller config pci show-add-on-devices
Node           Model           Slot Type Device  Vendor Sub-Device ID
-----
cluster1-01    FAS6240
               6      7  0x2532 0x1077      10
               5      1  0x1527 0x8086       0
               2      7  0x6732 0x15B3       0
               3      1  0x8030 0x1077       0
               1      2  0x8001 0x11F8       0
               15     1  0x10FB 0x8086       0
               13     1  0x150E 0x8086       1
               7      1  0x1528 0x8086       0
cluster1-02    FAS6240
               6      7  0x2532 0x1077      10
               5      1  0x1527 0x8086       0
               2      7  0x6732 0x15B3       0
               3      1  0x8030 0x1077       0
               1      2  0x8001 0x11F8       0
               15     1  0x10FB 0x8086       0
               13     1  0x150E 0x8086       1
               7      1  0x1528 0x8086       0
```

16 entries were displayed.

```
cluster1::>
```

system controller config pci show-hierarchy

Display PCI hierarchy

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller config pci show-hierarchy` command displays the PCI Hierarchy of all PCI devices found in a controller. The command displays the following information about the PCI devices:

- Node
- Level
- Device
- Link Capability
- Link Status

To display more details, use the `-instance` parameter.

Parameters

{ **[-fields <fieldname>, ...]**

Selects the fields that you specify.

| **[-instance]**

Displays detailed information for PCI devices.

[-node {<nodename>|local}] - Node

Displays the PCI hierarchy of the specified node.

[-level <integer>] - PCI Device Level

Displays the PCI devices that match the specified level within the PCI hierarchy.

[-pci-device <text>] - PCI Device

Displays the PCI devices that match the specified device description.

[-link-cap <text>] - Link Capability

Displays the PCI devices that match the specified link capability.

[-link-status <text>] - Link Status

Displays the PCI devices that match the specified link status.

Examples

The example below displays the PCI hierarchy for all of the nodes in the cluster.

```
cluster1:> system controller config pci show-hierarchy
PCI Hierarchy

Node: cluster1-01

system controller environment commands

The environment directory

system controller environment show

Display the FRUs in the controller

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller environment show` displays information about all environment FRUs in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the environment FRUs in the cluster:

- Node
- FRU name
- FRU state

To display more details, use the `-instance` parameter.

Parameters

{ **[-fields** <fieldname>, ...]

Selects the fields that you specify.

[-instance]

Displays detailed information about the environment FRUs.

[-node {<nodename>|local}] - Node

Selects information about all the environment FRUs that the specified node owns.

[-serial-number <text>] - FRU Serial Number

Selects information about all the environment FRUs with the specified serial number.

[-fru-name <text>] - FRU Name

Selects information about the environment FRU with the specified FRU name.

[-type {controller|psu|fan|dimm|bootmedia|ioxm|nvram|nvdimm}] - FRU Type

Selects information about all the environment FRUs with the specified FRU type.

[-name <text>] - Name

Selects information about all the environment FRUs with the specified unique name.

[-state <text>] - FRU State

Selects information about all the environment FRUs with the specified FRU state.

[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status

Selects information about all the environment FRUs with the specified health monitor status.

[-display-name <text>] - Display Name for the FRU

Selects information about all the environment FRUs with the specified display name.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Monitor Name

Selects information about all the environment FRUs with the specified monitor.

[-model <text>] - Model Type

Selects information about all the environment FRUs with the specified FRU model.

[-shared {shared|not_shared}] - Shared Resource

Selects information about all the environment FRUs with the specified sharing type.

[-chassis-id <text>] - Chassis ID

Selects information about all the environment FRUs in the specified chassis.

[-additional-info <text>] - Additional Information About the FRU

Selects information about all the environment FRU with specified additional information.

[-seq-state-cnt <integer>] - Count of Same State

Selects information about all the environment FRU with specified sequential state count.

Examples

The following example displays information about all major environment FRUs in the cluster:

```
cluster1::> system controller environment show
```

Node	FRU Name	State
node1	PSU1 FRU	GOOD
node1	PSU2 FRU	GOOD
node2	PSU1 FRU	GOOD
node2	PSU2 FRU	GOOD

The following example displays detailed information about a specific environment FRU:

```
cluster1::> system controller environment show -node node1 -fru-name "PSU1 FRU" -instance
```

```

Node: node1
FRU Serial Number: XXT122737891
FRU Name: PSU1 FRU
FRU Type: psu
Name: XXT122737891
FRU State: GOOD
Status: ok
Display Name for the FRU: PSU1 FRU
Monitor Name: controller
Model Type: none
Shared Resource: shared
Chassis ID: 4591227214
Additional Information About the FRU: Part Number: 114-00065+A0
Revision: 020F
Manufacturer: NetApp
FRU Name: PSU

```

system controller flash-cache commands

The flash-cache directory

system controller flash-cache show

Display the Flash Cache device status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller flash-cache show` command displays the current Flash Cache device information.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

If this parameter is specified, only status information for the matching node is displayed.

[-slot <integer>] - Slot

If this parameter is specified, only status information for the matching slot is displayed.

[-subslot <integer>] - Subslot

If this parameter is specified, only status information for the matching subslot is displayed.

[-slot-string <text>] - Slot String

If this parameter is specified, only status information for the matching slot is displayed. Format can be slot or slot-subslot.

[-device-state {ok|erasing|erased|failed|removed|online|offline_failed|degraded|offline_threshold}] - Device State

If this parameter is specified, only status information for the matching device-state is displayed.

[-model-number <text>] - Model Number

If this parameter is specified, only status information for the matching model-number is displayed.

[-part-number <text>] - Part Number

If this parameter is specified, only status information for the matching part-number is displayed.

[-serial-number <text>] - Serial Number

If this parameter is specified, only status information for the matching serial-number is displayed.

[-firmware-version <text>] - Firmware Version

If this parameter is specified, only status information for the matching firmware-version is displayed.

[-hardware-revision <text>] - Hardware Revision

If this parameter is specified, only status information for the matching hardware-revision is displayed.

[-capacity <integer>] - Capacity

If this parameter is specified, only status information for the matching capacity is displayed.

[-last-change-time <integer>] - Time Last State Change

If this parameter is specified, only status information for the matching last-change-time is displayed.

[-service-time <integer>] - Service Time

If this parameter is specified, only status information for the matching service-time is displayed.

[-percent-online <integer>] - Percent Online

If this parameter is specified, only status information for the matching percent-online is displayed.

[-average-erase-cycle-count <integer>] - Avg Erase Cycle Count

If this parameter is specified, only status information for the matching average-erase-cycle-count is displayed.

[-threshold-profile <text>] - Threshold Profile

If this parameter is specified, only status information for the matching threshold-profile is displayed.

Examples

The following example displays the current state of all Flash Cache devices:

```
cluster1::> system controller flash-cache show
```

Node	Slot	Model Number	Part Number	Serial Number	Firmware Version	Capacity (GB)	Device State
node1	6-1	X9172A	119-00209	A22P7061550000004	NA00	4096	ok
	6-2	X9170A	119-00207	A22P5061550000135	NA00	1024	ok
node2	6-1	X9172A	119-00209	A22P7061550000007	NA00	4096	ok
	6-2	X9170A	119-00207	A22P5061550000091	NA00	1024	ok

4 entries were displayed.

system controller flash-cache secure-erase commands

The secure-erase directory

system controller flash-cache secure-erase run

Perform a secure-erase operation on the targeted devices

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller flash-cache secure-erase run` command securely erases the given Flash Cache device.

Parameters**-node {<nodename>|local} - Node**

Selects the node of the specified Flash Cache devices.

-slot <text> - Slot

Selects the slot or slot-subslot of the specified Flash Cache devices.

Examples

The following example securely erases the selected Flash Cache device:

```
cluster1::> system controller flash-cache secure-erase -node node1 -slot 0-1
```

system controller flash-cache secure-erase show

Display the Flash Cache card status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller flash-cache secure-erase show` command displays the current Flash Cache device secure-erase status.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

If this parameter is specified, only status information for the matching node is displayed.

[-slot <text>] - Slot

If this parameter is specified, only status information for the matching slot is displayed. Slot can have a format of slot or slot-subslot.

[-device-state {ok|erasing|erased|failed|removed}] - Device State

If this parameter is specified, only status information for the matching device-state is displayed.

Examples

The following example displays the current state of all the Flash Cache devices:

```
cluster1::> system controller flash-cache secure-erase show
Node      Slot Device State
-----
node1
    6-1   ok
    6-2   erasing
node2
    6-1   erased
    6-2   ok
4 entries were displayed.
```

system controller fru commands

The fru directory

system controller fru show

Display Information About the FRUs in the Controller

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller fru show` command displays information about all the controller specific Field Replaceable Units (FRUs) in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about all the FRUs in the cluster:

- Node
- FRU name
- Health monitor subsystem

- Health monitor status

To display more details, use the -instance parameter.

Parameters

{ [-fields <fieldname>, ...]

Selects the fields that you specify.

| [-instance]}

Displays detailed information about the controller specific FRUs in the cluster.

[-node {<nodename>|local}] - Node

Selects information about the FRUs in the specified node.

[-subsystem <Subsystem>] - Subsystem

Selects information about the FRUs of the specified subsystem.

[-serial-number <text>] - FRU Serial Number

Selects information about the FRU with the specified serial number.

[-fru-name <text>] - Name of the FRU

Selects information about the FRU with the specified FRU name.

[-type {controller|psu|fan|dimm|bootmedia|ioxm|nvram|nvdimm}] - FRU Type

Selects information about the FRU with the specified FRU type.

[-name <text>] - FRU Name

Selects information about the FRU with the specified unique name.

[-state <text>] - FRU State

Selects information about the FRU with the specified state.

[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status

Selects information about the FRU with the specified health monitor status.

[-display-name <text>] - Display Name for the Fru

Selects information about the FRU with the specified display name.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Monitor Name

Selects information about the FRU with the specified health monitor type.

[-model <text>] - Model Type

Selects information about the FRU with the specified model.

[-chassis-id <text>] - Chassis ID

Selects information about the FRU with the specified chassis ID.

[-location <text>] - Location of the FRU

Selects information about the FRU with the specified FRU location.

[-additional-info <text>] - Additional Information About the FRU

Selects information about the FRU with the specified additional information.

Examples

The example below displays information about all controller specific FRUs in the cluster.

```
cluster1::> system controller fru show
```

Node	FRU Name	Subsystem	Status
node1	PSU1 FRU	Environment	ok
node1	PSU2 FRU	Environment	ok
node1	DIMM-NV1	Memory	ok
node1	DIMM-1	Memory	ok
node1	Micron Technology 0x655 (ad.0) Motherboard		ok

```

node2          PSU1 FRU          Environment      ok
node2          PSU2 FRU          Environment      ok
node2          DIMM-NV1          Memory          ok
node2          DIMM-1            Memory          ok
node2          Micron Technology 0x655 (ad.0) Motherboard  ok
10 entries were displayed.

```

The example below displays information about the specific FRU.

```

cluster1::> system controller fru show -instance -serial-number AD-01-1306-2EA01E9A
Node: node1
Subsystem: Memory
FRU Serial Number: AD-01-1306-2EA01E9A
Name of the FRU: DIMM-1
FRU Type: dimm
FRU Name: DIMM-1
FRU State: ok
Status: ok
Display Name for the Fru: DIMM-1
Monitor Name: controller
Model Type: none
Chassis ID: 4591227214
Location of the FRU: Memory Slot: 1
Additional Information About the FRU: Part No: HMT82GV7MMR4A-H9

```

system controller fru show-manufacturing-info

Display manufacturing information of FRUs

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller fru show-manufacturing-info` command displays manufacturing information for field replaceable units (FRUs) installed in the system. The information includes FRU-description, serial number, part number, and revision number. To display more details, use the `-instance` parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

Displays detailed information about the installed FRUs in the system.

[-node {<nodename>|local}] - Node

Selects a specific node's installed FRUs.

[-system-sn <text>] - System Serial Number

Selects information about installed FRUs with the specified system serial number.

[-model-name <text>] - Model Name

Selects information about installed FRUs with the specified model name.

[-system-id <text>] - System ID

Selects information about installed FRUs with the specified system ID.

[-kernel-version <text>] - Kernel Version

Selects information about installed FRUs with the specified kernel version.

[-firmware-release <text>] - Firmware Release

Selects information about installed FRUs with the specified firmware release.

[-description <text>] - FRU Description

Selects information about installed FRUs with the specified FRU description.

[-fru-subtype <text>] - FRU Sub-type

Selects information about the FRU with the specified FRU subtype.

[-serial-number <text>] - FRU Serial Number

Selects information about the FRU with the specified serial number.

[-part-number <text>] - FRU Part Number

Selects information about the FRU with the specified part number.

[-revision <text>] - FRU Revision of Part Number

Selects information about the FRU with the specified revision.

[-manufacturer <text>] - FRU Manufacturer

Selects information about the FRU with the specified manufacturer.

[-manufacture-date <text>] - FRU Manufacturing Date

Selects information about the FRU with the specified manufacture date.

[-product-id <text>] - FRU Product Identifier

Selects information about the FRU with the specified product ID.

[-firmware-version <text>] - FRU Firmware Version

Selects information about the FRU with the specified firmware version.

Examples

The following example displays all installed FRUs in the system:

```
cluster1::> system controller fru show-manufacturing-info

Node: platsw-lodi-1-01
System Serial Number: 791541000047
Model Name: FAS9040
System ID: 0537024373
Firmware release: 10.0X18
Kernel Version: NetApp Release sysMman_3887886_1608151712: Mon Aug 15
15:54:00 PDT 2016
```

system controller fru led commands

FRU LED Commands

system controller fru led disable-all

Turn off all the LEDs Data Ontap has lit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system controller fru led disable-all` command turns off all the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on. Only the controller and IOXM internal FRU fault LEDs can be controlled by the end-user. The summary fault LEDs are turned on and off based on the simple policy described above. If you want to turn off the summary fault LED, you must turn off all internal FRU fault LEDs.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis. In addition, internal FRU fault LEDs will remain on until explicitly turned off by the end-user, even after a FRU has been replaced.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the [“system controller fru led show” on page 1084](#) command matches that specified on the FRU map label.

Examples

Turn off all FRU fault LEDs.

```
cluster1::*> system controller fru led disable-all
14 entries were modified.
```

system controller fru led enable-all

Light all the LEDs

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system controller fru led enable-all` command turns on all the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on. Only the controller and IOXM internal FRU fault LEDs can be controlled by the end-user. The summary fault LEDs are turned on and off based on the simple policy described above. If you want to turn off the summary fault LED, you must turn off all internal FRU fault LEDs.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis. In addition, internal FRU fault LEDs will remain on until explicitly turned off by the end-user, even after a FRU has been replaced.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the ["system controller fru led show" on page 1084](#) command matches that specified on the FRU map label.

Examples

Turn on all FRU fault LEDs.

```
cluster1::*> system controller fru led enable-all  
14 entries were modified.
```

system controller fru led modify

Modify the status of FRU LEDs

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system controller fru led modify` command modifies the current state of the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on. Only the controller and IOXM internal FRU fault LEDs can be controlled by the end-user. The summary fault LEDs are turned on and off based on the simple policy described above. If you want to turn off the summary fault LED, you must turn off all internal FRU fault LEDs.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis. In addition, internal FRU fault LEDs will remain on until explicitly turned off by the end-user, even after a FRU has been replaced.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the [“system controller fru led show” on page 1084](#) command matches that specified on the FRU map label.

Parameters

-node {<nodename>|local} - Node

Selects FRU fault LEDs on the specified nodes.

-fru-id <FRU LED key> - FRU ID

Selects the FRU fault LEDs that match the specified FRU type.

-fru-slot <integer> - FRU Slot

Selects the FRU fault LEDs that match the specified slot.

[-fru-state {on|off|unknown}] - FRU State

Specifies the target state for the FRU fault LED.

Examples

Turn off DIMM 3's FRU fault LED.

```
cluster1::> system controller fru led modify -node node1 -fru-id dimm -fru-slot 3 -fru-state on
```

The example below turns on all PCI FRU fault LEDs.

```
cluster1::> system controller fru led modify -node node1 -fru-id pci -fru-slot * -fru-state on
```

system controller fru led show

Display the status of FRU LEDs

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system controller fru led show` command displays information about the current state of the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the `system controller fru led show` command matches that specified on the FRU map label.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects FRU fault LEDs on the specified nodes.

[-fru-id <FRU LED key>] - FRU ID

Selects the FRU fault LEDs that match the specified FRU type.

[-fru-slot <integer>] - FRU Slot

Selects the FRU fault LEDs that match the specified slot.

[-fru-bay <text>] - FRU Bay

Selects the FRU fault LEDs that match the specified bay.

[-fru-state {on|off|unknown}] - FRU State

Selects the FRU fault LEDs that match the specified status.

[-lit-by <text>] - Lit By

Selects the FRU fault LEDs that were lit by the specified source.

Examples

List the current state of all FRU fault LEDs.

```
cluster1::*> system controller fru led show
Node          FRU Type   Bay Slot State Lit By
-----
host1
controller    A 1      on   SP
ioxm          B 1      off  -
pci           - 1      off  -
pci           - 2      off  -
pci           - 3      off  -
pci           - 4      off  -
pci           - 5      off  -
pci           - 6      off  -
dimm-nv       - 1      off  -
dimm-nv       - 2      off  -
dimm          - 1      off  -
dimm          - 2      off  -
dimm          - 3      off  -
dimm          - 4      off  -
identify      - 1      off  -
```

5 entries were displayed.

The example below displays the status of only a specific FRU.

```
cluster1::*> system controller fru led show -node host1 -fru-id controller -fru-slot 1
Node          FRU Type   Bay Slot State Lit By
-----
host1
controller    A 1      off  -
```

system controller ioxm commands

The `ioxm` directory

system controller ioxm show

Displays IOXM Device Health Status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller ioxm show` command displays the details of the IO expansion modules (IOXMs) that are connected to the nodes in a cluster. These commands are available for 80xx, 25xx and later systems.

Earlier models are not supported. By default, the command displays the following information about the IOXMs:

- Node name
- Display name
- Is IOXM present?
- Power status
- Health monitor status

To display more details, use the `-instance` parameter.

Parameters

{ [-fields <fieldname>, ...]

Selects the fields that you specify.

| [-instance]}

Displays detailed information for all the IOXMs.

[-node {<nodename>|local}] - Node

Selects the IOXM that is connected to the specified node.

[-chassis-config {c-i|c-c|c-b}] - Controller-IOXM or Controller-Controller or Controller-Blank

Selects the IOXMs with the specified chassis configuration.

[-is-present {present|not-present}] - IOXM Presence

Selects the IOXMs that are connected and detected (`present`) or connected but not detected (`not-present`).

[-power {good|bad}] - Power to IOXM

Selects the IOXMs with the specified power state.

[-display-name <text>] - Display Name

Selects the IOXMs with the specified display name.

[-unique-name <text>] - Unique Name

Selects the IOXM with the specified unique name.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name

Selects the IOXMs with the specified health monitor.

[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - IOXM Health

Selects the IOXMs with the specified health monitor status.

Examples

The example below displays the information of all the IOXMs that are connected to the nodes in a cluster.

```
cluster1::> system controller ioxm show
```

Node	Display Name	Is-Present?	Power	Status
node1	IOXM	present	good	ok
node2	IOXM	present	good	ok

The example below displays detailed information of an IOXM that is connected to a node.

```
cluster1::> system controller ioxm show -instance -node node1
```

```
Node: node1
Controller-IOXM or Controller-Controller or Controller-Blank: c-i
IOXM Presence: present
Power to IOXM: good
Display Name: node1/IOXM
Unique Name: 8006459930
Health Monitor Name: controller
IOXM Health: ok
```

system controller location-led commands

The location-led directory

system controller location-led modify

Modify the location LED state of a controller

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller location-led modify` command modifies the current state of the location LED. When lit, the location LED can help you find the controller in the data center.

There is a blue location LED on every controller and on the front of the chassis. When you turn on the location LED for either controller, the chassis location LED automatically turns on. When both controller location LEDs are off, the chassis location LED automatically turns off.

After the location LED is turned on, it stays illuminated for 30 minutes and then automatically shuts off.

Parameters

-node {<nodename>|local} - Node

Selects the location LED on the specified filers.

[-state {on|off}] - LED State

Modifies the state of the location LED on the filer.

Examples

The following example turns on the location LED:

```
cluster1::*> system controller location-led modify -node node1 -state on
```

Turn off Location LED.

```
cluster1::*> system controller location-led modify -node node1 -state off
```

system controller location-led show

Display the location LED state on controllers

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller location-led show` command shows the current state of the location LED. When lit, the location LED can help you find the controller in the data center.

There is a blue location LED on every controller and on the front of the chassis. When you turn on the location LED for either controller, the chassis location LED automatically turns on. When both controller location LEDs are off, the chassis location LED automatically turns off.

After the location LED is turned on, it stays illuminated for 30 minutes and then automatically shuts off.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the location LED on the specified filers.

[-state {on|off}] - LED State

Displays the location LED's status.

Examples

The following example lists the current state of the location LED:

```
cluster1::*> system controller location-led show
Node      Location LED State
-----
node1     Off
node2     Off
```

system controller memory commands

The memory directory

system controller memory dimm commands

The dimm directory

system controller memory dimm show

Display the Memory DIMM Table

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller memory dimm show` command displays information about the DIMMs in all the nodes in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about all the DIMMs in the cluster:

- Node
- DIMM name
- Uncorrectable ECC error count
- Correctable ECC error count
- CPU socket
- Channel
- Slot number
- Health monitor status

To display more details, use the `-instance` parameter.

Parameters

{ **[-fields <fieldname>, ...]**

Selects the fields that you specify.

| **[-instance]**

Displays detailed information about the DIMMs in all the controllers in the cluster.

[-node {<nodename>|local}] - Node

Selects information about the DIMMs in the specified node.

[-pds-id <integer>] - DIMM ID

Selects information about the DIMMs with the specified DIMM ID.

[-slotname <text>] - Slot Name

Selects information about the DIMMs with the specified slot name.

[-socket <integer>] - CPU Socket

Selects information about the DIMMs with the specified socket ID.

[-channel <integer>] - Channel

Selects information about the DIMMs with the specified channel number.

[-slot-no <integer>] - Slot Number on a Channel

Selects information about the DIMMs with the specified slot number.

[-serial <text>] - Serial Number

Selects information about the DIMMs with the specified serial number.

[-part-no <text>] - Part Number

Selects information about the DIMMs with the specified part number.

[-cecc-count <integer>] - Correctable ECC Error Count

Selects information about the DIMMs with the specified correctable ECC error count.

[-uecc-count <integer>] - Uncorrectable ECC Error Count

Selects information about the DIMMs with the specified uncorrectable ECC error count.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name

Selects information about the DIMMs with the specified health monitor.

[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status

Selects information about the DIMMs with the specified health monitor status.

[-name <text>] - Unique Name of DIMM

Selects information about the DIMMs with the specified unique name.

[-display-name <text>] - Display Name for the DIMM

Selects information about the DIMMs with the specified display name.

Examples

The example below displays information about the DIMMs in all the nodes in the cluster.

```
cluster1::> system controller memory dimm show
Node      DIMM      UECC      CECC      CPU      Slot
Name      Count     Count    Socket   Channel  Number  Status
-----
node1     DIMM-1      0         0         0         0         0  ok
node1     DIMM-NV1    0         0         0         1         1  ok
node2     DIMM-1      1         0         0         0         0  ok
node3     DIMM-NV1    0         0         0         1         1  ok
4 entries were displayed.
```

The example below displays detailed information about a specific DIMM in a specific controller.

```
cluster1::> system controller memory dimm show -instance -node node1 -pds-id 1
Node: node1
DIMM ID: 1
Slot Name: DIMM-1
CPU Socket: 0
Channel: 0
Slot Number on a Channel: 0
Serial Number: AD-01-1306-2EA01E9A
Part Number: HMT82GV7MMR4A-H9
Correctable ECC Error Count: 0
Uncorrectable ECC Error Count: 0
Health Monitor Name: controller
Status: ok
Unique Name of DIMM: DIMM-1
Display Name for the DIMM: DIMM-1
```

system controller nvram-bb-threshold commands

The nvram-bb-threshold directory

system controller nvram-bb-threshold show

Display the controller NVRAM bad block threshold

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller nvram-bb-threshold show` command displays the threshold for the NVRAM bad block counts for a node.

system controller pci commands

The pci directory

system controller pci show

Display the PCI Device Table

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller pci show` command displays details of the PCI devices present in all of the nodes in a cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the PCI devices:

- Node name
- Display name
- Correctable error count
- Functional link width
- Functional link speed
- Health monitor status

To display more details, use the `-instance` parameter.

Parameters

[`-fields <fieldname>, ...`]

Selects the fields that you specify.

[`-instance`]

Displays detailed information for all of the PCI devices.

[`-node {<nodename>|local}`] - Node

Selects the PCI devices that are present in the specified node.

[`-bus-number <integer>`] - Bus Number

Selects the PCI devices with the specified bus number.

[`-device-number <integer>`] - Device Number

Selects the PCI devices with the specified device number.

[`-function-number <integer>`] - Function Number

Selects the PCI devices with the specified function number.

[`-slot-number <integer>`] - Slot Info

Selects the PCI devices with the specified slot number.

[`-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}`] - Health Monitor Name

Selects the PCI devices monitored by the specified health monitor.

[-vendor-id <Hex Integer>] - Vendor ID

Selects the PCI devices with the specified vendor ID.

[-device-id <Hex Integer>] - Device ID

Selects the PCI devices with the specified device ID.

[-physical-link-width <integer>] - Physical Link Width

Selects the PCI devices with the specified physical link width.

[-functional-link-width <integer>] - Functional Link Width

Selects the PCI devices with the specified functional link width.

[-physical-link-speed <text>] - Physical Link Speed(GT/s)

Selects the PCI devices with the specified physical link speed.

[-functional-link-speed <text>] - Functional Link Speed(GT/s)

Selects the PCI devices with the specified functional link speed.

[-unique-name <text>] - Unique Name

Selects the PCI devices with the specified unique name.

[-corr-err-count <integer>] - Correctable Error Count

Selects the PCI devices with the specified correctable error count.

[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status

Selects the PCI devices with the specified health monitor status.

[-display-name <text>] - Display Name

Selects the PCI devices with the specified display name.

[-cerr-diff <integer>] - Correctable Error Difference

Selects the PCI devices with the specified difference in correctable error count.

Examples

The example below displays the information about the PCIe devices present in all of the nodes in the cluster.

```
cluster1::> system controller pci show
```

Node	Display Name	Correctable Error Count	Functional Link Width	Functional Link Speed	Status
cluster1-01	Ontap PCI Device 0	0	4	5GT/s	ok
cluster1-02	Ontap PCI Device 4	0	4	5GT/s	ok

The example below displays detailed information about a PCIe device in a node.

```
cluster1::> system controller pcie show -instance -node cluster1-01 -bus-number 1
```

```
Node: cluster1-01
  Bus Number: 1
  Device Number: 0
  Function Number: 0
  Slot Info: 0
  Health Monitor Name: controller
    Vendor ID: 11f8
    Device ID: 8001
  Physical Link Width: 4
  Functional Link Width: 4
  Physical Link Speed(GT/s): 5GT/s
  Functional Link Speed(GT/s): 5GT/s
    Unique Name: ontap0@pci0:1:0:0
  Correctable Error Count: 0
    Status: ok
    Display Name: Ontap PCI Device 0
  Correctable Error Difference: 0
```

system controller pcicerr commands

The pcicerr directory

system controller pcicerr threshold commands

The threshold directory

system controller pcicerr threshold modify

Modify the Node PCIe error alert threshold

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system controller pcicerr threshold modify` command modifies node-wide PCIe correctable error threshold counts in the cluster.

Parameters

[-pcie-cerr-threshold <integer>] - Corr. Error Limit

The PCIe error threshold count that would trigger an alert if exceeded.

[-nvram-bb-threshold <integer>] - NVRAM Bad Block limit

The NVRAM bad block threshold count that would trigger an alert if exceeded.

Examples

The example below displays the information about setting node-wide PCIe error threshold count in the cluster:

```
cluster1::> system controller threshold modify -pcie-cerr-threshold 100
```

system controller pcicerr threshold show

Display the Node PCIe error alert threshold

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller pcicerr threshold show` command displays information about node-wide PCIe correctable error threshold counts in the cluster.

Examples

The example below displays the information about node-wide PCIe error threshold count in the cluster:

```
cluster1::> system controller pcicerr threshold show
```

```
PCIe Error Threshold
-----
                        200
```

system controller platform-capability commands

The platform-capability directory

system controller platform-capability show

Display platform capabilities

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller platform-capability show` command displays information about all platform capabilities for each controller in the cluster. By default, the command displays the following information about all controllers in the cluster:

- Controller Name
- Capability ID
- Capability Supported?
- Capability Name

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

Displays detailed information about all controllers in the cluster.

[-node {<nodename>|local}] - Node

Selects information about the specified controller.

[-capability-id <integer>] - Capability ID

Selects the desired capability ID.

[-supported <text>] - Supported?

Selects the desired capability support state (true or false).

[-name <text>] - Capability Name

Selects the desired capability name.

Examples

The following example displays platform capability information for the controller:

```
cluster1::> system controller platform-capability show
Node          Capability ID Supported? Capability Name
-----
or-099-diag-01
              0          false    CAP_CMCI_ENABLED
              1          false    CAP_HA_CONFIG_ONLY
              2           true    CAP_SUPPORT_CARD_FRU
              3           true    CAP_SCORPIO_EN
              4          false    CAP_NVD_EN
              5          false    CAP_ENABLE_HPET
              6          false    CAP_VERIFY_ACPI_TABLE
7 entries were displayed.
```

system controller service-event commands

The service-event directory

system controller service-event delete

Manually clear a selected service event

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller service-event delete` command removes the service event from the list and extinguishes all related FRU attention LEDs.

In some cases, where the underlying fault condition remains, the service event might be reported again, causing it to reappear in the list. In such cases, it is necessary to remedy the underlying fault condition in order to clear the service event.

Parameters

-node {<nodename>|local} - Node

Selects service events on the specified nodes.

-event-id <integer> - Service Event ID

Selects the service events that match the specified event identifier. Together with the node, this field uniquely identifies the row to delete. Use the [“system controller service-event show” on page 1094](#) command to find the event identifier for the service event to delete.

Examples

The following example lists the currently active service events. Then, using the listed Service Event ID, the service event is deleted:

```
cluster1::> system controller service-event show
```

Node	ID	Event Location	Event Description
plata4-1a	1	DIMM in slot 1 on Controller A	Uncorrectable ECC

```
cluster1::> system controller service-event delete -event-id 1
```

system controller service-event show

Display the active service events causing attention LEDs to be lit

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller service-event show` command displays one or more events that have been detected by the system for which a physical service action might be required. Physical service actions sometimes involve replacing or re-seating misbehaving FRUs. In such cases FRU attention LEDs will be illuminated to assist in physically locating the FRU in need of attention. When the FRU in question is contained within another FRU, both the inner and outer FRU attention LEDs will be lit. It creates a path of LEDs that starts at the chassis level and leads to the FRU in question. For example, if a DIMM is missing from the controller motherboard, the storage OS will detect this and log a service event whose location is the DIMM slot on the controller. The DIMM slot LED, controller LED and chassis LED will all be lit to create a path of LEDs to follow.

FRU Attention LEDs that are not visible from outside of the system (e.g. those on the controller motherboard such as DIMMs, boot device etc.) will remain on for a few minutes, even after power is removed from the containing FRU. As such, when the controller is removed from the chassis, a DIMM slot FRU attention LED will remain on, helping to locate the FRU in need of attention.

Generally, service events are cleared automatically when the issue is resolved. The corresponding FRU attention LEDs are extinguished accordingly. In cases where the service event request is caused by an environmental issue, it might be necessary to manually remove the service event from the list. This can be done using the [“system controller service-event delete” on page 1093](#) command.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects service events on the specified nodes.

[-event-id <integer>] - Service Event ID

Selects the service events that match the specified event identifier. Together with the node, this field uniquely identifies the row for use with the [“system controller service-event delete” on page 1093](#) command

[-event-loc <text>] - Location

Selects the service events that match the specified event location.

[-event-desc <text>] - Description

Selects the service events that match the specified event description.

[-event-timestamp <text>] - Timestamp

The time that the event occurred, recorded by the Service Processor

Examples

The following example lists the currently active service events.

```
cluster1::> system controller service-event show
```

Node	ID	Event Location	Event Description
plata4-1a	1	DIMM in slot 1 on Controller A	Uncorrectable ECC

system controller slot commands

Manage slot configuration and operation

system controller slot module commands

Manage module configuration and operation

system controller slot module insert

Add a module on the controller

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller slot module insert` command adds a module on the controller.

Parameters

-node {<nodename>|local} - Node

Selects the PCIe modules that are present in the specified node.

-slot <text> - Slot Number

Selects the PCIe modules present in the specified slot or slot-subslot combination.

Examples

The following example adds a module in the local node:

```
p2i030:: system controller slot module insert -node local -slot 1
```

```
Warning: IO_CARRIER_NIANTIC_NIC module in slot 1 of node p2i030 will be powered  
on and initialized.
```

```
Do you want to continue? [y|n]: y
```

```
The module has been successfully powered on, initialized and placed into service.
```

```
p2i030::
```

system controller slot module replace

Power off a module on the controller for replacement

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller slot module replace` command powers off a module on the controller for replacement.

Parameters

-node <nodename>|/local} - Node

Selects the PCIe modules that are present in the specified node.

-slot <text> - Slot Number

Selects the PCIe modules present in the specified slot or slot-subslot combination.

Examples

The following example powers off a module in the local node:

```
p2i030:: system controller slot module replace -node local -slot 1
```

```
Warning: IO_CARRIER_NIANTIC_NIC module in slot 1 of node p2i030 will be powered  
off for replacement.
```

```
Do you want to continue? [y|n]: y
```

```
The module has been successfully powered off. It can now be safely replaced. After the replacement module is inserted, use the "system contro
```

```
p2i030::
```

system controller slot module show

Display hotplug status of a module on the controller

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller slot module show` command displays hotplug status of a module on the controller. The command displays the following information about the PCIe modules:

- Node
- Slot
- Module
- Status

To display more details, use the `-instance` parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node <nodename>|/local}] - Node

Selects the PCIe modules that are present in the specified node.

[-slot <text>] - Slot Number

Selects the PCIe modules present in the specified slot or slot-subslot combination.

[-status <text>] - Module Status

Selects hotplug status for PCIe modules.

[-card <text>] - Module Name

Selects module name for PCIe modules.

Examples

The following example displays hotplug status of PCI modules found in the local node:

```
::> system controller slot module show -node local
Node          Slot    Module                               Status
-----
localhost     1      IO_CARRIER_NIANTIC_NIC             powered-on
localhost     2      IO_4X_10GBIT_INTL_NIC               powered-on
localhost     3      IO_4X_12Gb_PMC_SAS                  powered-on
localhost     4      IO_4X_10GBE_16GFC_QLGC_CNA         powered-on
localhost     5      IO_4X_12Gb_PMC_SAS                  powered-on
localhost     6      NVRAM10                             hotplug-not-supported
localhost     6-1    empty                               empty
localhost     6-2    empty                               empty
localhost     7      IO_4X_12Gb_PMC_SAS                  powered-on
localhost     8      IO_4X_10GBIT_INTL_NIC               powered-on
localhost     9      IO_4X_12Gb_PMC_SAS                  powered-on
localhost    10      IO_4X_12Gb_PMC_SAS                  powered-on
localhost    11      IO_4X_12Gb_PMC_SAS                  powered-on
13 entries were displayed.

system controller sp commands

The sp directory

system controller sp config commands

The config directory

system controller sp config show

Display the Service Processor Config Table

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller sp config show` command displays the following configuration information of the service processor for all nodes in the cluster:

- Node name
- Service processor status
- Service processor firmware version
- Booted firmware version
- Service processor configuration status
- Physical Ethernet link status of service processor
- Health monitor status

To display more details, use the `-instance` parameter. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported.

Parameters

{ [-fields <fieldname>, ...]

Selects the field that you specify.

[-instance]

Displays detailed configuration information of the service processor.

[-node {<nodename>|local}] - Node

Use this parameter to list the service processor configuration of the specific node.

[-version <text>] - Firmware Version

Selects the service processor configuration with the specified firmware version.

[-boot-version {primary|backup}] - Booted Version

Selects the service processor configuration with the specified version of the currently booted partition.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name

Selects the service processor configuration with the specified monitor name.

[-sp-status {online|offline|sp-daemon-offline|node-offline|degraded|rebooting|unknown|updating}] - SP Status

Selects the service processor configuration with the specified status of service processor.

[-sp-config {true|false}] - Auto Update Configured

Selects information about the service processor with the specified configuration status of the service processor.

[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status

Selects the service processor configuration information with the specified service processor status.

[-link-status {up|down|disabled|unknown}] - Public Link Status

Selects the service processor configuration with the specified physical ethernet link status.

[-name <text>] - Display Name

Selects the service processor configuration with the specified unique name.

Examples

The example below displays configuration of the service processor in all the nodes in the cluster:

```
cluster1::> system controller sp config show
      Firmware  Booted   Auto Update  SP      Link
Node  Version   Version   Configured  Status  Status  Status
-----
node1  2.2.2       primary   true        online  up       ok
node2  2.2.2       primary   true        online  up       ok
```

The example below displays configuration of the service processor of a particular node in detail:

```
cluster1::> system controller sp config show -instance -node node1
      Node: node1
      Firmware Version: 2.2.2
      Booted Version: primary
      Health Monitor Name: controller
      SP Status: online
      Auto Update Configured: true
      Status: ok
      Public Link Status: up
      Display Name: SP Config
```

system controller sp upgrade commands

The upgrade directory

system controller sp upgrade show

Display the Service Processor Upgrade Table

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system controller sp upgrade show` command displays the following information about the service processor firmware of all the nodes in the cluster:

- Node name
- Is new firmware available?
- Is autoupdate enabled?
- Status of autoupdate
- Health monitor status

To display more details, use the `-instance` parameter. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported.

Parameters

{ [-fields <fieldname>, ...]

Selects the fields that you specify.

| [-instance]]

Displays detailed upgrade information of the service processor.

[-node {<nodename>|local}] - Node

Use this parameter to list the upgrade information of the service processor on the specified node.

[-new-fw-avail {true|false}] - New Firmware Available

Selects the information of the service processors which have new firmware available.

[-new-fw-version <text>] - New Firmware Version

Selects the information about service processors with the specified firmware version.

[-auto-update {true|false}] - Auto Update

Selects the information about service processors with the specified state.

[-auto-update-stat {installed|corrupt|updating|auto-updating|none}] - Auto Update Status

Selects the information about service processors with the specified auto update status.

[-auto-update-sttime <MM/DD/YYYY HH:MM:SS>] - Auto Update Start Time

Selects the information about service processors with the specified start time.

[-auto-update-entime <MM/DD/YYYY HH:MM:SS>] - Auto Update End Time

Selects the information about service processors with the specified end time.

[-auto-update-per <integer>] - Auto Update Percent Done

Selects the information about service processors with the specified auto update percentage completed.

[-auto-update-maxret <integer>] - Auto Update Maximum Retries

Selects the information about service processors with the specified maximum number of retries.

[-auto-update-curret <integer>] - Auto Update Current Retries

Selects the information about service processors with the specified number of current retries.

[-auto-update-prevstat {failed|passed}] - Previous AutoUpdate Status

Selects the information about service processors with the specified automatic update status.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name

Selects the information about service processors with the specified monitor name.

[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status

Selects the information about service processors with the specified health monitor status.

[-name <text>] - Display Name

Selects the information about service processors with the specified display name.

Examples

The example below displays service processor upgrade information for all nodes in the cluster:

```
cluster1::> system controller sp upgrade show
New   Firmware      Auto Update  Auto Update
Node  Available        Feature     Status      Status
-----
node1 false           true        installed   ok
node2 false           true        installed   ok
2 entries were displayed.
```

The example below displays the detailed service processor upgrade information for a specific node:

```
cluster1::> system controller sp upgrade show -instance -node node1
Node: node1
New Firmware Available: false
New Firmware Version: Not Applicable
Auto Update: true
Auto Update Status: installed
Auto Update Start Time: Thu Oct 20 20:06:03 2012 Etc/UTC
Auto Update End Time: Thu Oct 20 20:09:19 2012 Etc/UTC
Auto Update Percent Done: 0
Auto Update Maximum Retries: 5
Auto Update Current Retries: 0
Previous AutoUpdate Status: passed
Health Monitor Name: controller
Status: ok
Display Name: SP Upgrade
```

system configuration commands

Manage configuration backup and recovery

system configuration backup commands

Configuration Backup

system configuration backup copy

Copy a configuration backup

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system configuration backup copy` command copies a configuration backup from one node in the cluster to another node in the cluster.

Use the [“system configuration backup show” on page 1103](#) command to display configuration backups to copy.

Parameters

-from-node {<nodename>|local} - Source Node

Use this parameter to specify the name of the source node where the configuration backup currently exists.

-backup <text> - Backup Name

Use this parameter to specify the name of the configuration backup file to copy.

-to-node {<nodename>|local} - Destination Node

Use this parameter to specify the name of the destination node where the configuration backup copy is created.

Examples

The following example copies the configuration backup file `node1.special.7z` from the node `node1` to the node `node2`.

```
cluster1:*> system configuration backup copy -from-node node1 -backup node1.special.7z -to-node node2
[Job 295] Job is queued: Copy backup job.
```

system configuration backup create

Create a configuration backup

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system configuration backup create` command creates a new configuration backup file.

Parameters**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which to create the backup file.

[-backup-name <text>] - Backup Name

Use this parameter to specify the name of the backup file to create. The backup name cannot contain a space or any of the following characters: `* ? /`

[-backup-type {node|cluster}] - Backup Type

Use this parameter to specify the type of backup file to create.

Examples

The following example creates a new cluster configuration backup file called `node1.special.7z` on the node `node1`.

```
cluster1:*> system configuration backup create -node node1 -backup-name node1.special.7z -backup-type cluster
[Job 194] Job is queued: Cluster Backup OnDemand Job.
```

system configuration backup delete

Delete a configuration backup

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system configuration backup delete` command deletes a saved configuration backup.

Use the [“system configuration backup show” on page 1103](#) command to display saved configuration backups.

Parameters**-node {<nodename>|local} - Node**

Use this parameter to specify the name of the source node where the configuration backup currently exists.

-backup <text> - Backup Name

Use this parameter to specify the name of the configuration backup file to delete.

Examples

The following example shows how to delete the configuration backup file `node1.special.7z` from the node `node1`.

```
cluster1::*> system configuration backup delete -node node1 -backup node1.special.7z
```

system configuration backup download

Download a configuration backup

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system configuration backup download` command copies a configuration backup from a source URL to a node in the cluster.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the name of the node to which the configuration backup is downloaded.

-source <text> - Source URL

Use this parameter to specify the source URL of the configuration backup to download.

[-backup-name <text>] - Backup Name

Use this parameter to specify a new local file name for the downloaded configuration backup.

Examples

The following example shows how to download a configuration backup file from a URL to a file named `exampleconfig.download.7z` on the node `node2`.

```
cluster1::*> system configuration backup download -node node2 -source http://www.example.com/config/download/nodeconfig.7z -backup-name exam
```

system configuration backup rename

Rename a configuration backup

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system configuration backup rename` command changes the file name of a configuration backup file.

Use the [“system configuration backup show” on page 1103](#) command to display configuration backups to rename.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the name of the source node where the configuration backup currently exists.

-backup <text> - Backup Name

Use this parameter to specify the name of the configuration backup file to rename.

-new-name <text> - New Name

Use this parameter to specify a new name for the configuration backup file.

Examples

The following example renames the saved configuration file `download.config.7z` on the node `node1` to `test.config.7z`.

```
cluster1::*> system configuration backup rename -node node1 -backup download.config.7z -new-name test.config.7z
```

system configuration backup show

Show configuration backup information

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system configuration backup show` command displays information about saved configuration backups.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects configuration backups that are saved on the node you specify.

[-backup <text>] - Backup Name

Selects configuration backups that have the backup name you specify.

[-backup-type {node|cluster}] - Backup Type

Selects configuration backups of the type you specify.

[-time <MM/DD HH:MM:SS>] - Backup Creation Time

Selects configuration backups that were saved on the date and time you specify.

[-cluster-name <text>] - Cluster Name

Selects configuration backups that were saved in the cluster that has the name you specify.

[-cluster-uuid <UUID>] - Cluster UUID

Selects configuration backups that were saved in the cluster that has the UUID you specify.

[-size {<integer>[KB|MB|GB|TB|PB]] - Size of Backup

Selects configuration backups that have the file size you specify.

[-nodes-in-backup {<nodename>|local}, ...] - Nodes In Backup

Selects configuration backups that include the configuration of the nodes you specify.

[-version <text>] - Software Version

Selects configuration backups that have the software version you specify.

[-is-auto {true|false}] - Backup Created from Schedule (true or false)

A value of `true` selects configuration backups that were created from a schedule. A value of `false` selects configuration backups that were created manually.

[-schedule <text>] - Name of Backup Schedule

Selects configuration backups that were created by the schedule you specify.

Examples

The following example shows typical output for this command.

```
cluster1::* system configuration backup show
Node      Backup Tarball                                Time                Size
-----
node1     cluster1.8hour.2011-02-22.18_15_00.7z        02/22 18:15:00      7.78MB
node1     cluster1.8hour.2011-02-23.02_15_00.7z        02/23 02:15:00      7.98MB
node1     cluster1.8hour.2011-02-23.10_15_00.7z        02/23 10:15:00      7.72MB
node1     cluster1.daily.2011-02-22.00_10_00.7z        02/22 00:10:00      7.19MB
node1     cluster1.daily.2011-02-23.00_10_00.7z        02/23 00:10:00      7.99MB
Press [space] to page down, [return] for next line, or 'q' to quit... q
```

5 entries were displayed.

system configuration backup upload

Upload a configuration backup

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system configuration backup upload` command copies a configuration backup from a node in the cluster to a remote URL.

Parameters

-node <nodename>|local} - Node

Use this parameter to specify the name of the node from which the configuration backup is uploaded.

-backup <text> - Backup Name

Use this parameter to specify the file name of the configuration backup to upload.

-destination <text> - Destination URL

Use this parameter to specify the destination URL of the configuration backup.

Examples

The following example show how to upload the configuration backup file `testconfig.7z` from the node `node2` to a remote URL.

```
cluster1::*> system configuration backup upload -node node2 -backup testconfig.7z -destination ftp://www.example.com/config/uploads/testconfig.7z
```

system configuration backup settings commands

The settings directory

system configuration backup settings modify

Modify configuration backup settings

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system configuration backup settings modify` command changes settings for configuration backup.

Parameters

[-destination <text>] - Backup Destination URL

Use this parameter to specify the destination URL for uploads of configuration backups. Use the value "" to remove the destination URL.

[-username <text>] - Username for Destination

Use this parameter to specify the user name to use to log in to the destination system and perform the upload. Use the [“system configuration backup settings set-password” on page 1105](#) command to change the password used with this user name.

[-numbackups1 <integer>] - Number of Backups to Keep for Schedule 1

Use this parameter to specify the number of backups created by backup schedule 1 to keep on the destination system. If the number of backups exceeds this number, the oldest backup is removed.

[-numbackups2 <integer>] - Number of Backups to Keep for Schedule 2

Use this parameter to specify the number of backups created by backup schedule 2 to keep on the destination system. If the number of backups exceeds this number, the oldest backup is removed.

[-numbackups3 <integer>] - Number of Backups to Keep for Schedule 3

Use this parameter to specify the number of backups created by backup schedule 3 to keep on the destination system. If the number of backups exceeds this number, the oldest backup is removed.

Examples

The following example shows how to set the destination URL and user name used for uploads of configuration backups.

```
cluster1:*> system configuration backup settings modify -destination ftp://www.example.com/config/uploads/ -username admin
```

system configuration backup settings set-password

Modify password for destination URL

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system configuration backup settings set-password` command sets the password used for uploads of configuration backups. This password is used along with the username you specify using the [“system configuration backup settings modify” on page 1104](#) command to log in to the system and perform the upload. Enter the command without parameters. The command prompts you for a password, and for a confirmation of that password. Enter the same password at both prompts. The password is not displayed.

Use the [“system configuration backup settings show” on page 1105](#) command to display the destination URL for configuration backups. Use the [“system configuration backup settings modify” on page 1104](#) command to change the destination URL and remote username for configuration backups.

Examples

The following example shows successful execution of this command.

```
cluster1:*> system configuration backup settings set-password
```

```
Enter the password:
Confirm the password:
```

system configuration backup settings show

Show configuration backup settings

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system configuration backup settings show` command displays current settings for configuration backup. These settings apply to backups created automatically by schedules. By default, the command displays the URL to which configuration backups are uploaded, and the user name on the remote system used to perform the upload.

Use the [“system configuration backup settings set-password” on page 1105](#) command to change the password used with the user name on the destination. Use the [“system configuration backup settings modify” on page 1104](#) command to change the destination URL and username for uploads of configuration backups, and to change the number of backups to keep for each schedule.

Parameters

[-instance]

Use this parameter to display detailed information about configuration backup settings, including the number of backups to keep for each backup schedule.

Examples

The following example displays basic backup settings information.

```
cluster1:*> system configuration backup settings show
```

Backup Destination URL	Username
-----	-----
ftp://www.example.com/config/uploads/	jdoe

The following example shows detailed output using the *-instance* parameter.

```
cluster1::*> system configuration backup settings show -instance
Backup Destination URL: ftp://www.example.com/config/uploads/
Username for Destination: admin
Schedule 1: 8hour
Number of Backups to Keep for Schedule 1: 2
Schedule 2: daily
Number of Backups to Keep for Schedule 2: 2
Schedule 3: weekly
Number of Backups to Keep for Schedule 3: 2
```

system configuration recovery commands

Configuration Recovery

system configuration recovery cluster commands

The cluster directory

system configuration recovery cluster modify

Modify cluster recovery status

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system configuration recovery cluster modify` command modifies the cluster recovery status. This command should be used to end the cluster recovery after all recovery procedures are applied.

Parameters

[-recovery-status {complete|in-progress|not-in-recovery}] - Cluster Recovery Status

Use this parameter with the value `complete` to set the cluster recovery status after the cluster has been recreated and all of the nodes have been rejoined to it. This enables each node to resume normal system operations. The `in-progress` and `not-in-recovery` values are not applicable to this command.

Examples

The following example modifies the cluster recovery status.

```
source::> system configuration recovery cluster modify -recovery-status complete
```

system configuration recovery cluster recreate

Recreate cluster

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system configuration recovery cluster recreate` command re-creates a cluster, using either the current node or a configuration backup as a configuration template. After you re-create the cluster, rejoin nodes to the cluster using the [“system configuration recovery cluster rejoin” on page 1107](#) command.

Parameters

-from {node|backup} - From Node or Backup

Use this parameter with the value `node` to re-create the cluster using the current node as a configuration template. Use this parameter with the value `backup` to re-create the cluster using a configuration backup as a configuration template.

[-backup <text>] - Backup Name

Use this parameter to specify the name of a configuration backup file to use as a configuration template. If you specified the `-from` parameter with the value `backup`, you must use this parameter and specify a backup name. Use the [“system configuration backup show” on page 1103](#) command to view available configuration backup files.

Examples

The following example shows how to re-create a cluster using the node `node1` as a configuration template.

```
cluster1:*> system configuration recovery cluster recreate -from node
```

The following example shows how to re-create a cluster using the configuration backup `siteconfig.backup.7z` as a configuration template.

```
cluster1:*> system configuration recovery cluster recreate -from backup -backup siteconfig.backup.7z
```

system configuration recovery cluster rejoin

Rejoin a cluster

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system configuration recovery cluster rejoin` command rejoins a node to a new cluster created earlier using the [“system configuration recovery cluster recreate” on page 1106](#) command. Only use this command to recover a node from a disaster. Because this synchronization can overwrite critical cluster information, and will restart the node you specify, you are required to confirm this command before it executes.

Parameters

-node {<nodename>|local} - Node to Rejoin

Use this parameter to specify the node to rejoin to the cluster.

Examples

This example shows how to rejoin the node `node2` to the cluster.

```
cluster1:*> system configuration recovery cluster rejoin -node node2
```

```
Warning: This command will rejoin node "node2" into the local cluster,
         potentially overwriting critical cluster configuration files. This
         command should only be used to recover from a disaster. Do not perform
         any other recovery operations while this operation is in progress.
         This command will cause node "node2" to reboot.
```

```
Do you want to continue? [y/n]: y
```

system configuration recovery cluster show

Show cluster recovery status

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system configuration recovery cluster show` command displays the cluster recovery status. Cluster recovery status is "not-in-recovery" under normal operations, and it becomes "in-progress" if a new cluster is created using the [“system configuration recovery cluster recreate” on page 1106](#) command with the `-from backup` parameter. When cluster recovery status is "in-progress", wait until the output of the "Is Recovery Status Persisted" field is true before using the [“system configuration recovery cluster rejoin” on page 1107](#) command to recover other nodes in the cluster.

Examples

The following example displays the cluster recovery status.

```
source::> system configuration recovery cluster show
Recovery Status: in-progress
Is Recovery Status Persisted: true
```

system configuration recovery cluster sync

Sync a node with cluster configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system configuration recovery cluster sync` command synchronizes a node with the cluster configuration. Only use this command to recover a node from a disaster. Because this synchronization can overwrite critical cluster information, and will restart the node you specify, you are required to confirm this command before it executes.

Parameters

-node {<nodename>|local} - Node to Synchronize

Use this parameter to specify the name of the node to synchronize with the cluster.

Examples

The following example shows the synchronization of the node `node2` to the cluster configuration.

```
cluster1::* system configuration recovery cluster sync -node node2
```

```
Warning: This command will synchronize node "node2" with the cluster
configuration, potentially overwriting critical cluster configuration
files on the node. This feature should only be used to recover from a
disaster. Do not perform any other recovery operations while this
operation is in progress. This command will cause all the cluster
applications on node "node2" to restart, interrupting administrative
CLI and Web interface on that node.
```

```
Do you want to continue? [y/n]: y
```

```
All cluster applications on node "node2" will be restarted. Verify that the cluster applications go online.
```

system configuration recovery node commands

The node directory

system configuration recovery node restore

Restore node configuration from a backup

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system configuration recovery node restore` command restores the configuration of the local node from a configuration backup file.

Use the [“system configuration backup show” on page 1103](#) command to view available configuration backup files.

Parameters

-backup <text> - Backup Name

Use this parameter to specify the name of a configuration backup file to use as the configuration template.

[-nodename-in-backup <text>] - Use Backup Identified by this Nodename

Use this parameter to specify a node within the configuration backup file to use as a configuration template. Only specify this parameter if you are specifying a name other than the name of the local node.

`[-force [true]] - Force Restore Operation`

Use this parameter with the value `true` to force the restore operation and overwrite the current configuration of the local node. This overrides all compatibility checks between the node and the configuration backup. The configuration in the backup is installed even if it is not compatible with the node's software and hardware.

Use this parameter with the value `false` to be warned of the specific dangers of restoring and be prompted for confirmation before executing the command. This value also assures that the command performs compatibility checks between configuration stored in the backup and the software and hardware of the node. The default is `false`.

Examples

The following example shows how to restore the configuration of the local node from the configuration backup of `node3` that is stored in the configuration backup file `example.backup.7z`.

```
cluster1::* system configuration recovery node restore -backup example.backup.7z
Warning: This command overwrites local configuration files with files contained
         in the specified backup file. Use this command only to recover from a
         disaster that resulted in the loss of the local configuration files.
         The node will reboot after restoring the local configuration.
Do you want to continue? [y]n: y
```

system feature-usage commands

Display feature information

system feature-usage show-history

Display Feature Usage History

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Display feature usage information in the cluster on a per-node and per-week basis.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance ]]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node`

Displays feature usage information for the specified node name.

`[-serial-number <Node Serial Number>] - Node Serial Number`

Displays feature usage information for the specified serial number.

`[-feature-name <Managed Feature>] - Feature Name`

Displays feature usage information for the specified feature name.

`[-week-number <Sequence Number>] - Week Number`

Displays feature usage information for the specified week number.

`[-usage-status {not-used|configured|in-use|not-available}] - Usage Status`

Displays feature usage information that matches the specified usage status.

[-date-collected <MM/DD/YYYY HH:MM:SS>] - Collection Date

Displays feature usage information that is collected on the day matching the specified date.

[-owner <text>] - Owner

Displays feature usage information for the specified owner name.

[-feature-message <text>] - Feature Message

Displays feature usage information that contains the specified feature message.

Examples

The following example displays a usage output filtered by the serial number and feature name:

```
cluster1::> system feature-usage show-history -serial-number 1-81-000000000000001122334455 -feature-name NFS
Node Serial Number: 1-81-000000000000001122334455
Feature Name: NFS
Owner: node1
Week # Usage Status      Date Collected      Feature Message
-----
    4 in-use             01/22/13  10:00:00
    3 in-use             01/15/13  10:00:00
    2 not-used           01/08/13  10:00:00
    1 configured         01/01/13  10:00:00
```

4 entries were displayed.

system feature-usage show-summary

Display Feature Usage Summary

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Display usage summary information about features in the cluster on a per-node basis. The summary information includes counter information such as the number of weeks the feature was in use and the last date and time the feature was used. Additional information can also be displayed by using the *-instance* parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the *-fields <fieldname>, ...* parameter, the command output also includes the specified field or fields. You can use *'-fields ?'* to display the fields to specify.

| [-instance]}

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[-serial-number <Node Serial Number>] - Node Serial Number

Displays usage summary information for the specified serial number.

[-feature-name <Managed Feature>] - Feature Name

Displays usage summary information for the specified feature name.

[-weeks-in-use <integer>] - Weeks In-Use

Displays usage summary information for features matching the number of weeks in use.

[-last-used <MM/DD/YYYY HH:MM:SS>] - Date last used

Displays usage summary information for features last used on the specified date.

[-owner <text>] - Owner

Displays usage summary information for the specified owner name.

[-weeks-not-used <integer>] - Weeks Not Used

Displays usage summary information for features matching the number of weeks not in use.

[-weeks-configured <integer>] - Weeks Configured

Displays usage summary information for features matching the number of weeks that the feature was in configuration.

[-weeks-not-available <integer>] - Weeks Data Not Available

Displays usage summary information for features matching the number of weeks when usage data was not available.

Examples

The following example displays a usage summary output for a cluster of two nodes:

```
cluster1::> system feature-usage show-summary
Node Serial Number: 1-81-0000000000000001122334455
Owner: node1
Feature Name  Weeks In Use      Date Last Used
-----
CIFS          10 1/1/2013 23:27:49
NFS           15 1/8/2013 23:48:03

Node Serial Number: 1-81-0000000000000001122334466
Owner: node2
Feature Name  Weeks In Use      Date Last Used
-----
CIFS          10 1/1/2013 23:26:38
NFS           20 1/8/2013 23:46:48
4 entries were displayed.
```

system fru-check commands

The fru-check directory

system fru-check show

Display Information About the FRUs in the Controller

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system fru-check show` command checks and displays the results of quick diagnostic tests done for certain FRUs of each controller in the cluster. The tests are not intended to be exhaustive, but simply to do a quick check of certain FRUs especially after replacement.

Parameters

{ [-fields <fieldname>, ...]

Selects the fields that have the specified name.

| [-instance]}

Selects detailed information (if available) for all the FRUs.

[-node {<nodename>|local}] - Node

Selects the FRUs that belong to the node that has the specified name.

[-serial-number <text>] - FRU Serial Number

Selects the FRU matching the specified serial number.

[-fru-name <text>] - FRU Name

Selects the FRU matching the specified fru-name.

[-fru-type {controller|dimm|bootmedia|nvram|nvdimm}] - FRU Type

Selects the FRUs of the specified type.

[-fru-status {pass|fail|unknown}] - Status

Selects the FRUs whose FRU check status matches that specified. "pass" indicates the FRU is operational. "fail" indicates the FRU is not operating correctly. "unknown" indicates a failure to obtain FRU information during the check.

[-display-name <text>] - Display Name

Selects the FRU matching the specified display name.

[-location <text>] - Location

Selects the FRUs whose location matches that specified. Example: Memory Slot: 1

[-additional-info <text>] - Additional Info

Selects the FRUs whose additional information matches that specified. Example: Part No: 69003140-I00-NTA-T

[-reason <text>] - Details

Selects the FRUs whose failure reason matches that specified.

system ha commands

The ha directory

High-Availability interconnect device nic reset

Manage high-availability interconnect

The [“system ha interconnect status” on page 1122](#) directory displays the interconnect device nic reset configuration information.

High-Availability interconnect basic configuration information

The config directory

The `system ha interconnect config` directory displays the interconnect device basic configuration information.

system ha interconnect config show

Display the high-availability interconnect configuration information

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system ha interconnect config show` command displays the high-availability interconnect device basic configuration information.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

| **[-instance]**

Use this parameter to display all the fields from all nodes in cluster.

[-node {<nodename>|local}] - Node

Use this parameter to display all the fields from the specified node in the cluster.

[-transport <text>] - Interconnect Type

Selects the nodes that match this HA interconnect transport type.

[-local-sysid <integer>] - Local System ID

Selects the nodes that match this local system unique identifier.

[-partner-sysid <integer>] - Partner System ID

Selects the nodes that match this partner system unique identifier.

[-initiator {local|partner}] - Connection Initiator

Selects the nodes that match this parameter value. The value is the initiator of the connection request.

[-port-name <text>, ...] - Port

Selects the nodes that match this port name.

[-ipaddress <text>, ...] - IP Address

Selects the nodes that match this IP address.

[-interface {backplane|external}] - Interface

Selects the nodes that match this parameter value. *external* means the HA interconnect links between partner nodes are connected externally. *backplane* means the HA interconnect links between partner nodes are connected over the backplane.

Examples

The following example displays the HA interconnect configuration information on FAS8000 series nodes in the cluster:

```
cluster1::*> system ha interconnect config show
```

```
Node: ic-f8040-01
Interconnect Type: Infiniband (Mellanox ConnectX)
Local System ID: 536875713
Partner System ID: 536875678
Connection Initiator: local
Interface: backplane
```

Port	IP Address	Flags
ib0a	192.0.3.236	0x0
ib0b	192.0.3.237	0x0

```
Node: ic-f8040-02
Interconnect Type: Infiniband (Mellanox ConnectX)
Local System ID: 536875678
Partner System ID: 536875713
Connection Initiator: partner
Interface: backplane
```

Port	IP Address	Flags
ib0a	192.0.3.96	0x0
ib0b	192.0.3.97	0x0

2 entries were displayed.

The following example displays the HA interconnect configuration information on FAS2500 series nodes in the cluster:

```
cluster1::*> system ha interconnect config show
```

```
Node: ic-f2554-03
Interconnect Type: Infiniband (Mellanox Sinai)
Local System ID: 1781036608
Partner System ID: 1780360209
Connection Initiator: local
Interface: backplane
```

Port	IP Address	Flags

```

-----
ib0a  ib0a  -

Node: ic-f2554-04
Interconnect Type: Infiniband (Mellanox Sinai)
Local System ID: 1780360209

```

High-Availability interconnect device link operation

The link directory

The `system ha interconnect link` directory toggles the interconnect links.

system ha interconnect link off

Turn off the interconnect link

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system ha interconnect link off` command turns off the specified link on the high-availability interconnect device. For the nodes in the cluster with two external high-availability interconnect links, you must specify the link number (0-based) to turn off the specified link. For the nodes in the cluster with interconnect links over the backplane, you must specify the link number 1 to turn off the link.

Parameters

-node <nodename> - Node

This mandatory parameter specifies the node on which the interconnect link is to be turned off. The value "local" specifies the current node.

-link {0|1} - Link

This mandatory parameter specifies the interconnect link number (0-based) to turn off.

Examples

The following example displays output of the command on the nodes with a single interconnect link or nodes with interconnect links over the backplane:

```

cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 0
Error: command failed: Invalid link value 0. Specify 1.
cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 1

```

The following example displays output of the command on the nodes with two interconnect links connected externally:

```

cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 0
cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 1

```

system ha interconnect link on

Turn on the interconnect link

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system ha interconnect link on` command turns on the specified link on the high-availability interconnect device. For the nodes in the cluster with two external high-availability interconnect links, you must specify the link number (0-based) to turn on the specified link. For the nodes in the cluster with interconnect links over the backplane, you must specify the link number 1 to turn on the link.

Parameters

-node <nodename> - Node

This mandatory parameter specifies the node on which the interconnect link is to be turned on. The value "local" specifies the current node.

-link {0|1} - Link

This mandatory parameter specifies the interconnect link number (0-based) to turn on.

Examples

The following example displays output of the command on the nodes with a single interconnect link or nodes with interconnect links over the backplane:

```
cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 0
Error: command failed: Invalid link value 0. Specify 1.
cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 1
```

The following example displays output of the command on the nodes with two interconnect links connected externally:

```
cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 0
cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 1
```

High-Availability interconnect device port information

The port directory

The `system ha interconnect port` directory displays the interconnect device port information.

system ha interconnect port show

Display the high-availability interconnect device port information

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system ha interconnect port show` command displays the high-availability interconnect device port physical layer and link layer status information.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>,... parameter, the command displays only the fields that you specify.

[-instance]}

Use this parameter to display all the fields from all nodes in the cluster.

[-node {<nodename>|local}] - Node

Use this parameter to display all the fields from the specified node in the cluster.

[-link-monitor {on|off}] - Link Monitor Detection

Selects the nodes that match this parameter value.

[-port <integer>, ...] - Port Number

Selects the nodes that match this parameter value.

[-phy-layer-state {invalid|sleep|polling|disabled|port-configuration-testing|linkup|link-error-recovery|phytest|reserved}, ...] - Physical Layer State

Selects the nodes that match this parameter value.

[-link-layer-state {invalid|down|initialize|armed|active|reserved}, ...] - Link Layer State

Selects the nodes that match this parameter value.

[-phy-link-up-count <integer>, ...] - Physical Link Up Count

Selects the nodes that match this parameter value. The value is total number of times the link on a given port is transitioned up.

[-phy-link-down-count <integer>, ...] - Physical Link Down Count

Selects the nodes that match this parameter value. The value is total number of times the link on a given port is transitioned down.

[-is-active-link {true|false}, ...] - Is the Link Active

Selects the nodes that match this parameter value. The value *true* means the interconnect data channels are established on this link.

Examples

The following example displays the HA interconnect device port information on FAS8000 series nodes in the cluster:

```
cluster1::*> system ha interconnect port show
```

Node	Link Monitor	Port	Physical Layer State	Link Layer State	Physical Link Up	Physical Link Down	Active Link
ic-f8040-01	on		0 linkup	active	1	0	true
			1 linkup	active	1	0	false
ic-f8040-02	on		0 linkup	active	1	0	true
			1 linkup	active	1	0	false

2 entries were displayed.

High-Availability interconnect device scatter-gather list statistics

The statistics directory

The “[system ha interconnect statistics show-scatter-gather-list](#)” on page 1116 directory displays the interconnect device scatter-gather list statistics.

system ha interconnect statistics show-scatter-gather-list

Display the high-availability interconnect scatter-gather list entry statistics

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system ha interconnect statistics show-scatter-gather-list` command displays the high-availability interconnect device scatter-gather list entry statistics. Out of all possible 32 entries in a scatter-gather list, the command displays only the entries that have valid data.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

| [-instance]}

Use this parameter to display all the fields from all nodes in cluster.

[-node {<nodename>|local}] - Node

Use this parameter to display all the fields from the specified node in the cluster.

[-sge <integer>, ...] - Scatter-Gather Entry

Selects the nodes that match this scatter-gather element index value.

[-total-count <integer>, ...] - Total Count

Selects the nodes that match this parameter value. The value is the total number of times a particular scatter-gather list element is used.

[-total-size <integer>, ...] - Total Size

Selects the nodes that match this parameter value. The value is the total number of bytes written by the high-availability interconnect device using a particular scatter-gather list element.

Examples

```
cluster1::*> system ha interconnect statistics show-scatter-gather-list
Node: ic-f8040-01
```

Entry	Count	Size
1	410925	77344493
2	988	1246987
3	72	747325
4	93264	1527155579
8	9	294912
9	9	294912

```
Node: ic-f8040-02
```

Entry	Count	Size
1	1544405	310004390
2	6217	16779908
3	1222	12003411
4	338606	5543436659
6	2	41980
7	2	46136
8	18	589824
9	18	589824

2 entries were displayed.

High-Availability interconnect device performance statistics

The performance directory

The `system ha interconnect statistics performance` displays the high-availability interconnect device performance statistics.

system ha interconnect statistics performance show

Display the high-availability interconnect device performance statistics

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system ha interconnect statistics performance show` command displays the high-availability interconnect device performance statistics.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

| [-instance]}

Use this parameter to display all the fields from all nodes in cluster.

[-node {<nodename>|local}] - Node

Use this parameter to display all the fields from the specified node in the cluster.

[-elapsed <integer>] - Elapsed Time (secs)

Selects the nodes that match this parameter value. Displays the total elapsed time between statistics collection start time to end time. During the initialization stage, statistics collection starts when the partner node is up and ready. After the initialization stage, the statistics collection start time is reset after every execution of this command. This means that after the initialization stage, elapsed time represents the time between current command execution and previous command execution.

[-qmax-wait <integer>] - Maximum Queue Wait Count

Selects the nodes that match this wait value. The queue maximum wait value is the total number of times the interconnect device waited to post requests on the send queue.

[-qmax-wait-time <integer>] - Average Queue Wait Time (usecs)

Selects the nodes that match this average wait time value. The queue maximum wait time is the average amount of time the interconnect device waited to post requests on the send queue.

[-qmax-timeout <integer>] - Maximum Queue Timeouts

Selects the nodes that match this parameter value. The queue maximum timeout value is the total number of times the interconnect device timed out waiting to post requests on the send queue.

[-preempt-timeout <integer>] - Preempt Timeouts

Selects the nodes that match this parameter value. The timeout value is the total number of times polling on the given transfer ID is preempted.

[-nonpreempt-timeout <integer>] - Non-Preempt Timeouts

Selects the nodes that match this parameter value. The timeout value is the total number of times polling on the given transfer ID stopped due to interconnect device read/write timeout.

[-notify-timeout <integer>] - Notify Timeouts

Selects the nodes that match this parameter value. The timeout value is the total number of times data transfer on the HA interconnect timed out.

[-avg-rnv-msgs-time <integer>] - Remote NV Messages Average Time (usecs)

Selects the nodes that match this parameter value. The value is the average time between remote NV messages.

[-rnv-transfers <integer>] - Total Remote NV Transfers

Selects the nodes that match this parameter value. The value is the total number of remote NV transfers attempted.

[-avg-rnv-transfer-size <integer>] - Remote NV Average Transfer Size

Selects the nodes that match this parameter value. The value is the average remote NV message transfer size.

[-avg-rnv-transfer-time <integer>] - Remote NV Transfers Average Time (usecs)

Selects the nodes that match this parameter value. The value is the average transfer time taken by remote NV messages.

[-ic-waits <integer>] - Total Count of IC waits for Given ID

Selects the nodes that match this parameter value. The value is the total number of times the interconnect device waits until the transfer of a given ID is successful.

[-ic-waitdone-time <integer>] - Average IC Waitdone Time (usecs)

Selects the nodes that match this parameter value. The value is the average time the interconnect device spent waiting for the IDs to be transferred successfully.

[-ic-isdone <integer>] - Total IC isdone Checks

Selects the nodes that match this parameter value. The value is the total number of times the interconnect client checked for the completion of a given transfer ID.

[-ic-isdone-pass <integer>] - Total IC isdone Checks Success

Selects the nodes that match this parameter value. The value is the total number of times the check for the completion of a given transfer ID is successful.

[-ic-isdone-fail <integer>] - Total IC isdone Checks Failed

Selects the nodes that match this parameter value. The value is the total number of times the check for the completion of a given transfer ID is not successful.

[-ic-small-writes <integer>] - IC Small Writes

Selects the nodes that match this parameter value. The value is the total number of <4K size writes performed by the interconnect device.

[-ic-4k-writes <integer>] - IC 4K Writes

Selects the nodes that match this parameter value. The value is the total number of 4K size writes performed by the interconnect device.

[-ic-8k-writes <integer>] - IC 8K Writes

Selects the nodes that match this parameter value. The value is the total number of 8K size writes performed by the interconnect device.

[-ic-16k-writes <integer>] - IC 16K+ Writes

Selects the nodes that match this parameter value. The value is the total number of 16K or more size writes performed by the interconnect device.

[-ic-xorder-writes <integer>] - IC XORDER Writes

Selects the nodes that match this parameter value. The value is the total number of out-of-order writes performed by the interconnect device.

[-ic-xorder-reads <integer>] - IC XORDER Reads

Selects the nodes that match this parameter value. The value is the total number of out-of-order reads performed by the interconnect device.

[-rdma-read <integer>] - RDMA Reads Count

Selects the nodes that match this parameter value. The value is the total number of RDMA reads performed by the interconnect device.

[-rdma-read-waitdone-time <integer>] - Average IC Waitdone RDMA-READ Time (usecs)

Selects the nodes that match this parameter value. The value is the average time the interconnect device spent polling for transfer IDs on the RDMA-read channel.

[-avg-mbytes-second <text>] - Average MegaBytes Transferred per second

Selects the nodes that match this parameter value. The value is the average megabytes (MB) transferred per second.

[-avg-bytes-transfer <integer>] - Average Bytes per Transfer

Selects the nodes that match this parameter value. The value is the average amount of bytes sent per transfer.

[-total-transfers <integer>] - Total Transfers

Selects the nodes that match this parameter value. The value is the total number of transfers made through the interconnect device.

[-avg-nvlog-sync-time <integer>] - Average Time for NVLOG Sync (msecs)

Selects the nodes that match this parameter value. The value is the average time taken to sync NVLOG between HA partner nodes.

[-max-nvlog-sync-time <integer>] - Maximum Time for NVLOG Sync (msecs)

Selects the nodes that match this parameter value. The value is the maximum time taken to sync NVLOG between HA partner nodes.

[-max-sgl-length <integer>] - Maximum Scatter-Gather Elements in a List

Selects the nodes that match this parameter value. The value is the maximum length of the scatter-gather list supported by the interconnect device.

[-ic-recq-waits <integer>] - Total Receive Queue Waits to Post Buffer

Selects the nodes that match this parameter value. The value is the total number of times the interconnect device waited to post an empty buffer into the receive queue.

[-avg-recq-wait-time <integer>] - Average Time Receive Queue Waited (usecs)

Selects the nodes that match this parameter value. The value is the average amount of time the interconnect device waited to post an empty buffer into the receive queue.

Examples

The following example displays the HA interconnect device performance statistics for FAS8000 series nodes in the cluster:

```
cluster1::*> system ha interconnect statistics performance show
                                     Node: ic-f8040-01

High-Availability interconnect device status information

The status directory

The `system ha interconnect status` directory displays the interconnect device status information. At instance level, these commands displays detailed information about the interconnect device.

system ha interconnect status show

Display the high-availability interconnect connection status

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system ha interconnect status show` command displays the high-availability interconnect connection status. Connection status information displayed by this command varies by controller model. For nodes with two HA interconnect links over the backplane or connected externally, this command displays the following information:

- Node
- Link status on the first port
- Link status on the second port
- Is the link on first port active?
- Is the link on second port active?
- Interconnect RDMA status

For nodes with a single HA interconnect link, this command displays following the information:

- Node
- Link status
- Interconnect RDMA status

Running the command with the `-instance` or `-node` parameter displays detailed information about the interconnect device and its ports.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

[-instance]

Use this parameter to display all the fields for the specified node or all the nodes.

[-node {<nodename>|local}] - Node

Use this parameter to display all the fields for the specified node.

[-link-status {up|down}] - Link Status

Selects the nodes that match this parameter value. The value *up* means link is online.

[-link0-status {up|down}] - Link 0 Status

Selects the nodes that match this parameter value. The value *up* means link is online.

[-link1-status {up|down}] - Link 1 Status

Selects the nodes that match this parameter value. The value *up* means link is online.

[-ic-rdma {up|down}] - IC RDMA Connection

Selects the nodes that match this parameter value. The value *up* means active interconnect connection with its partner.

[-is-link0-active {true|false}] - Is Link 0 Active

Selects the nodes that match this parameter value. The value *true* means the interconnect data channels are established on this link.

[-is-link1-active {true|false}] - Is Link 1 Active

Selects the nodes that match this parameter value. The value *true* means the interconnect data channels are established on this link.

[-slot <integer>] - Slot Number

Selects the nodes that match this PCI slot number.

[-driver-name <text>] - Driver Name

Selects the nodes that match this interconnect device driver name.

[-firmware <text>] - Firmware Revision

Selects the nodes that match this firmware version.

[-version <text>] - Version Number

Selects the nodes that match this parameter value.

[-device-type <text>] - Device Type

Selects the nodes that match this interconnect device type.

[-serial-number <text>] - Serial Number

Selects the nodes that match this interconnect device serial number.

[-debug-firmware {yes|no}] - Debug Firmware

Selects the nodes that match this parameter value.

[-command-revision <integer>] - Command Revision

Selects the nodes that match this interconnect device command revision.

[-hardware-revision <integer>] - Hardware Revision

Selects the nodes that match this interconnect device hardware revision.

[-port1 <integer>] - Port Number 1

Selects the nodes that match this parameter value.

[-port1-port-name <text>] - Port Name

Selects the nodes that match this port name.

[-port1-gid <text>] - Global Identifier

Selects the nodes that match this global identifier value.

[-port1-base-lid <text>] - Base Local Identifier

Selects the nodes that match this base local identifier value.

[-port1-rm-lid <text>] - Remote Local Identifier

Selects the nodes that match this remote local identifier value.

[-port1-mtu <integer>] - Maximum Transmission Unit

Selects the nodes that match this parameter value.

[-port1-data-rate <text>] - Data Rate

Selects the nodes that match this parameter value.

[-port1-link-info <text>] - Link Information

Selects the nodes that match this parameter value.

[-port1-qsfp-vendor <text>] - QSFP Vendor

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) vendor name.

[-port1-qsfp-part-number <text>] - QSFP Part Number

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) part-number.

[-port1-qsfp-type <text>] - QSFP Type

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) type.

[-port1-qsfp-serial-number <text>] - QSFP Serial Number

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) serial number.

[-port2 <integer>] - Port Number 2

Selects the nodes that match this parameter value.

[-port2-port-name <text>] - Port Name

Selects the nodes that match this port name.

[-port2-gid <text>] - Global Identifier

Selects the nodes that match this global identifier value.

[-port2-base-lid <text>] - Base Local Identifier

Selects the nodes that match this base local identifier value.

[-port2-rm-lid <text>] - Remote Local Identifier

Selects the nodes that match this remote local identifier value.

[-port2-mtu <integer>] - Maximum Transmission Unit

Selects the nodes that match this parameter value.

[-port2-data-rate <text>] - Data Rate

Selects the nodes that match this parameter value.

[-port2-link-info <text>] - Link Information

Selects the nodes that match this parameter value.

[-port2-qsfp-vendor <text>] - QSFP Vendor

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) vendor name.

[-port2-qsfp-part-number <text>] - QSFP Part Number

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) part number.

[-port2-qsfp-type <text>] - QSFP Type

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) type.

[-port2-qsfp-serial-number <text>] - QSFP Serial Number

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) serial number.

Examples

The following example displays status information about the HA interconnect connection on FAS8000 series nodes with two HA interconnect links in the cluster:

```
cluster1::*> system ha interconnect status show
```

```
      Node: ic-f8040-01
      Link 0 Status: up
      Link 1 Status: up
      Is Link 0 Active: true
      Is Link 1 Active: false
      IC RDMA Connection: up
```

```
      Node: ic-f8040-02
      Link 0 Status: up
      Link 1 Status: up
      Is Link 0 Active: true
      Is Link 1 Active: false
      IC RDMA Connection: up
```

```
2 entries were displayed.
```

The following example displays status information about the HA interconnect connection on FAS2500 series nodes with a single HA interconnect link in the cluster:

```
cluster1::*> system ha interconnect status show
```

```
      Node: ic-f2554-01
      Link Status: up
      IC RDMA Connection: up
```

```
      Node: ic-f2554-02
      Link Status: up
      IC RDMA Connection: up
```

```
2 entries were displayed.
```

The following example displays detailed information about the HA interconnect link when parameters like `-instance`, `-node` are used with the `system ha interconnect status show` command

```
cluster1::*> system ha interconnect status show -instance -node ic-f8040-01
```

```

```

system health commands

System Health Management and Diagnosis commands

system health alert commands

The alert directory

system health alert delete

Delete system health alert

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system health alert delete` command deletes all the alerts on the cluster with the specified input parameters.

Parameters

-node {<nodename>|local} - **Node**

Use this parameter to delete alerts generated on a cluster only on the node you specify.

-monitor <hm_type> - **Monitor**

Use this parameter to delete alerts generated on a cluster only on the monitor you specify.

-alert-id <text> - **Alert ID**

Use this parameter to delete alerts generated on a cluster only on the alert ID you specify.

-alerting-resource <text> - **Alerting Resource**

Use this parameter to delete alerts generated on a cluster on the alerting resource you specify.

Examples

This example shows how to delete an alert with the specified alert-id:

```
cluster1::> system health alert delete -alert-id DualPathToDiskShelf_Alert -alerting-resource *
```

system health alert modify

Modify system health alert

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system health alert modify` command suppresses alerts generated on the cluster and sets the acknowledgement state for an alert.

Parameters

-node {<nodename>|local} - **Node**

Use this parameter to specify the node on which you want to change the state.

-monitor <hm_type> - **Monitor**

Use this parameter to specify the monitor name on which you want to change the state.

-alert-id <text> - Alert ID

Use this parameter to specify the alert ID on which you want to change the state.

-alerting-resource <text> - Alerting Resource

Use this parameter to specify the alerting resource name on which you want to change the state.

[-acknowledge {true|false}] - Acknowledge

Use this parameter to set the acknowledgement state to true or false.

[-suppress {true|false}] - Suppress

Use this parameter to set the suppress state to true or false.

[-acknowledger <text>] - Acknowledger

Use this parameter to set the acknowledger as the filter for setting state.

[-suppressor <text>] - Suppressor

Use this parameter to set the suppressor as the filter for setting state.

Examples

This example modifies the alert field states on the cluster:

```
cluster1::> system health alert modify -node * -alert-id DualPathToDiskShelf_Alert -suppress true
```

system health alert show

View system health alerts

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system health alert show` command displays information about all the alerts generated on the system. Using `-instance` will add detailed information.

Parameters

{ [-fields <fieldname>, ...]

Selects the fields that you specify.

| [-instance]}

Displays the following additional information about each alert:

- Node name
- Resource name
- Severity of the alert
- Time of alert generation
- Suppress state of the alert
- Acknowledge state of the alert
- Probable cause for the alert
- Possible effect due to the alert
- Recommended corrective actions to follow

[-node {<nodename>|local}] - Node

Selects the alerts generated for the specified node.

[-monitor <hm_type>] - Monitor

Selects the alerts with the specified monitor name.

[-alert-id <text>] - Alert ID

Selects the alerts with the specified alert ID.

[-alerting-resource <text>] - Alerting Resource

Selects the alerts with the specified alerting resource name.

[-subsystem <hm_subsystem>] - Subsystem

Selects the alerts generated on the monitoring subsystem.

[-indication-time <Date>] - Indication Time

Selects the alerts with the specified indicated time.

[-perceived-severity <hm_perceived_sev>] - Perceived Severity

Selects the alerts with the perceived severity level.

[-probable-cause <hm_probable_cause>] - Probable Cause

Selects the alerts that contain the specified probable cause.

[-probable-cause-description <text>] - Description

Selects the alerts containing the specified probable cause description.

[-corrective-actions <text>] - Corrective Actions

Selects the alerts with the specified recommended corrective action.

[-possible-effect <text>] - Possible Effect

Selects the alerts with the specified possible effect.

[-acknowledge {true|false}] - Acknowledge

Selects the alerts with the specified acknowledgement status.

[-suppress {true|false}] - Suppress

Selects the alerts with the specified suppressor field status of true or false.

[-policy <text>] - Policy

Selects the alerts with the specified policy name.

[-acknowledger <text>] - Acknowledger

Selects the alerts with the specified acknowledger field.

[-suppressor <text>] - Suppressor

Selects the alerts with the specified suppressor field.

[-additional-info <text>, ...] - Additional Information

Selects the alerts with the specified additional information.

[-alerting-resource-name <text>] - Alerting Resource Name

Selects the alerts with the specified alerting resource name.

[-tags <hm_alert_type>, ...] - Additional Alert Tags

Selects the alerts with the specified keywords.

Examples

The example below displays information about all the alerts generated in the cluster:

```
cluster1::> system health alert show

Node: node1
Resource: Shelf ID 2
Severity: Major
Suppress: false
Acknowledge: false
Tags: quality-of-service, nondisruptive-upgrade
Probable Cause: Disk shelf 2 does not have two paths to controller
node1.
Possible Effect: Access to disk shelf 2 via controller node1 will be
lost with a single hardware component failure (e.g.
cable, HBA, or IOM failure).
```

Corrective Actions: 1. Halt controller node1 and all controllers attached to disk shelf 2.
 2. Connect disk shelf 2 to controller node1 via two paths following the rules in the Universal SAS and ACP Cabling Guide.
 3. Reboot the halted controllers.
 4. Contact support personnel if the alert persists.

The example below displays additional information about a specific alert generated in the cluster:

```
cluster1::> system health alert show -monitor node-connect -alert-id DualPathToDiskShelf_Alert -instance

Node: node1
Monitor: node-connect
Alert ID: DualPathToDiskShelf_Alert
Alerting Resource: 50:05:0c:c1:02:00:0f:02
Subsystem: SAS-connect
Indication Time: Mon Mar 21 10:26:38 2011
Perceived Severity: Major
Probable Cause: Connection_establishment_error
Description: Disk shelf 2 does not have two paths to controller node1.
Corrective Actions: 1. Halt controller node1 and all controllers attached to disk shelf 2.
                   2. Connect disk shelf 2 to controller node1 via two paths following the rules in the Universal SAS and ACP Cabling Guide.
                   3. Reboot the halted controllers.
                   4. Contact support personnel if the alert persists.
Possible Effect: Access to disk shelf 2 via controller node1 will be lost with a single hardware component failure (e.g. cable, HBA, or
Acknowledge: false
Suppress: false
Policy: DualPathToDiskShelf_Policy
Acknowledger: -
Suppressor: -
Additional Information: Shelf uuid: 50:05:0c:c1:02:00:0f:02
                      Shelf id: 2
                      Shelf Name: 4d.shelf2
                      Number of Paths: 1
                      Number of Disks: 6
                      Adapter connected to IOMA:
                      Adapter connected to IOMB: 4d
Alerting Resource Name: Shelf ID 2
Additional Alert Tags: quality-of-service, nondisruptive-upgrade
```

system health alert definition commands

The definition directory

system health alert definition show

Display system health alert definition

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system health alert definition show` command displays information about the various alerts defined in the system health monitor policy file. Using `-instance` will display additional details.

Parameters

{ **[-fields <fieldname>, ...]**

Selects the fields that you specify.

| **[-instance]**

Use this parameter to display additional information on each alert definition.

- Node name
- Monitor name
- Subsystem identifier
- Alert ID

- Severity of the alert
- Probable cause
- Probable cause description
- Possible effect due the error state
- Recommended corrective actions to be followed
- Any additional information
- Additional alert tags

[-node <nodename>|local]] - Node

Selects the alert definitions for the specified node.

[-monitor <hm_type>] - Monitor

Selects the alert definitions with the specified monitor name.

[-alert-id <text>] - Class of Alert

Selects the alert definitions with the specified alert identifier.

[-perceived-severity <hm_perceived_sev>] - Severity of Alert

Selects the alert definitions with the specified perceived severity.

[-probable-cause <hm_probable_cause>] - Probable Cause

Selects the alert definitions with the specified probable cause of the alert.

[-probable-cause-description <text>] - Probable Cause Description

Selects the alert definitions with the specified probable cause description.

[-possible-effect <text>] - Possible Effect

Selects the alert definitions with the specified possible effect.

[-corrective-actions <text>] - Corrective Actions

Selects the alert definitions with the specified corrective action.

[-subsystem <hm_subsystem>] - Subsystem Name

Selects the alert definitions with the specified subsystem.

[-additional-information <text>] - Additional Relevant Data

Selects the alert definitions with the specified additional information.

[-tags <hm_alert_type>, ...] - Additional Alert Tags

Selects the alert definitions with the specified keywords.

Examples

The example below displays information about all the definitions in the alert definition file:

```
cluster1::> system health alert definition show
Node      Monitor      Subsystem      Alert ID
-----
node-01    system-connect  SAS-connect    DualControllerNonHa_
                        Severity: Major
                        Probable Cause: Configuration_error
Probable Cause Description: Disk shelf $(sschm_shelf_info.id) is connected to
                        two controllers
                        $(sschm_shelf_info.connected-nodes)) that are
                        not an HA pair.
Possible Effect: Access to disk shelf $(sschm_shelf_info.id) may
                        be lost with a single controller failure.
Corrective Actions: 1. Halt all controllers that are connected to disk shelf $(sschm_shelf_info.id).
                        2. Connect disk shelf $(sschm_shelf_info.id) to both HA controllers following the rules in the Universal SAS and AD
                        3. Reboot the halted controllers.
                        4. Contact support personnel if the alert persists.
Additional Info: -
                        Tags: quality_of_service, nondisruptive-upgrade
```

The example below displays detailed information about the definitions in the alert definition file:

```
cluster1::> system health alert definition show -instance
```

```
Node: krivC-01
Monitor: system-connect
Class of Alert: DualControllerNonHa_Alert
Severity of Alert: Major
Probable Cause: Configuration_error
Probable Cause Description: Disk shelf $(sschm_shelf_info.id) is connected to two controllers ($(sschm_shelf_info.connected-nodes)) that are n
Possible Effect: Access to disk shelf $(sschm_shelf_info.id) may be lost with a single controller failure.
Corrective Actions: 1. Halt all controllers that are connected to disk shelf $(sschm_shelf_info.id).
2. Connect disk shelf $(sschm_shelf_info.id) to both HA controllers following the rules in the Universal SAS and ACP Cabling Guide.
3. Reboot the halted controllers.
4. Contact support personnel if the alert persists.
Subsystem Name: SAS-connect
Additional Relevant Data: -
Additional Alert Tags: quality_of_service, nondisruptive-upgrade
```

system health autosupport commands

The autosupport directory

system health autosupport trigger commands

The trigger directory

system health autosupport trigger history commands

The history directory

system health autosupport trigger history show

View system health alert history

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system health autosupport trigger history show` command displays all the alert triggers in the cluster that generated the AutoSupport messages. The following fields are displayed in the output:

- Node name
- Monitor name
- Subsystem
- Alert identifier
- Alerting resource
- Severity
- If an AutoSupport has been sent due to this alert

Parameters

`{ [-fields <fieldname>, ...]`

Use this parameter to display only the fields you specify.

`| [-instance ]]`

Use this parameter to display additional information about all of the alerts that were generated.

`[-node {<nodename>|local}] - Node`

Use this parameter to display AutoSupport trigger history on the specified node.

[-monitor <hm_type>] - Monitor

Use this parameter to display AutoSupport trigger history with the specified monitor name.

[-alert-id <text>] - Alert ID

Use this parameter to display the AutoSupport message that was triggered by the specified alert ID.

[-alerting-resource <text>] - Alerting Resource

Use this parameter to display the AutoSupport message that was triggered by the specified alerting resource.

[-subsystem <hm_subsystem>] - Subsystem

Use this parameter to display the AutoSupport message that was triggered by the specified subsystem.

[-indication-time <Date>] - Indication Time

Use this parameter to display the AutoSupport message that was triggered at the indicated time.

[-perceived-severity <hm_perceived_sev>] - Perceived Severity

Use this parameter to display the AutoSupport message that was triggered by alerts with the specified perceived severity.

[-autosupport-triggered {true|false}] - AutoSupport Triggered

Use this parameter to display the alerts that generated AutoSupport messages.

[-probable-cause <hm_probable_cause>] - Probable Cause

Use this parameter to display the alerts that were generated with the specified probable cause.

[-corrective-actions <text>] - Corrective Actions

Use this parameter to display the AutoSupport alerts with the specified corrective actions.

[-asup-enable {true|false}] - Enable Asup for This Alert

Use this parameter to enable or disable an AutoSupport message for this alert.

[-alert-clear-time <Date>] - Alert Clear Time

Use this parameter to display the alerts that were cleared at a given time.

Examples

This example displays information about the AutoSupport trigger history

```
cluster1::> system health autosupport trigger history show
Node      Monitor      Subsystem      Alert ID
-----
node1     node-connect  SAS-connect    DualPathToDiskShelf_
                        Alert
Resource: 50:05:0c:c1:02:00:0f:02
Severity: Major
AutoSupport sent: true
```

This example displays info about the autosupport trigger history in detail

```
cluster1::> system health autosupport trigger history show -instance
Node: node1
Monitor: node-connect
Alert ID: DualPathToDiskShelf_Alert
Alerting Resource: 50:05:0c:c1:02:00:0f:02
Subsystem: SAS-connect
Indication Time: Thu Mar 17 11:59:09 2011
Perceived Severity: Major
AutoSupport Triggered: true
Probable Cause: Connection_establishment_error
Corrective Actions: 1. Halt controller node1 and all controllers attached to disk shelf 2.
2. Connect disk shelf 2 to controller node1 via two paths following the rules in the Universal SAS and ACP Cabling Guide.
3. Reboot the halted controllers.
4. Contact support personnel if the alert persists.
Enable asup for this alert: true
```

system health config commands

The config directory

system health config show

Display system health configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system health config show` command displays the configuration and status of each health monitor in the cluster. The command shows a health status for each health monitor. The health status is an aggregation of the subsystem health for each subsystem that the health monitor monitors. For example, if a health monitor monitors two subsystems and the health status of one subsystem is "ok" and the other is "degraded", the health status for the health monitor is "degraded".

Parameters

[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Use this parameter to list the health monitors present on the specified node.

[-monitor <hm_type>] - Monitor

Use this parameter to display the health monitors with the specified monitor name.

[-subsystem <hm_subsystem>, ...] - Subsystem

Selects the health monitors with the specified subsystems.

[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Health

Selects the health monitors with the specified health status.

[-mon-version <text>] - Monitor Version

Selects the health monitors with the specified monitor version.

[-pol-version <text>] - Policy File Version

Selects the health monitors with the specified health monitor policy version.

[-context {Node |Cluster}] - Context

Selects the health monitors with the specified running context.

[-aggregator <hm_type>] - Aggregator

Selects the health monitors with the specified aggregator.

[-resources <text>, ...] - Resource

Selects the health monitors with the specified resource name.

[-init-state {Invalid|Initailizing|Initialized|Starting_Discovery|Starting_Re-Discovery|Discovery_Done_Partially|Discovery_Done}] - Subsystem Initialization Status

Selects the health monitors with the specified subsystem initialization state.

[-sub-pol-versions <text>] - Subordinate Policy Versions

Selects the health monitors with the specified subordinate policy version.

Examples

The example below displays information about health monitor configuration:

```
cluster1::> system health config show
Node      Monitor      Subsystem      Health
-----
node1     node-connect   SAS-connect    degraded
node1     system-connect SAS-connect    degraded
node1     system        SAS-connect    degraded
```

The example below displays detailed information about health monitor configuration:

```
cluster1::> system health config show -instance
Node: node1
Monitor: node-connect
Subsystem: SAS-connect
Health: degraded
Monitor Version: 1.0
Policy File Version: 1.0
Context: node_context
Aggregator: system-connect
Resource: SasAdapter, SasDisk, SasShelf
Subsystem Initialization Status: initialized
Subordinate Policy Versions: 1.0 SAS, 1.0 SAS multiple adapters
```

system health policy commands

The policy directory

system health policy definition commands

The definition directory

system health policy definition modify

Modify system health policy definition

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system health policy definition modify` enables or disables health monitoring policies based on input parameters the user provides.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the node on which you want to enable or disable the policy.

-monitor <hm_type> - Monitor

Use this parameter to specify the monitor name for which you want to be enable or disable the policy.

-policy-id <text> - Policy

Use this parameter to specify the policy identifier that you want to enable or disable.

[-enable {true|false}] - Policy Status

Use this parameter with the value "true" to enable the policy. Set the value to "false" to disable the policy.

[-asup-enable {true|false}] - Enable AutoSupport for This Alert

Use this parameter to enable or disable an AutoSupport message for this alert.

Examples

This example modifies policy state on the cluster:

```
cluster1::> system health policy definition modify -node node1
            -policy-id ControllerToShelfIomA_Policy -enable false -monitor *
```

system health policy definition show

Display system health policy definitions

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system health policy definition show` command lists the health monitor policy definitions as described by the health monitor policy file. The command displays the following fields:

- Node name
- Monitor name
- Policy name
- Policy rule expression
- Expression for joining two tables
- Policy status
- Alert identifier
- Responsible resource name

Parameters

[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects policy definitions for the specified node.

[-monitor <hm_type>] - Monitor

Selects policy definitions with the specified monitor name.

[-policy-id <text>] - Policy

Selects policy definitions with the specified policy identifier.

[-rule-expression <ArithExpr>] - Rule Expression

Selects policy definitions with the specified rule of expression.

[-where <ArithExpr>] - Variable Equivalence

Selects rules that match the provided expression. This expression is part of the alert definition. It is shown for reference only and cannot be changed.

[-enable {true|false}] - Policy Status

Use this parameter with the value set to "true" to select policy definitions that are enabled. Set the value to "false" to select policy definitions that are disabled.

[-alert-id <text>] - Alert ID

Selects all policy definitions of the specified alert identifier.

[-responsible-resource-info <text>] - Table and ID of Resource at Fault

Selects all policy definitions with the specified responsible resource.

[-asup-enable {true|false}] - Enable AutoSupport for This Alert

Selects policy definitions for which AutoSupport messages are either enabled or disabled.

Examples

The example below displays information about all the policy definitions present in the cluster:

```
cluster1::> system health policy definition show
Node      Monitor      Policy
-----
node1     node-connect    ControllerToShelfIomA_Policy
Policy Rule Expression: nschm_shelf_info.num-paths == 2 &&
                        nschm_shelf_info.iomb-adapter == NULL
      Where: -
      Enable: true
      Alert ID: ControllerToShelfIomA_Alert
      Number of Alerts: -
      Responsible Resource: nschm_shelf_info.name
```

The example below displays detailed information about all the policy definitions present in the cluster:

```
cluster1::> system health policy definition show -instance

      Node: node1
      Monitor: node-connect
      Policy: ControllerToShelfIomA_Policy
      Rule Expression: nschm_shelf_info.num-paths == 2 && nschm_shelf_info.iomb-adapter == NULL
      Variable Equivalence: -
      Policy Status: true
      Alert ID: ControllerToShelfIomA_Alert
      Table and ID of Resource at Fault: nschm_shelf_info.name
```

system health status commands

The status directory

system health status show

Display system health monitoring status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system health status show` command displays the health monitor status. The possible states are:

- ok
- ok-with-suppressed
- degraded
- unreachable

Examples

This example displays information about health monitoring status:

```
cluster1::> system health status show
Status
-----
degraded
```

system health subsystem commands

The subsystem directory

system health subsystem show

Display the health of subsystems

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system health subsystem show` command displays the health status of each subsystem for which health monitoring is available. This command aggregates subsystem health status from each node in the cluster. A subsystem's health status changes to "degraded" when a health monitor raises an alert. You can use the ["system health alert show" on page 1127](#) command to display information about generated alerts.

Parameters

[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-subsystem <hm_subsystem>] - Subsystem

Selects the specified subsystem.

[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Health

Selects subsystems that have the specified health status.

[-init-state {Invalid|Initailizing|Initialized|Starting_Discovery|Starting_Re-Discovery|Discovery_Done_Partially|Discovery_Done}] - Initialization State

Selects subsystems that have the specified initialization state.

[-outstanding-alert-count <integer>] - Number of Outstanding Alerts

Selects subsystems that have the specified number of outstanding alerts.

[-suppressed-alert-count <integer>] - Number of Suppressed Alerts

Selects subsystems that have the specified number of suppressed alerts.

[-node {<nodename>|local}, ...] - Node

Selects subsystems for the specified node.

[-refresh-interval <[<integer>h][<integer>m][<integer>s]>, ...] - Subsystem Refresh Interval

The refresh interval is in minutes. A value of zero disables the sub-system refresh until a reboot or restart of the subsystem process.

Examples

The example below displays the health status of each subsystem:

```
cluster1::> system health subsystem show
Subsystem      Health
-----
SAS-connect    degraded
Switch-Health  OK
CIFS-NDO       OK
```

The example below displays detailed information about the health status of each subsystem:

```
cluster1::> system health subsystem show -instance

Subsystem: SAS-connect
```

```

Health: degraded
  Initialization State: initialized
Number of Outstanding Alerts: 0
Number of Suppressed Alerts: 0
    Node: node1,node2
Subsystem Refresh Interval: 30m, 30m

Subsystem: Switch-Health
Health: ok
  Initialization State: initialized
Number of Outstanding Alerts: 0
Number of Suppressed Alerts: 0
    Node: node1
Subsystem Refresh Interval: 5m

Subsystem: CIFS-NDO
Health: OK
  Initialization State: initialized
Number of Outstanding Alerts: 0
Number of Suppressed Alerts: 0
    Node: node1
Subsystem Refresh Interval: 5m

```

system license commands

Manage licenses

system license add

Add one or more licenses

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command adds a license to a cluster. To add a license you must specify a valid license key, which you can obtain from your sales representative.

Parameters

-license-code <License Code V2>, ... - **License Code V2**

This parameter specifies the key of the license that is to be added to the cluster. The parameter accepts a list of 28 digit upper-case alphanumeric character keys.

Examples

The following example adds a list of licenses with the keys AAAAAAAAAAAAAAAAAAAAAAAAAAAAAA and BBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBB to the cluster

```
cluster1::> system license add -license-code AAAAAAAAAAAAAAAAAAAAAAAAAAAAAA, BBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBB
```

system license clean-up

Remove unnecessary licenses

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command manages licenses in the cluster that have no effect, and so can be removed. Licenses that have expired or are not affiliated with any controller in the cluster are deleted by this command.

Parameters

[-unused *[true]*] - Remove unused licenses

If you use this parameter, the command removes licenses in the cluster that are not affiliated with any controller in the cluster.

[-expired *[true]*] - Remove expired licenses

If you use this parameter, the command removes licenses in the cluster that have expired.

[-simulate | -n *[true]*] - Simulate Only

If you use this parameter, the command will not remove the licenses. Instead it will display the licenses that will be removed if this parameter was not provided.

Examples

The following example simulates and displays the licenses that can be cleaned up:

```
cluster1::> system license clean-up -n -unused -expired
Serial number: 1-80-000011
Owner: cluster1
Package          Reason
-----
SnapLock         Demo License has expired
SnapProtectApps  Demo License has expired

Serial number: 1-81-00000000000000004062522917
Owner: none
Package          Reason
-----
NFS              Serial number is not used by any node in the cluster
CIFS             Serial number is not used by any node in the cluster
```

The following example deletes the expired licenses:

```
cluster1::> system license clean-up -expired
2 demo licenses deleted.
```

The following example deletes the unused licenses:

```
cluster1::> system license clean-up -unused
2 unused licenses deleted.
```

system license delete

Delete a license

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command deletes a license from a cluster.

Parameters

-serial-number *<text>* - Serial Number

This parameter specifies the serial number of the license that is to be deleted from the cluster. If this parameter is not provided, the default value is the serial number of the cluster.

-package *<Licensable Package>* - Package

This parameter specifies the name of the package that is to be deleted from the cluster.

Examples

The following example deletes a license named CIFS and serial number 1-81-0000000000000000000123456 from the cluster:

```
cluster1::> system license delete -serial-number 1-81-00000000000000000000123456 -package CIFS
```

system license show

Display licenses

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system license show` command displays the information about licenses in the system.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-serial-number <text>] - Serial Number

If you use this parameter, the command displays information only about the licenses that matches the serial number you specify.

[-package <Licensable Package>] - Package

If you use this parameter, the command displays information only about the specified package.

[-owner <text>] - Owner

If you use this parameter, the command displays information only about the packages that matches the owner name you specify.

[-expiration <MM/DD/YYYY HH:MM:SS>] - Expiration

If you use this parameter, the command displays information only about the licenses that have the expiration date you specify.

[-description <text>] - Description

If you use this parameter, the command displays information only about the licenses that matches the description you specify.

[-type {license|site|demo|subscr|capacity}] - Type

If you use this parameter, the command displays information only about the licenses that have the license type you specify.

[-legacy {yes|no}] - Legacy

If you use this parameter, the command displays information only about the licenses that matches the legacy field you specify.

[-customer-id <text>] - Customer ID

If you use this parameter, the command displays information only about the licenses that have the customer-id you specify.

Examples

The following example displays default information about all licensed packages in the cluster:

```
cluster1::> system license show
Serial Number: 1-80-123456
Owner: cluster1
Package      Type      Description      Expiration
-----
Base         site      Cluster Base License  -
NFS          site      NFS License       -
iSCSI        site      iSCSI License      -
```

```

Serial Number: 1-81-0000000000000001122334455
Owner: node1
Package      Type      Description      Expiration
-----
NFS           license NFS License      -
SnapRestore   license SnapRestore License -
5 entries were displayed.

```

system license show-status

Display license status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the status of all Data ONTAP licenses.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-status {not-compliant|eval|partially-installed|valid|not-installed|not-applicable}] - Current state

If you use this parameter, the command displays information only about licenses that match the given status.

[-license <Licensable Package>] - License

If you use this parameter, the command displays information only about licenses that match the given license.

[-scope {site|cluster|node}] - License Scope

If you use this parameter, the command displays information only about licenses that match the given scope.

[-detailed-status <text>, ...] - Detailed Status

If you use this parameter, the command displays information only about licenses that match the given detailed-status.

Examples

The following example displays the license status of the cluster:

```

cluster1::> system license show-status
Status      License      Scope      Detailed Status
-----
partially-installed
      CIFS      node      License missing on: Node2-Cluster1.
      SnapRestore node      License missing on: Node2-Cluster1.
valid
      FCP      node      -
      FabricPool cluster The system is using 1TB, and can use up to 25TB.
not-installed
      NFS      -      -
      iSCSI     -      -
      SnapMirror -      -
      FlexClone -      -
      SnapVault -      -
      SnapLock  -      -
      SnapManagerSuite -      -
      SnapProtectApps -      -
      V_StorageAttach -      -

```

system license capacity commands

(DEPRECATED)-The capacity directory

system license capacity show

(DEPRECATED)-Show license capacity status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command is deprecated and may be removed in a future release of Data ONTAP. Use the "["system license show-status" on page 1141](#)" command.

The `system license capacity show` command displays the information about the licenses in the system that are specifically related to storage capacity limits.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-serial-number <Node Serial Number>] - Serial Number

If you use this parameter, the command displays information only about the capacity-related licenses that matches the serial number you specify.

[-package <Licensable Package>] - Package

If you use this parameter, the command displays information only about the package you specify.

[-owner <text>] - Owner

If you use this parameter, the command displays information only about the capacity-related licenses that have the owner you specify.

[-max-capacity {<integer>[KB|MB|GB|TB|PB]]] - Maximum Capacity

If you use this parameter, the command displays information only about the capacity-related licenses that have the maximum amount of attached storage capacity you specify.

[-current-capacity {<integer>[KB|MB|GB|TB|PB]]] - Current Capacity

If you use this parameter, the command displays information only about the capacity-related licenses that apply to the node with the current attached capacity you specify.

[-expiration <MM/DD/YYYY HH:MM:SS>] - Expiration Date

If you use this parameter, the command displays information only about the capacity-related licenses that have the expiration date you specify.

[-reported-state {evaluation|warning|missing|enforcement|installed}] - Reported State

If you use this parameter, the command displays information only about the capacity-related licenses that have the reported state you specify.

[`-node {<nodename>|local}`]] - Node Name

If you use this parameter, the command displays information only about the capacity-related licenses that apply to the node you specify.

Examples

The following example displays information about all capacity-related licensed packages in the cluster, for a hypothetical cluster of four nodes:

Note that for some nodes below, the maximum capacity is displayed as "-" (meaning "unlimited"). This happens when there is no capacity license for the node - the node is operating with a limited-time temporary capacity license.

```
cluster1::> system license capacity show
```

```
Node:          node1
Serial Number: 1-81-00000000000001234567890123456
                Max  Current
Package          Capacity Capacity Expiration
-----
Select          2TB   15.81GB 4/11/2016 00:00:00
```

```
Node:          node2
Serial Number: 1-81-000000000000000000000123456788
                Max  Current
Package          Capacity Capacity Expiration
-----
Select          -    10.40TB 4/11/2016 00:00:00
```

```
Node:          node3
Serial Number: 1-81-000000000000000000000123456789
                Max  Current
Package          Capacity Capacity Expiration
-----
Select          -    10.40TB 4/11/2016 00:00:00
```

```
Node:          node4
Serial Number: 1-81-00000000000001234567890123456
                Max  Current
Package          Capacity Capacity Expiration
-----
Select          2TB   15.81GB 4/11/2016 00:00:00
```

system license entitlement-risk commands

The entitlement-risk directory

system license entitlement-risk show

Display Cluster License Entitlement Risk

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays information about license entitlement risk of the cluster for each license package. The command displays license package name, entitlement risk, corrective action to reduce the entitlement risk for each package, and the names and serial numbers for the nodes that do not have a node-locked license for a given package. If command is used with the "-detail" parameter, the output displays the names and serial numbers for all nodes in the cluster instead of only the nodes missing a node-locked license. It also displays whether each node has a license and if the features corresponding to the package are used in the past week.

License entitlement risk does not apply to base license. If a node has a site or a valid demo license for the given package, the entitlement risk will be shown as "medium" and the nodes missing a node-locked license will be displayed. The corrective action, if the cluster has a site license for the given package is, "Verify all controllers are entitled". If the entitlement risk is high, the corrective action is "Acquire node-locked license". For the low entitlement risk and if the cluster is unlicensed for a given package, the corrective action is "None". If the license entitlement risk cannot be computed because of infrastructure issues, the entitlement risk is shown as "unknown" and the corrective action is displayed as "Verify system health".

For more information regarding license entitlement risk, see <https://datacentersupport.lenovo.com/>.

Parameters

{ [-fields <fieldname>, ...]

With this parameter, you can specify which fields should be displayed by the command. License package names and node serial numbers are always displayed.

[-detail]

If you use this parameter, the command displays the license package name, entitlement risk, corrective action, all nodes' names, their serial numbers, whether a node-locked license is present and whether a given license package has been in use in the past week for each node in the cluster.

[-instance]

If this parameter is used, the command displays values for all fields for each license package and each node in the cluster individually.

[-package <Licensable Package>] - Package Name

If you use this parameter, the command displays information only for the specified license package.

[-serial-number <text>] - Node Serial Number

If you use this parameter, the command displays information only for the node with the specified serial number. The displayed entitlement risk and corrective action apply to the entire cluster.

[-node-name <text>] - Node Name

If you use this parameter, the command displays information only for the node with the specified name. The displayed entitlement risk and corrective action apply to the entire cluster.

[-risk {high|medium|low|unlicensed|unknown}] - Entitlement Risk

If you use this parameter, the command displays information only for the license packages that have the specified license entitlement risk.

[-action <text>] - Corrective Action

If you use this parameter, the command displays information only for the license packages which need the specified corrective action to reduce entitlement risk.

[-is-licensed {true|false}] - Is Node-Locked License Present

If you use this parameter, the command displays information only for the license packages for which at least one node in the cluster has a node-locked license. It also displays the nodes in the cluster which do not have a node-locked license.

[-in-use {true|false}] - Usage Status

If you use this parameter, the command displays information only for the license packages with corresponding features in use.

[-missing-serial-numbers <text>, ...] - Serial Numbers Missing a Node-Locked License

If you use this parameter, the command displays the packages for which the node with the specified serial number does not have a node-locked license.

[-missing-node-names <text>, ...] - Node Names Missing a Node-Locked License

If you use this parameter, the command displays all the packages for which the node with the specified name does not have a node-locked license.

[-action-code {*acquire-license|adjust-capacity|verify-entitlement|verify-system-health|none*}] - Corrective Action Code

If you use this parameter, the command displays information only for the license packages which need specified corrective action code to reduce entitlement risk. This parameter is same as the parameter "action".

Examples

The following example displays the information for license package NFS. NFS is unlicensed in the cluster and no action is necessary to reduce the entitlement risk. The nodes, cluster1-01 and cluster1-02, are missing a node-locked license. The serial numbers for both nodes are also displayed.

```
cluster1:~# system license entitlement-risk show
Package                               Entitlement Risk Corrective Action
-----
NFS                                   unlicensed          None
                                   Nodes Without a Node-Locked License
cluster1-01                          1-81-0000000000000004073806282
cluster1-02                          1-81-0000000000000004073806283
```

The following example displays the information for license package CIFS. The cluster has high entitlement risk for CIFS. The command displays serial numbers for all nodes in the cluster. Both nodes are missing a node-locked CIFS license. Node with serial number 1-81-0000000000000004073806282 has used CIFS feature in the past week, and the node with serial number 1-81-0000000000000004073806283 has not used this feature in the past week.

Package	Entitlement Risk	Corrective Action
CIFS	high	Acquire a node-locked license
		Serial Numbers Licensed Usage
		1-81-0000000000000004073806282 false true
		1-81-0000000000000004073806283 false false

system license status commands

(DEPRECATED)-Display license status

system license status show

(DEPRECATED)-Display license status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command is deprecated and may be removed in a future release of Data ONTAP. Use the "[system license show-status](#)" on page 1141" command.

This command displays the list of licensable packages in the system and their current licensing status.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-package` <Licensable Package>] - Package Name

If you use this parameter, the command displays information only about the specified package.

[`-method` {*none*|*license*|*site*|*demo*|*subscr*|*capacity*}] - Licensed Method

If you use this parameter, the command displays information only about the packages with the specified licensed method.

[`-expiration` <MM/DD/YYYY HH:MM:SS>] - Expiration Date

If you use this parameter, the command displays information only about the licenses that have the expiration date you specify.

[`-description` <text>] - Description

If you use this parameter, the command displays information only about the licenses that match the description you specify.

[`-status-details` <text>] - Additional Information About Status

This option displays additional information regarding the cluster-level license status for license methods.

Examples

The following example displays the license status of the cluster:

```
cluster1::> system license status show
Package           Licensed Method  Expiration           Status Details
-----
Base              site            -                    -
NFS               site            -                    -
CIFS              demo            12/7/2015 00:00:00   Demo expires on given date
iSCSI             none            -                    -
FCP              none            -                    -
SnapRestore       none            -                    -
SnapMirror        none            -                    -
FlexClone         none            -                    -
SnapVault         none            -                    -
SnapLock          none            -                    -
SnapManagerSuite  none            -                    -
SnapProtectApps   none            -                    -
V_StorageAttach   none            -                    -
SnapLock_Enterprise
none              -                -                    -
Insight_Balance   none            -                    -
OCShift           none            -                    -
Cloud             subscr          12/15/2015 00:00:00   Subscription expires on given date
17 entries were displayed.
```

system node commands

The system node directory

system node halt

Shut down a node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node halt` command stops all activity on a node. You may supply a reason for the shutdown, which will be stored in the audit log. You may also keep partner nodes from performing storage takeover during the shutdown.

Parameters

-node {<nodename>|local} - Node

Use this mandatory parameter to specify the node that you want to shut down. The value `local` specifies the current node.

[-reason <text>] - Reason for Shutdown

Use this parameter to enter a brief note to indicate the reason for the restart, which will be stored in the audit log. Providing this information assists support personnel with troubleshooting efforts.

[-inhibit-takeover | -f [true]] - Disallow Storage Takeover by Partner

This parameter optionally forces the shutdown and prevents storage failover. In a two-node MetroCluster configuration, this parameter prevents automatic unplanned switchover.

Note: If `-inhibit-takeover` is set to `true`, the default behavior as seen with command [“storage failover show” on page 913](#) -fields `onreboot` is ignored.

If you enter this command without using this parameter, its effective value is `false` and storage takeover is allowed. If you enter this parameter without a value, it is automatically set to `true` and storage takeover is disabled during reboot.

[-dump | -d [true]] - Create a Core Dump

If this parameter is set to `true`, it forces a dump of the kernel core when halting the node.

[-skip-lif-migration-before-shutdown [true]] - Skip Migrating LIFs Away from Node Prior to Shutdown

If this parameter is specified, LIF migration prior to the shutdown will be skipped. However if LIFs on this node are configured for failover, those LIFs may still failover after the shutdown has occurred. The default is to migrate LIFs prior to the shutdown. In the default case, the command attempts to synchronously migrate data and cluster management LIFs away from the node prior to shutdown. If the migration fails or times out, the shutdown will be aborted.

[-ignore-quorum-warnings [true]] - Skip Quorum Check Before Shutdown

If this parameter is specified, quorum checks will be skipped prior to the shutdown. The operation will continue even if there is a possible data outage due to a quorum issue.

Examples

The following example shuts down the node named `cluster1` for hardware maintenance:

```
cluster1::> system halt -node cluster1 -reason 'hardware maintenance'
```

system node migrate-root

Start the root aggregate migration on a node

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system node migrate-root` command migrates the root aggregate of a node to a different set of disks. You need to specify the node name and the list of disks on which the new root aggregate will be created. The command starts a job that backs up the node configuration, creates a new aggregate, set it as new root aggregate, restores the node configuration and restores the names of original aggregate and volume. The job might take as long as a few hours depending on time it takes for zeroing the disks, rebooting the node and restoring the node configuration.

Parameters

-node {<nodename>|local} - Node

Specifies the node that owns the root aggregate that you wish to migrate. The value `local` specifies the current node.

{ -disklist <disk path name>, ... - List of Disks for New Root Aggregate

Specifies the list of disks on which the new root aggregate will be created. All disks must be spares and owned by the same node. Minimum number of disks required is dependent on the RAID type.

-raid-type {raid_tec|raid_dp|raid4} - RAID Type for the New Root Aggregate

Specifies the RAID type of the root aggregate. The default value is *raid-dp*.

| -resume [true]} - Resume a Failed Migrate Operation

Resumes a failed migrate-root operation if the new_root aggregate is created and the old root aggregate is in the retracted state.

Examples

The command in the following example starts the root aggregate migration on node node1:

```
cluster1::> system node migrate-root -node node1 -disklist 1.11.8,1.11.9,1.11.10,1.11.11,1.11.12 -raid-type raid-dp
```

system node modify

Modify node attributes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node modify` command sets the attributes of a node.

The owner, location, and asset tag attributes are informational only, and do not affect the operation of the node or the cluster. The cluster eligibility attribute marks a node as eligible to participate in a cluster. The epsilon attribute marks a node as the tie-breaker vote if the cluster has an even number of nodes.

Any field of type <text> may be set to any text value. However, if the value contains spaces or other special characters, you must enter it using double-quotes as shown in the example below.

Use the [“system node show” on page 1153](#) command to display the field values that this command modifies.

Parameters

-node {<nodename>|local} - Node

This mandatory parameter specifies which node will have its attributes modified. The value "local" specifies the current node.

[-owner <text>] - Owner

This optional text string identifies the node's owner. Fill it in as needed for your organization.

[-location <text>] - Location

Use this text string to identify the physical location of the node. This text string is optional; fill it in as needed for your organization.

[-assettag <text>] - Asset Tag

If your organization uses asset tags to track equipment, you can use this text string to store that tag's value.

[-eligibility {true|false}] - Eligibility (privilege: advanced)

This parameter specifies whether the node is eligible to participate in a cluster. If you modify another node's eligibility to false, it will no longer be visible from other nodes in the cluster. If you modify the local node's eligibility to false, the node will no longer be active in the cluster and you will not be able to see any cluster nodes from it.

[-epsilon {true|false}] - Epsilon (privilege: advanced)

If specified as true for a node, this value designates the specified node as epsilon for this cluster. In a cluster, only one node can be designated as epsilon at any given time. A node can be designated as Epsilon to add weight to its voting in a cluster with an even number of nodes.

`[-skip-quorum-check-before-eligible [true]] - Skip Quorum Check Before Setting Node Eligible`
(privilege: advanced)

If this parameter is specified, quorum checks will be skipped prior to setting a node eligible. When setting a node to eligible, the operation will continue even if there is a possible data outage due to a quorum issue.

`[-skip-quorum-check-before-ineligible [true]] - Skip Quorum Check Before Setting Node Ineligible`
(privilege: advanced)

If this parameter is specified, quorum checks will be skipped prior to setting a node ineligible. When setting a node to ineligible, the operation will continue even if there is a possible data outage due to a quorum issue.

`[-is-diff-svcs {true|false}] - Differentiated Services`

If set to true this means that the specified node and its HA partner is part of differentiated services storage infrastructure. The default value for this setting is false.

Examples

The following example modifies the attributes of a node named node0. The node's owner is set to "IT" and its location to "Data Center 2."

```
cluster1::> system node modify -node node0 -owner "IT" -location "Data Center 2"
```

system node reboot

Reboot a node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node reboot` command restarts a node. You can supply a reason for the reboot, which is stored in the audit log. You can also keep partner nodes from performing storage takeover during the reboot and instruct the rebooted node to create a core dump.

Parameters

`-node {<nodename>|local}` - Node

Specifies the node that is to be restarted. The value "local" specifies the current node.

`[-inhibit-takeover | -f [true]] - Disallow Storage Takeover by Partner`

If set to true, this parameter specifies that the node's failover partner is not allowed to take over for the node when the node is rebooted. In a two-node MetroCluster configuration, this parameter prevents automatic unplanned switchover. If you enter this command without using this parameter, its effective value is false and storage takeover is allowed. If you enter this parameter without a value, it is automatically set to true and storage takeover is disabled during reboot.

`[-reason <text>] - Reason for Reboot`

Use this parameter to enter a brief note to indicate the reason for the restart, which will be stored in the audit log. Providing this information assists support personnel with troubleshooting efforts.

`[-dump | -d [true]] - Create a Core Dump`

If you would like the node to create a core dump before restarting, specify the true value with this parameter. If you enter this command without using this parameter, its effective value is false and the node doesn't create a core dump. If you enter this parameter without a value, it is automatically set to true and the node creates a core dump.

`[-skip-lif-migration-before-reboot [true]] - Skip Migrating LIFs Away from Node Prior to Reboot`

If this parameter is specified, LIF migration prior to the reboot will be skipped. However if LIFs on this node are configured for failover, those LIFs may still failover after the reboot has occurred. The default is to migrate LIFs prior to the reboot. In the default case, the command attempts to synchronously migrate data and cluster management LIFs away from the node prior to reboot. If the migration fails or times out, the reboot will be aborted.

`[-ignore-quorum-warnings [true]] - Skip Quorum Check Before Reboot`

If this parameter is specified, quorum checks will be skipped prior to the reboot. The operation will continue even if there is a possible data outage due to a quorum issue.

Examples

The command in the following example restarts the node named `cluster1` for a software upgrade:

```
cluster1::> system node reboot -node cluster1 -reason "software upgrade"
```

system node rename

Rename a node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node rename` command changes a node's name. Both the node to be modified and the new name of that node must be specified with the following parameters. This command is best executed from the node that is being renamed, using the `-node local` parameter.

Use the [“system node show” on page 1153](#) command to display the names of all the nodes in the current cluster.

Parameters

`-node {<nodename>|local}` - Node

This parameter specifies which node you are renaming. The value `local` specifies the current node.

`-newname <text>` - New Name

Use this parameter to specify the new name of the node.

- The name must contain only the following characters: A-Z, a-z, 0-9, "-" or "_".
- The first character must be one of the following characters: A-Z or a-z.
- The last character must be one of the following characters: A-Z, a-z or 0-9.
- The maximum supported length is 47 characters.
- The system reserves the following names: "all", "cluster", "local" and "localhost".

Examples

The following example changes the name of the node named `node3` to `node4`.

```
cluster1::> system node rename -node node3 -newname node4
```

system node restore-backup

Restore the original backup configuration to the HA target node

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system node restore-backup` command restores the backup configuration file that is stored on the partner node to the specified target node in an HA pair. The backup configuration file is restored after Data ONTAP has been installed on the target node.

The backup configuration file is stored on the HA partner node while the target node is down. After the target node has been installed, the partner node sends this backup configuration file to the target node through the management network by using the `system node restore-backup` command to restore the original configuration. This procedure is commonly used when replacing the target node's boot device.

The target IP address should be the address of the target node used for netboot installation.

Parameters

-node {<nodename>|local} - Node

Specifies the partner node that sends the backup configuration file to the target node. The value "local" specifies the current node.

-target-address <Remote InetAddress> - HA Partner IP Address

Specifies the IP address for the target node.

system node revert-to

Revert a node to a previous release of Data ONTAP

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system node revert-to` command reverts a node's cluster configuration to the given version. After the `system node revert-to` command has finished, the `revert_to` command must be run from the nodeshell. The `revert_to` command reverts the filesystem on individual nodes to the target release. Before running `revert -to` in the cluster shell, the target release must be installed on the node.

Parameters

-node {<nodename>|local} - Node

Specifies the node that is to be reverted. The value `local` specifies the current node.

-version <revert version> - Data ONTAP Version

Specifies the version of Data ONTAP to which the node is to be reverted.

[-check-only [true]] - Capability Check

If set to `true`, this parameter specifies that the cluster configuration revert should perform checks to verify all of the preconditions necessary for `revert-to` to complete successfully. Setting the parameter to `true` does not run through the actual revert process. By default this option is set to `false`.

Examples

The command in the following example reverts cluster configuration of a node named `node1` to Data ONTAP version 9.3

```
cluster1:::> system node revert-to -node node1 -version 9.3
```

system node run

Run interactive or non-interactive commands in the nodeshell

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Use the `system node run` command to run certain commands from the nodeshell CLI on a specific node in the cluster. You can run a single nodeshell command from the clustershell that returns immediately, or you can start an interactive nodeshell session from which you can run multiple nodeshell commands.

Nodeshell commands are useful for root volume management and system troubleshooting. Commands that are available through the nodeshell are scoped to a single node in the cluster. That is, they affect only the node specified by the value of the `-node` parameter and do not operate on other nodes in the cluster. To see a list of available nodeshell commands, type `'?'` at the interactive nodeshell prompt. For more information on the meanings and usage of the available commands, use the `man` command in the nodeshell.

Only one interactive nodeshell session at a time can be run on a single node. Up to 24 concurrent, non-interactive sessions can be run at a time on a node.

When running the nodeshell interactively, exit the nodeshell and return to the clustershell by using the `exit` command. If the nodeshell does not respond to commands, terminate the nodeshell process and return to the clustershell by pressing Ctrl-D.

The `system node run` command is not available from the GUI interface.

Note: An alternate way to invoke the `system node run` command is by typing the `run` as a single word.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the name of the node on which you want to run the nodeshell command. If you specify only this parameter, the command starts an interactive nodeshell session that lasts indefinitely. You can exit the nodeshell to the clustershell by pressing Ctrl-D or by typing the `exit` command.

{ [-command <text>, ...] - Command to Run

This optionally specifies the name of a single nodeshell command to run on the specified node. To see a list of available nodeshell commands, type `'?'` at an interactive nodeshell prompt.

| [-reset [true]] - Reset Existing Connection

If this parameter is specified with the `true` value, it terminates any existing interactive nodeshell session on the specified node. The default value is `false`.

Examples

The following example runs the nodeshell command `sysconfig -V` on a node named `node1`:

```
cluster1::> system node run -node node1 -command sysconfig -V
volume node1_aggr0 (1 RAID group):
  group 0: 3 disks
```

The following example starts a nodeshell session on a node named `node2` and then runs the nodeshell `sysconfig -V` command. The system remains in the nodeshell after running the `sysconfig -V` command.

```
cluster1::> run -node node2
Type 'exit' or 'Ctrl-D' to return to the CLI
node2> sysconfig -V
volume node2_aggr0 (1 RAID group):
  group 0: 3 disks
node2>
```

The following example starts a nodeshell session on a node named `node1` and then runs two nodeshell commands, `aggr status` first and `vol status` second. Use quotation marks and semicolons when executing multiple nodeshell commands with a single `run` command.

```
cluster1::> run -node node1 -command "aggr status; vol status"
      Aggr State      Status      Options
      aggr0 online    raid_dp, aggr  root
                        parity uninit'd!
                        32-bit
      aggr1 online    raid_dp, aggr
                        parity uninit'd!
                        32-bit
      Volume State    Status      Options
      vol0 online     raid_dp, flex  root, nvfail=on
                        parity uninit'd!
      root_vs0 online  raid_dp, flex  create_ucose=on,
                        cluster      convert_ucose=on,
                        parity uninit'd! maxdirsiz=102400
```

system node run-console

Access the console of a node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command allows you to access the console of any remote node on the same cluster. The remote access is helpful in situations where the node cannot be booted up or has network issues. This command establishes an SSH session with the Service Processor of a remote node and accesses that node's console over the serial channel. This command works even if Data ONTAP is not booted up on the remote node. You can get back to the original node by pressing Ctrl+D. This command works only on SSH sessions and not on physical console sessions.

Parameters

-node {<nodename>|local} - Node

This parameter specifies the node whose physical console you want to access.

Examples

The following example accesses the console of node2 in the same cluster.

```
cluster1::> system node run-console -node node2
Pressing Ctrl-D will end this session and any further sessions you might open on top of this session.
Type Ctrl-D.
SP-login: admin
Password:
*****
* This is an SP console session. Output from the      *
* serial console is also mirrored on this session.   *
*****
node2::>
node2::> Connection to 192.168.1.202 closed.

cluster1::>
```

system node show

Display the list of nodes in the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node show` command displays information about the nodes in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

To see a list of values that are in use for a particular field, use the `-fields` parameter of this command with the list of field names you wish to view. Use the [“system node modify” on page 1148](#) command to change some of the field values that this command displays.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-inventory]

Use this parameter to display inventory information such as serial numbers, asset tags, system identifiers, and model numbers.

| [-messages]

Use this parameter to display system messages for each node.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects information for node names that match this parameter value.

[-owner <text>] - Owner

Selects nodes that have owner values that match this parameter value.

[-location <text>] - Location

Selects nodes at specific physical locations that match this parameter value.

[-model <text>] - Model

Selects nodes that have model numbers that match this parameter value.

[-serialnumber <text>] - Serial Number

Selects nodes that have serial numbers that match this parameter value.

[-assettag <text>] - Asset Tag

Selects nodes that have asset tags that match this parameter value.

[-uptime {<seconds>|<d> days <hh>:<mm>[:<ss>]}] - Uptime

Selects nodes that have uptimes that match this parameter value. This parameter is most useful when used with a range indicator such as less than or greater than, as in:

```
show -uptime >"30 days 00:00"
```

[-nvramid <nvramid>] - NVRAM System ID

Selects nodes that have NVRAM system IDs that match this parameter value.

[-systemid <text>] - System ID

Selects nodes that have system IDs that match this parameter value.

[-vendor <text>] - Vendor

Selects nodes that have vendor names that match this parameter value.

[-health {true|false}] - Health

Selects nodes that have health values that match this parameter value. Specify `true` to display healthy nodes, and `false` to display unhealthy nodes.

[-eligibility {true|false}] - Eligibility

Selects nodes that have voting eligibility values that match this parameter value.

[-epsilon {true|false}] - Epsilon (privilege: advanced)

Selects nodes that have epsilon holding designations that match this parameter value. This is useful to find out which node, if any, in the current cluster has been designated as epsilon. Specify *true* to display the node holding epsilon, and *false* to display nodes not holding epsilon.

[-uuid <UUID>] - UUID (privilege: advanced)

Selects nodes that have the specified universal unique identifiers that match this parameter value.

[-is-diff-svcs {true|false}] - Differentiated Services

If *true*, the corresponding node is considered to be part of differentiated services storage infrastructure.

[-is-all-flash-optimized {true|false}] - All-Flash Optimized

Selects nodes that have "All-Flash Optimized" personality values that match this parameter value.

Specify *true* to display nodes which support only SSD drives, and *false* to display nodes which support all kinds of drives.

Examples

```
cluster1::> system node show
Node Health Eligibility Uptime Model Owner Location
-----
node0 true true 89 days 23:47 MODELXX IT Data Center 2
node1 true true 15 days 22:37 MODELXX Data Center 2
node2 true true 15 days 23:00 MODELXX Data Center 2
node3 true true 15 days 22:37 MODELXX Data Center 2
4 entries were displayed.
```

This example displays the locations and model numbers of all nodes that are in physical locations that have names beginning with "Lab":

```
cluster1::> system node show -location lab* -fields location, model
node location model
-----
node5 Lab 1 MODELXX
node7 Lab 3 MODELXX
node9 Lab 5 MODELXX
cluster1::> system node show
Node Health Eligibility Uptime Model Owner Location
-----
node0 true true 89 days 23:47 MODELXX IT Data Center 2
node1 true true 15 days 22:37 MODELXX Data Center 2
node2 true true 15 days 23:00 MODELXX Data Center 2
node3 true true 15 days 22:37 MODELXX Data Center 2
4 entries were displayed.
```

This example displays the locations and model numbers of all nodes that are in physical locations that have names beginning with "Lab":

```
cluster1::> system node show -location lab* -fields location, model
node location model
-----
node5 Lab 1 MODELXX
node7 Lab 3 MODELXX
node9 Lab 5 MODELXX
```

system node show-discovered

Display all nodes discovered on the local network

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node show-discovered` command displays information about all the detectable nodes on the local cluster network. This includes both nodes in a cluster and nodes that do not belong to a cluster. You can filter the output to show only nodes that do not belong to a cluster or nodes that are in a cluster.

To see a list of values that are in use for a particular field, use the `-fields` parameter of this command with the list of field names you wish to view.

Parameters

[`-fields <fieldname>, ...`]

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

[`-instance`]

If the `-instance` parameter is specified, the command displays detailed information about each node.

[`-node <text>`] - Node Name

This parameter specifies the name of a node for which information is to be displayed. If this parameter is not specified, the command displays information about all discovered nodes.

[`-is-in-cluster {true|false}`] - Is in a Cluster

If this parameter is set to `false`, the command lists only nodes that do not belong to a cluster.

[`-cluster-uuid <UUID>`] - Cluster UUID

Displays information about nodes belonging to the cluster that has the UUID you specify.

[`-cluster-name <text>`] - Cluster Name

Displays information about nodes belonging to the cluster that has the name you specify.

[`-serial-number <text>`] - Node Serial Number

Displays information about the node that has the serial number you specify.

[`-addresses <IP Address>, ...`] - Cluster IP Addresses

Displays information about the node that has the cluster IP addresses you specify.

[`-netmask <IP Address>`] - Cluster Address Mask

Displays information about the nodes that have the netmask address you specify.

[`-nvramid <nvramid>`] - Node NVRAM ID

Displays information about the node that has the NVRAM ID you specify.

[`-partner-nvramid <nvramid>`] - Partner NVRAM ID

Displays information about the node that has an HA partner with the NVRAM ID you specify.

[`-model <text>`] - Model

Displays the nodes that have the specified model number.

[`-version <text>`] - Software Version

Displays the nodes that have the specified version of Data ONTAP.

Examples

The following example displays information about all discovered nodes in the cluster network:

```
cluster1::> system node show-discovered
```

Node	Cluster	Addresses	NVRAM ID	Partner NVRAM
4069114-60-0	-	169.254.232.178	4069114600	-
4069114-60-2	-	169.254.79.38	4069114602	-
4069114-60-3	-	169.254.195.76	4069114603	-
cluster1-01	cluster1	169.254.140.39	4069114628	4069114629
cluster1-02	cluster1	169.254.138.137	4069114629	4069114628

system node show-memory-errors

Display Memory Errors on DIMMs

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

`system node show-memory-errors` prints the history of memory (storage controller's RAM) errors since boot. This command can be useful in diagnosing memory problems or determining which DIMM, if any, might need replacement. Some correctable ECC errors are to be expected under normal operation, but many occurring on a particular DIMM might indicate a problem. All the fields are read only and can be used to filter the output. The maximum number of physical address and timestamps reported is 160.

Parameters

[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-verbose]

The `-verbose` parameter enables verbose mode, resulting in the display of more detailed output.

[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

When provided, the `-node` parameter specifies the nodes for which the memory error statistics are to be displayed. When the `-node` is not provided, the command is applied to all the nodes in the cluster.

[-id <integer>] - DIMM ID

This parameter refers to the DIMM ID. It can be used to look at the correctable ECC error count on a specific DIMM.

[-name <text>] - DIMM Name

This parameter specifies the DIMM name for which the memory error statistics are to be displayed.

[-cecc <integer>] - Correctable ECC Error Count

This parameter can be used to get all the DIMMs with the specified correctable ECC error count.

[-merr {true|false}] - Multiple Errors on Same Address

Use this parameter with the values `true` to specify whether the error was seen multiple times on the same physical address. It can also be used to look at all the DIMMs with multiple errors on same address.

[-timestamp <text>, ...] - Error Time

This specifies the time at which the error was seen on the DIMM.

[-addr <text>, ...] - Error Address

This specifies the physical address on which the error was seen.

Examples

```
cluster1::*> system node show-memory-errors
Correctable ECC Memory Errors:
```

```
Node: localhost
```

DIMM Name	CECC Count	Multiple Err Same Address
DIMM-1	0	false
DIMM-2	0	false
DIMM-3	0	false
DIMM-4	0	false
DIMM-5	4	true
DIMM-6	1	false
DIMM-7	1	false
DIMM-8	0	false

8 entries were displayed.

```
cluster1::*> system node show-memory-errors -verbose
Correctable ECC Memory Errors:
```

Node: localhost

DIMM Name	CECC Count	Multiple Err Same	Address	Timestamp	Physical Address
DIMM-1	0	false		-	-
DIMM-2	0	false		-	-
DIMM-3	0	false		-	-
DIMM-4	0	false		-	-
DIMM-5	4	true		12/02/2013 08:17:43	0xD640
				12/02/2013 08:17:57	0x3F7FF800
				12/02/2013 08:18:03	0x11743D000
				12/02/2013 08:18:37	0x11743D000
DIMM-6	1	false		12/02/2013 08:17:53	0x87EC0
DIMM-7	1	false		12/02/2013 08:17:51	0x13DED8900
DIMM-8	0	false		-	-

8 entries were displayed.

system node autosupport commands

Manage AutoSupport service

system node autosupport invoke

Generate and send an AutoSupport message

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node autosupport invoke` command sends an AutoSupport message from a node.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the node from which the AutoSupport message is sent.

[-message <text>] - Message Included in the AutoSupport Subject

Use this parameter to specify text sent in the subject line of the AutoSupport message. This parameter is not available when the `-type` parameter is set to `performance`.

-type {test|performance|all} - Type of AutoSupport Collection to Issue

Use this parameter to specify the type of AutoSupport collection to issue. There is no default; you must specify a `-type`.

- `test` - The message contains basic information about the node. When the AutoSupport message is received by technical support, an e-mail confirmation is sent to the system owner of record. This enables you to confirm that the message is being received by technical support.
- `all` - The message contains all collected information about the node.
- `performance` - The message contains only performance information about the node. This parameter has effect only if performance AutoSupport messages are enabled, which is controlled by the `-perf` parameter of the [“system node autosupport modify” on page 1161](#) command.

[-uri <text>] - Alternate Destination for This AutoSupport

Use this parameter to send the AutoSupport message to the destination you specify instead of the configured destination. Only `file`, `mailto`, `http`, and `https` protocols are supported. If this parameter is omitted, the message is sent to the all of the recipients defined by the [“system node autosupport modify” on page 1161](#) command.

[-force [true]] - Generate and Send Even if Disabled

Use this parameter to generate and send the message even if AutoSupport is disabled on the node.

Examples

The following example sends a test AutoSupport message from a node named node0 with the text "Testing ASUP":

```
cluster1::> system node autosupport invoke -node node0 -type test -message "Testing ASUP"
```

system node autosupport invoke-core-upload

Generate and send an AutoSupport message with an existing core file.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node autosupport invoke-core-upload` command sends two AutoSupport messages. The first AutoSupport message contains the content relevant to this core upload. This AutoSupport message has subject line with prefix "CORE INFO:". The second Autosupport message contains the core file specified by the "-core-filename" option. This AutoSupport message has subject line with prefix "CORE UPLOAD:". The command requires that the specified file be present while the AutoSupport message is being transmitted.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the node from which the AutoSupport message is sent. Defaults to localhost.

[-message <text>] - Message Included in the AutoSupport Subject

Use this parameter to specify the text in the subject line of the AutoSupport message.

[-uri <text>] - Alternate Destination for This AutoSupport

Use this parameter to send the AutoSupport message to an alternate destination. Only "http" and "https" protocols are supported. If this parameter is omitted, the message is sent to all the recipients defined by the ["system node autosupport modify" on page 1161](#) command.

[-force [true]] - Generate and Send Even if Disabled

Use this parameter to generate and send the AutoSupport message even if AutoSupport is disabled on the node.

[-case-number <text>] - Case Number for This Core Upload

Use this parameter to specify the optional case number to be associated with this AutoSupport message.

-core-filename <text> - The Existing Core Filename to Upload

Use this parameter to specify the core file to be included in the AutoSupport message. Use the ["system node coredump show" on page 1182](#) command to list the core files by name.

Examples

Use this command to list the core files from a node:

```
cluster1::> system node coredump show -node local
Node:Type Core Name                               Saved Panic Time
-----
node:kernel
      core.4073000068.2013-09-11.15_05_01.nz      true  9/11/2013 15:05:01
```

Use this command to invoke an AutoSupport message with the corefile core.4073000068.2013-09-11.15_05_01.nz:

```
cluster1::> system node autosupport invoke-core-upload -core-filename core.4073000068.2013-09-11.15_05_01.nz -node local
```

system node autosupport invoke-performance-archive

Generate and send an AutoSupport message with performance archives.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node autosupport invoke-performance-archive` command sends an AutoSupport message with the performance archives from a node. The command requires that the performance archives in the specified date range be present while the AutoSupport message is being transmitted.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the node from which the AutoSupport message is sent. The default setting is localhost.

[-message <text>] - Message Included in the AutoSupport Subject

Use this parameter to specify the text in the subject line of the AutoSupport message.

[-uri <text>] - Alternate Destination for This AutoSupport

Use this parameter to send the AutoSupport message to an alternate destination. Only "file," "http," and "https" protocols are supported. If this parameter is omitted, the message is sent to the all of the recipients defined by the `system node autosupport modify` command.

[-force [true]] - Generate and Send Even if Disabled

Use this parameter to generate and send the AutoSupport message even if AutoSupport is disabled on the node.

[-case-number <text>] - Case Number for This Performance Archive Upload

Use this parameter to specify the optional case number to be associated with this AutoSupport message.

-start-date <MM/DD/YYYY HH:MM:SS> - Start Date for Performance Archive Dataset

Use this parameter to specify the start date for the files in the performance archive dataset to be included in the AutoSupport message.

{ -end-date <MM/DD/YYYY HH:MM:SS> - End Date for Performance Archive Dataset

Use this parameter to specify the end date for the files in the performance archive dataset to be included in the AutoSupport message. The end date should be within six hours of the start date.

| -duration <[<integer>h][<integer>m][<integer>s]> - Duration of Performance Archive Dataset

Use this parameter with start-date to specify the duration of the performance archive dataset to be included in the AutoSupport message. The maximum duration limit is six hours from the start date.

Examples

Use this command to invoke an AutoSupport message to include the performance archives in the given date range:

```
cluster1::> system node autosupport invoke-performance-archive -node local -start-date 9/12/2013 19:37:24 -end-date 9/12/2013 22:37:24
cluster1::> system node autosupport invoke-performance-archive -node local -start-date 11/21/2013 13:42:09 -duration 6h
```

system node autosupport invoke-splog

Generate and send an AutoSupport message with collected service-processor log files

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node autosupport invoke-splog` command sends an AutoSupport message with the Service Processor log files from a specified node in the cluster.

Parameters

-remote-node {<nodename>|local} - Node

Use this parameter to specify the node from which Service Processor log files are to be collected.

[-log-sequence <integer>] - Log File Sequence Number

Use this parameter to specify the sequence number of the Service Processor log files to be collected. If this parameter is omitted, the latest Service Processor log files are collected.

[-uri <text>] - Alternate Destination for This AutoSupport

Use this parameter to send the AutoSupport message to an alternate destination. Only "file," "http," and "https" protocols are supported. If this parameter is omitted, the message is sent to all of the recipients defined by the ["system node autosupport modify" on page 1161](#) command.

[-force [true]] - Generate and Send Even if Disabled

Use this parameter to generate and send the AutoSupport message even if AutoSupport is disabled on the node.

Examples

Use this command to invoke an AutoSupport message to include the Service Processor log files collected from node cluster1-02.

```
cluster1::> system node autosupport invoke-splog -remote-node cluster1-02
[Job 777] Job succeeded: Log files from the service processor have been
transferred to "/mroot/etc/log/sp/ondemand" on node cluster1-01, and
AutoSupport message has been triggered.
```

```
cluster1::>
```

system node autosupport modify

Modify AutoSupport configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node autosupport modify` command modifies the AutoSupport configuration of a node.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the node being configured.

[-state {enable|disable}] - State

Use this parameter to specify whether AutoSupport is enabled or disabled on the node. The default setting is *enable*. When AutoSupport is disabled, messages are not sent to anyone, including the vendor's technical support, your internal support organization, or partners.

[-mail-hosts <text>, ...] - SMTP Mail Hosts

Use this parameter to specify up to five SMTP mail hosts through which the node sends AutoSupport messages. This parameter is required if you specify e-mail addresses in the *-to*, *-noteto*, or *-partner-address* parameters or if you specify *smtp* in the *-transport* parameter. Separate multiple mail hosts with commas with no spaces in between. The AutoSupport delivery engine attempts to use these hosts for delivery in the order that you specify.

You can optionally specify a port value for each mail server. A port value can be specified on none, all, or some of the mail hosts. The port specification for a mail host consists of a colon (":") and a decimal value between 1 and 65335, and follows the mailhost name (for example, *mymailhost.example.com:5678*). The default port value is 25.

Also, you can optionally prepend a user name and password combination for authentication to each mail server. The format of the username and password pair is *user1:pw1@mymailhost.example.com*. The username and password can be specified on none, all, or some of the mail hosts.

The default value for this parameter is *mailhost*.

[-from <mail address>] - From Address

Use this parameter to specify the e-mail address from which the node sends AutoSupport messages. The default is Postmaster@xxx where xxx is the name of the system.

[-to <mail address>, ...] - List of To Addresses

Use this parameter to specify up to five e-mail addresses to receive AutoSupport messages that are most relevant for your internal organization. Separate multiple addresses with commas with no spaces in between. For this parameter to have effect, the -mail-hosts parameter must be configured correctly. Individual trigger events can change the default usage of this parameter using the -to parameter of the [“system node autosupport trigger modify” on page 1178](#) command. By default, no list is defined.

[-noteto <mail address>, ...] - (DEPRECATED) List of Noteto Addresses

Note: This parameter has been deprecated and might be removed in a future version of Data ONTAP.

Use this parameter to specify up to five addresses to receive a short-note version of AutoSupport messages that are most relevant for your internal organization. Short-note e-mails contain only the subject line of the AutoSupport message, which is easier to view on a mobile device. For this parameter to have effect, the -mail-hosts parameter must be configured correctly. Individual trigger events can change the default usage of this parameter using the -noteto parameter of the [“system node autosupport trigger modify” on page 1178](#) command. By default, no list is defined.

[-partner-address <mail address>, ...] - List of Partner Addresses

Use this parameter to specify up to five e-mail addresses to receive all AutoSupport messages including periodic messages. This parameter is typically used for support partners. For this parameter to have effect, the -mail-hosts parameter must be configured correctly. By default, no list is defined.

[-support {enable|disable}] - Send AutoSupport Messages to Vendor Support

Use this parameter to specify whether to send all AutoSupport messages to your vendor's technical support. (Destination information is pre-defined and does not require configuration.) When -state is enabled and -support is disabled, messages are sent to the addresses specified in the -to, -noteto, or -partner-address parameters but are not sent to your vendor's technical support. The default is enable.

[-transport {smtp|http|https}] - Protocol to Contact Support

Use this parameter to specify the protocol used to deliver AutoSupport messages to your vendor's technical support. This parameter applies only when the -support parameter is set to enable. If you specify http or https and your network uses a proxy, you must also set the -proxy-url parameter. If you specify smtp, you must also configure the -mail-hosts parameter.

[-proxy-url <text>] - Support Proxy URL

Use this parameter to specify an HTTP or HTTPS proxy if the -transport parameter is set to HTTP or HTTPS and your organization uses a proxy. Enter the URL without an http:// or https:// prefix. If authentication is required, use the format "[username]@[host][:[port]]". You will be prompted for the password. The default is an empty string. To specify a proxy that contains a question mark, press ESC followed by the "?". This field can be cleared by setting the value to an empty string using two double quotes ("").

[-hostname-subj {true|false}] - Hostname Subject

Use this parameter to specify whether the hostname of the node is included in the subject line of the AutoSupport message. The default is false. This parameter applies only if the -remove-private-data parameter is true.

[-nht {true|false}] - NHT Enable

Use this parameter to specify whether NHT disk drive health data is sent to technical support and addresses specified in the -partner-address parameter when disk drives fail. The default is true.

[-perf {true|false}] - Performance Data Enable

Use this parameter to specify whether performance data is sent to technical support and addresses specified in the -partner-address parameter. The default is true.

[-retry-interval <[<integer>h][<integer>m][<integer>s]>] - Retry Interval

Use this parameter to specify the amount of time to delay before trying to send an AutoSupport message again after a sending failure. Values may end with "s", "m", or "h" to indicate seconds, minutes, or hours, respectively. The minimum interval is 30 seconds and the maximum is 1 day. The default is 4 minutes.

[-retry-count <integer>] - Retry Count

Use this parameter to specify the number of times to try resending mail before dropping it. The minimum number is 5 and the maximum is 30. The default is 15 times.

[-reminder {true|false}] - Reminder Enable

Use this parameter to enable or disable a reminder message that is sent when AutoSupport is not configured to send messages to technical support. This reminder is logged as an EMS event called "autosupport.general.reminder" every 24 hours. The default is `true`.

[-max-http-size <[integer>[KB|MB|GB|TB|PB]]] - Maximum HTTP Size

Use this parameter to specify the maximum file size (in bytes by default, but can also be specified in KB, MB, TB or PB) for HTTP and HTTPS transfers. This parameter applies only to messages sent to technical support and only if the `-transport` parameter is set to HTTP or HTTPS. Setting the value to 0 disables the delivery size budget. The default is 50 MB and the minimum supported size is 2 MB.

If the size of the AutoSupport message exceeds this value, AutoSupport will deliver as much of the message as possible. You can use the "system node autosupport manifest show" command to identify the sections of the message that AutoSupport sent. AutoSupport collects and sends the content in order of priority. The priority is predefined for each AutoSupport message. To identify the collection order for an AutoSupport trigger, use the "system node autosupport trigger show" command with the `-instance` parameter.

[-max-smtp-size <[integer>[KB|MB|GB|TB|PB]]] - Maximum SMTP Size

Use this parameter to specify the maximum file size (in bytes by default, but can also be specified in KB, MB, TB or PB) for SMTP (e-mail) transfers. This parameter applies to messages sent to the addresses specified in the `-to`, `-noteto`, and `-partner-address` parameters. If the `-transport` parameter is set to `smtp`, this parameter also applies to messages sent to the vendor's technical support. Setting the value to 0 disables the delivery size budget. The default is 5 MB and the minimum supported size is 2 MB.

If the size of the AutoSupport message exceeds this value, AutoSupport will deliver as much of the message as possible. You can use the "system node autosupport manifest show" command to identify the sections of the message that AutoSupport sent. AutoSupport collects and sends the content in order of priority. The priority is predefined for each AutoSupport message. To identify the collection order for an AutoSupport trigger, use the "system node autosupport trigger show" command with the `-instance` parameter.

[-remove-private-data {true|false}] - Remove Sensitive Data

Use this parameter with the value `true` to remove, encode, or mask sensitive data from AutoSupport attachments and headers. Use this feature to eliminate private data from all AutoSupport messages.

Eliminated data might include: IP addresses, MAC addresses, URIs, DNS names, e-mail addresses, port numbers, node names, Vserver names, cluster names, aggregate names, volume names, junction paths, policy names, user IDs, group IDs, LUNs, NVMe namespaces and qtree names.

The default is `false`.

Note: Changing this value from `false` to `true` deletes the AutoSupport history and all files associated with it.

[-validate-digital-certificate {true|false}] - Validate Digital Certificate Received

Use this parameter with the value `true` to force the node to validate digital certificates that it receives. The default is `true`. When this value is `true` the certificate might be validated by OCSP. The OCSP

validation for these certificates is controlled by `security config ocsf enable -app autosupport` and `security config ocsf disable -app autosupport`.

`[-ondemand-state {enable|disable}] - AutoSupport OnDemand State (privilege: advanced)`

Use this parameter to specify whether the AutoSupport OnDemand feature is enabled or disabled on the node. The default is `enable`. When AutoSupport OnDemand is enabled, support personnel can remotely trigger new AutoSupport messages, re-send existing AutoSupport messages and decline the delivery of unwanted AutoSupport messages. When this option is disabled, this node will not respond to any AutoSupport OnDemand requests from support personnel.

`[-ondemand-remote-diagnostics-state {enable|disable}] - AutoSupport OnDemand Remote Diagnostics State (privilege: advanced)`

Use this parameter to specify whether the AutoSupport OnDemand Remote Diagnostics feature is enabled or disabled on the node. The default is `enable`. When AutoSupport OnDemand Remote Diagnostics is enabled, support personnel can remotely trigger new AutoSupport messages on this node to gather information during troubleshooting scenarios. When this option is disabled, support personnel will still be able to re-send existing AutoSupport messages that may not have been transmitted correctly.

Examples

The following example enables AutoSupport on a node named `node3` with the following settings:

- SMTP mail host named `smtp.example.com`.
- E-mail "from" address of `alerts@node3.example.com`
- E-mail "to" address of `support@example.com`
- AutoSupport messages sent to support personnel
- HTTPS set as transport protocol
- Short-note address of `pda@example.com`
- If sending fails, the system will wait 23 minutes before retrying.

```
cluster1::> system node autosupport modify -node node3 -state enable -mail-hosts smtp.example.com -from alerts@node3.example.com -to support
```

The following examples show how to modify AutoSupport URLs when using IPv6 address literals:

```
cluster1::> system node autosupport modify -node node1 -mail-hosts [2620:10a:4002:6004::bbbb]:25
cluster1::> system node autosupport modify -node node1 -proxy-url username:password@[2620:10a:4002:6004::bbbb]:8080
```

system node autosupport show

Display AutoSupport configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node autosupport show` command displays the AutoSupport configuration of one or more nodes.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[-config]`

Use this parameter to display the retry interval, retry count, throttle, and reminder settings of all nodes in the cluster.

| [-nht-performance]

Use this parameter to display NHT and performance information about all nodes in the cluster.

| [-recent]

Use this parameter to display the subject and time of the last AutoSupport message generated by each node in the cluster.

| [-support-http]

Use this parameter to display whether HTTP support is enabled for each node in the cluster, and identify the transport protocol and the support proxy URL used by each node.

| [-support-smtp]

Use this parameter to display whether SMTP (e-mail) support is enabled for each node in the cluster, and identify the transport protocol and the "to" mail address used by each node.

| [-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Use this parameter to display detailed information about the node you specify.

[-state {enable|disable}] - State

Use this parameter to display information only about nodes that have the AutoSupport state you specify.

[-mail-hosts <text>, ...] - SMTP Mail Hosts

Use this parameter to display information only about nodes that use the mail hosts you specify.

[-from <mail address>] - From Address

Use this parameter to display information only about nodes that have the "from" e-mail address you specify.

[-to <mail address>, ...] - List of To Addresses

Use this parameter to display information only about nodes that have the "to" e-mail addresses you specify.

[-noteto <mail address>, ...] - (DEPRECATED) List of Noteto Addresses

Note: This parameter has been deprecated and might be removed in a future version of Data ONTAP.

Use this parameter to display information only about nodes that send short-note e-mail messages to the e-mail addresses you specify. Short-note e-mails contain only the subject line of the AutoSupport message, which is easier to view on a mobile device.

[-partner-address <mail address>, ...] - List of Partner Addresses

Use this parameter to display information only about nodes that have the "partner-address" e-mail addresses you specify. These addresses are not subject to the delivery limitations configured for the "-to" addresses of AutoSupport triggers.

[-support {enable|disable}] - Send AutoSupport Messages to Vendor Support

Use this parameter with the value "enable" to display information only about nodes that send AutoSupport messages to your vendor's technical support. Use this parameter with the value "disable" to display information only about nodes that do not send AutoSupport messages to your vendor's technical support.

[-transport {smtp|http|https}] - Protocol to Contact Support

Use this parameter to display information only about nodes that use the protocol you specify to send AutoSupport messages.

[-url <text>] - Support URL for HTTP/HTTPS

Use this parameter to display information only about nodes that use the URL you specify to send messages through HTTP and HTTPS POST operations.

[-put-url <text>] - Support URL for HTTP/S PUT

Use this parameter to display information only about nodes that use the URL you specify to send messages through HTTP PUT operations.

[-proxy-url <text>] - Support Proxy URL

Use this parameter to display information only about nodes that use the proxy URL you specify.

[-support-address <mail address>, ...] - Support Address

Use this parameter to display information only about nodes that use the external support address you specify.

[-hostname-subj {true|false}] - Hostname Subject

Use this parameter to display information only about nodes that include their hostname in the "Subject:" line of AutoSupport messages. If the parameter "remove-private-data" is false, this parameter has no effect.

[-nht {true|false}] - NHT Enable

Use this parameter with the value "true" to display information only about nodes that send NHT disk drive data. Use this parameter with the value "false" to display information only about nodes that do not send NHT data.

[-perf {true|false}] - Performance Data Enable

Use this parameter with the value "true" to display information only about nodes that send periodic performance AutoSupport messages. Use this parameter with the value "false" to display information only about nodes that do not send periodic performance messages.

[-retry-interval <[<integer>h][<integer>m][<integer>s]>] - Retry Interval

Use this parameter to display information only about nodes that use the retry interval you specify.

[-retry-count <integer>] - Retry Count

Use this parameter to display information only about nodes that use the retry count you specify.

[-reminder {true|false}] - Reminder Enable

Use this parameter with the value "true" to display information only about nodes that send messages reminding administrators to enable AutoSupport if AutoSupport is not enabled. Use this parameter with the value "false" to display information only about nodes that do not send reminder messages.

[-last-subject <text>] - Last Subject Sent

Use this parameter to display information only about nodes whose last AutoSupport message had the "Subject:" line you specify.

[-last-time <MM/DD/YYYY HH:MM:SS>] - Last Time Sent

Use this parameter to display information only about nodes whose last AutoSupport message was sent at the date and time you specify. Specify the date and time in the format "MM/DD/YYYY HH:MM:SS".

[-max-http-size {<integer>[KB|MB|GB|TB|PB]] - Maximum HTTP Size

Use this parameter to display information only about nodes that limit the maximum size of HTTP transfers to the file size you specify.

[-max-smtp-size {<integer>[KB|MB|GB|TB|PB]] - Maximum SMTP Size

Use this parameter to display information only about nodes that limit the maximum size of SMTP (e-mail) transfers to the file size you specify.

[-remove-private-data {true|false}] - Remove Sensitive Data

Use this parameter with the value "true" to display information only about nodes that remove sensitive data from AutoSupport messages. Use this parameter with the value "false" to display information only about nodes that do not remove sensitive data.

[-validate-digital-certificate {true|false}] - Validate Digital Certificate Received

Use this parameter with the value "true" to display information only about nodes that validate digital certificates they receive. Use this parameter with the value "false" to display information only about nodes that do not validate digital certificates.

[-ondemand-state {enable|disable}] - AutoSupport OnDemand State (privilege: advanced)

Use this parameter to display information only about nodes that have the AutoSupport OnDemand state you specify.

[-ondemand-remote-diagnostics-state {enable|disable}] - AutoSupport OnDemand Remote Diagnostics State (privilege: advanced)

Use this parameter to display information only about nodes that have the AutoSupport OnDemand Remote Diagnostics state you specify.

[-ondemand-server-url <text>] - AutoSupport OnDemand Server URL

Use this parameter to display information only about nodes that have the AutoSupport OnDemand Server URL you specify.

Examples

The following example displays the AutoSupport configuration for a node named node3:

```
cluster1::> system node autosupport show -node node3
Node: node3
State: enable
SMTP Mail Hosts: smtp.example.com
From Address: alerts@node3.example.com
List of To Addresses: support@example.com
List of Noteto Addresses: -
List of Partner Addresses: partner@node4.example.com
Send AutoSupport Messages to Vendor Support: enable
Protocol to Contact Support: https
Support Proxy URL: support.proxy.example.com
Hostname Subject: true
NHT Enable: true
Performance Data Enable: true
Retry Interval: 4m
Retry Count: 15
Reminder Enable: true
The Transmission Window: 1h
Last Subject Sent: WEEKLY
Last Time Sent: 3/11/2011 06:00:03
Maximum HTTP Size: 50MB
Maximum SMTP Size: 5MB
Remove Sensitive Data: false
Validate Digital Certificate Received: true
Continue Local Collection while Disabled: true
```

system node autosupport check commands

Check AutoSupport connectivity and configuration

system node autosupport check show

Display overall status of AutoSupport subsystem

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node autosupport status check show` command displays the overall status of the AutoSupport subsystem.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node

Selects the nodes that match this parameter value. This parameter specifies the node whose status is being displayed.

[-http-status {ok|warning|failed|not-run}] - Overall Status of AutoSupport HTTP/HTTPS Destinations

Selects the nodes that match this parameter value. This parameter specifies whether connectivity to the AutoSupport HTTP destination was established.

[-aod-status {ok|warning|failed|not-run}] - Overall Status of AutoSupport OnDemand Server

Selects the nodes that match this parameter value. This parameter specifies the detailed description of the connectivity status to the AutoSupport OnDemand Server.

[-smtp-status {ok|warning|failed|not-run}] - Overall Status of AutoSupport SMTP Destinations

Selects the nodes that match this parameter value. This parameter specifies whether connectivity to the AutoSupport mailhost was established.

[-config-status {ok|warning|failed|not-run}] - Overall Status of AutoSupport Configuration

Selects the nodes that match this parameter value. This parameter specifies whether the AutoSupport configuration check succeeded or not.

[-warning-text <text>] - Conditional Warning Message

Selects the nodes that match this parameter value. This parameter specifies how to get more details regarding the status of the AutoSupport subsystem, in case of any errors.

Examples

The following example displays the overall status of the AutoSupport subsystem on a node named node2:

```
cluster1::> system node autosupport check show -node node2
```

Node	On Demand			
	HTTP/HTTPS	Server	SMTP	Configuration
node2	ok	ok	ok	ok

system node autosupport check show-details

Display detailed status of AutoSupport subsystem

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node autosupport check show-details` command displays the detailed status of the AutoSupport subsystem. This includes verifying connectivity to your vendor's AutoSupport destinations by sending test messages and providing a list of possible errors in your AutoSupport configuration settings.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node

Selects the check results that match this parameter value. This parameter specifies the node whose status is being displayed.

[-check-type <Type of AutoSupport Check>] - AutoSupport Check Type

Selects the check results that match this parameter value. This parameter specifies the type of AutoSupport check being performed.

[-status {ok|warning|failed|not-run}] - Status of the Check

Selects the check results that match this parameter value. This parameter specifies the result of this AutoSupport check.

[-error-detail <text>] - Detailed Description of Error

Selects the check results that match this parameter value. This parameter specifies the detailed error message for this AutoSupport check.

[-corrective-action <text>] - Corrective Action

Selects the check results that match this parameter value. This parameter specifies a description of how to correct any errors seen as part of this AutoSupport Check

Examples

The following example displays the detailed status of the AutoSupport subsystem for a node named node2:

```
cluster1::> system node autosupport check show-details -node node2
Node: node2
```

```
Category: http-https
  Component: http-put-destination
    Status: ok
    Detail: Successfully connected to "support.netapp.com/put".

  Component: http-post-destination
    Status: ok
    Detail: Successfully connected to "support.netapp.com/post".

Category: smtp
  Component: mail-server
    Status: ok
    Detail: Successfully connected to "mailhost.netapp.com".

  Component: mail-server
    Status: ok
    Detail: Successfully connected to "sendmail.domain.com".

  Component: mail-server
    Status: ok
    Detail: Successfully connected to "qmail.domain.com".

Category: on-demand
  Component: ondemand-server
    Status: ok
    Detail: Successfully connected to "support.netapp.com/aods".

Category: configuration
  Component: configuration
    Status: ok
    Detail: No configuration issues found.
```

system node autosupport destinations commands

The AutoSupport Destinations directory

system node autosupport destinations show

Display a summary of the current AutoSupport destinations

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node autosupport destinations show` command displays a list of all message destinations used by AutoSupport. The command provides you with a quick summary of all addresses and URLs that receive AutoSupport messages from all nodes in the cluster.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node`

Use this parameter to display only destinations that receive AutoSupport messages from the node you specify.

`[-destinations <text>, ...] - Destinations`

Use this parameter to display only destination lists for nodes that send AutoSupport messages to the destinations you specify.

Examples

This example displays all of the destinations in use by the current cluster. Each node uses the same destination for HTTP POST, HTTP PUT, and e-mail notifications.

```
cluster1::> system node autosupport destinations show
```

```
Node
-----
Destinations
-----
node1
https://asuppost.example.com/cgi-bin/asup.cgi
https://asupput.example.com/cgi-bin/asup.cgi
support@example.com

node2
https://asuppost.example.com/cgi-bin/asup.cgi
https://asupput.example.com/cgi-bin/asup.cgi
support@example.com
```

system node autosupport history commands

The AutoSupport History Directory

system node autosupport history cancel

Cancel an AutoSupport Transmission.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node autosupport history cancel` command cancels an active AutoSupport transmission. This command is used to pause or abandon a long running delivery of an AutoSupport message. The cancelled AutoSupport message remains available for retransmission using the [“system node autosupport history retransmit” on page 1171](#) command.

Parameters

`-node {<nodename>|local}` - Node

Use this parameter to specify the node on which to cancel the AutoSupport message. The default setting is localhost.

`-seq-num <Sequence Number>` - AutoSupport Sequence Number

Use this parameter to specify the sequence number of the AutoSupport message you want to cancel.

`[-destination {smtp|http|noteto|retransmit}] - Destination for This AutoSupport`

Use this parameter to specify the destination type for the AutoSupport message you want to cancel.

Examples

Use this command to cancel the AutoSupport message delivery with seq-num 10 to all destinations.

```
cluster1::> system node autosupport history cancel -node local -seq-num 10
```

Use this command to cancel the AutoSupport message delivery with seq-num 10 via HTTP only.

```
cluster1::> system node autosupport history cancel -node local -seq-num 10 -destination http
```

system node autosupport history retransmit

Selectively retransmit a previously collected AutoSupport.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node autosupport history retransmit` command retransmits a locally stored AutoSupport message.

Support personnel might ask you to run this command to retransmit an AutoSupport message. You might also retransmit an AutoSupport message if you run the “[system node autosupport history show](#)” on [page 1171](#) command and notice that a message was not delivered.

If you retransmit an AutoSupport message, and if support already received that message, the support system will not create a duplicate case. If, on the other hand, support did not receive that message, then the AutoSupport system will analyze the message and create a case, if necessary.

Use the “[system node autosupport history show](#)” on [page 1171](#) command to display the 50 most recent AutoSupport messages, which are available for retransmission.

Parameters

-node <nodename>/local - Node

Use this parameter to specify the node from which the AutoSupport message is sent.

-seq-num <Sequence Number> - AutoSupport Sequence Number

Use this parameter to specify the sequence number of the AutoSupport message to retransmit.

-uri <text> - Destination to Send this AutoSupport

Use this parameter to specify the HTTP, HTTPS, FILE, or MAILTO uniform resource indicator (URI) to which the AutoSupport message is sent.

[-size-limit <integer>[KB|MB|GB|TB|PB]] - Transmit Size Limit for this AutoSupport.

Use this parameter to specify a size limit for the retransmitted AutoSupport message. If the message information exceeds this limit, it will be trimmed to fit the limit you specify. Omit the size limit or set it to 0 to disable it, which is useful to retransmit an AutoSupport message that was truncated by a mail or Web server due to the default size limits.

Examples

The following example retransmits the AutoSupport message with sequence number 45 on the node "node1" to a support address by e-mail.

```
cluster1::> system node autosupport history retransmit -node node1 -seq-num 45 -uri mailto:support@example.com
```

system node autosupport history show

Display recent AutoSupport messages

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node autosupport history show` command displays information about the 50 most recent AutoSupport messages sent by nodes in the cluster. By default, it displays the following information:

- AutoSupport sequence number
- Destination type, such as smtp
- Status of delivery, such as sent-successful
- Attempt count

- Time of last update

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-delivery]

Use this parameter to display destination information about each AutoSupport message.

| [-detail]

Use this parameter to display trigger and subject information about each AutoSupport message.

| [-instance]}

Use this parameter to display the following detailed information about all entries:

- Trigger event
- Subject of the message
- Delivery URI
- Last error
- Compressed Size
- Decompressed Size
- Total Collection Time (in ms)

[-node {<nodename>|local}] - Node

Use this parameter to display only AutoSupport messages sent from the node you specify.

[-seq-num <Sequence Number>] - AutoSupport Sequence Number

Use this parameter to display only AutoSupport messages with the sequence number you specify. Sequence numbers are unique to a node. Use this parameter with the -node parameter to display information about an individual message.

[-destination {smtp|http|noteto|retransmit}] - Destination for This AutoSupport

Use this parameter to display only AutoSupport messages that were sent to the destination type you specify.

[-trigger <Message Name>] - Trigger Event

Use this parameter to display only AutoSupport messages that match the trigger event you specify.

[-last-update <MM/DD/YYYY HH:MM:SS>] - Time of Last Update

Use this parameter to display only AutoSupport messages that were updated most recently at the time you specify. Specify time in "MM/DD/YYYY HH:MM:SS" format.

[-status <AutoSupport general status>] - Status of Delivery

Use this parameter to display only AutoSupport messages with the status you specify. Possible statuses are:

- initializing - The AutoSupport message request is being processed.
- collection-failed - The AutoSupport collection failed. View the 'Last Error' field of this message for more information.
- collection-in-progress - The AutoSupport collection is in progress.
- queued - The AutoSupport message is queued for delivery.
- transmitting - The AutoSupport message transmission is in progress.
- sent-successful - The AutoSupport message was sent successfully.
- ignore - The AutoSupport message was processed successfully, but the trigger event is not configured for delivery to the current destination type.

- re-queued - The AutoSupport message transmission failed, has been re-queued, and will be retried.
- transmission-failed - The AutoSupport message transmission failed, and the retry limit was exceeded.
- ondemand-ignore - The AutoSupport message was processed successfully, but the AutoSupport On Demand server chose to ignore it.

[-attempt-count <integer>] - Delivery Attempts

Use this parameter to display only AutoSupport messages that the system has attempted to send the number of times you specify. This parameter is most useful when given a range, such as ">5".

[-subject <text>] - AutoSupport Subject

Use this parameter to display only AutoSupport messages of the type you specify.

[-uri <text>] - Delivery URI

Use this parameter to display only AutoSupport messages sent to the destination URI you specify.

[-error <text>] - Last Error

Use this parameter to display only AutoSupport messages that failed with the "Last Error" description you specify.

[-generated-on <MM/DD/YYYY HH:MM:SS>] - Time of Generation

Use this parameter to display only AutoSupport messages that were generated (collected) at a particular time.

[-size {<integer>[KB|MB|GB|TB|PB]}] - AutoSupport Compressed Size

Use this parameter to display only AutoSupport messages of the compressed size you specify.

[-percent-complete <integer>] - Percent Complete

Use this parameter to display the percentage completed for any active (incomplete) AutoSupport message.

[-upload-rate {<integer>[Bps|KBps|MBps|GBps]|unlimited}] - Rate of Upload

Use this parameter to display the rate in bytes per second that upload is using currently, otherwise zero when not active.

[-time-remaining [<integer>h][<integer>m][<integer>s]>] - Time Remaining for Upload

Use this parameter to display the estimated time for the transmission of the AutoSupport message to complete.

[-decompressed-size {<integer>[KB|MB|GB|TB|PB]}] - AutoSupport Decompressed Size

Use this parameter to display only AutoSupport messages of the decompressed size you specify.

[-total-time <integer>] - Total Collection Time (ms)

Use this parameter to display only AutoSupport messages of total collection time you specify. A value is only shown when the collection has completed.

Examples

The following example shows the first three results output by the history command. Note that "q" was pressed at the prompt.

```
cluster1:: system node autosupport history show -node node1
```

Node	Seq Num	Destination	Status	Attempt Count	Last Update
node1	56	smtp	ignore	1	11/18/2010 01:10:01
		http	re-queued	2	11/18/2010 02:50:07
		noteto	transmitting	1	11/18/2010 01:10:01
	55	smtp	ignore	1	11/18/2010 00:53:59
		http	sent-successful	3	11/18/2010 01:50:03
		noteto	sent-successful	1	11/18/2010 00:53:59
	54	smtp	ignore	1	11/17/2010 12:18:58
		http	sent-successful	4	11/17/2010 16:07:22
		noteto	sent-successful	1	11/17/2010 12:18:58

Press [space] to page down, [return] for next line, or 'q' to quit... q

system node autosupport history show-upload-details

Display upload details of recent AutoSupport messages

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node autosupport history show-upload-details` command displays upload details of the 50 most recent AutoSupport messages sent by nodes in the cluster. By default, it displays the following information:

- AutoSupport Sequence Number
- Destination
- Compressed Size
- Percentage Complete
- Rate of upload
- Time Remaining

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

Use this parameter to display the following detailed information about all entries:

- AutoSupport Sequence Number
- Destination
- Compressed Size
- Percentage Complete
- Rate of Upload
- Time Remaining

[-node {<nodename>|local}] - Node

Use this parameter to display details of AutoSupport messages sent from the node you specify.

[-seq-num <Sequence Number>] - AutoSupport Sequence Number

Use this parameter to display details of AutoSupport messages with the sequence number you specify. Sequence numbers are unique to a node. Use this parameter with the `-node` parameter to display information about an individual message.

[-destination {smtp|http|noteto|retransmit}] - Destination for this AutoSupport

Use this parameter to display details of AutoSupport messages that were sent to the destination type you specify.

[-size {<integer>[KB|MB|GB|TB|PB]}] - Autosupport Compressed Size

Use this parameter to display details of AutoSupport messages of the compressed size you specify.

[-percent-complete <integer>] - Percent Complete

Use this parameter to display the percentage completed for any active (incomplete) AutoSupport message.

[-upload-rate {<integer>[Bps|KBps|MBps|GBps]|unlimited}] - Rate of Upload

Use this parameter to display the rate in bytes per second that upload is using currently, otherwise zero when not active.

[-time-remaining <[<integer>h][<integer>m][<integer>s]>] - Time remaining for Upload

Use this parameter to display the estimated time for the transmission of the AutoSupport message to complete.

Examples

The following example shows the first three results output by the history show-upload-details command.

Note that "q" was pressed at the prompt.

```
cluster1:: system node autosupport history show-upload-details -node node1
Node      Seq      Destination Size      Percent      Rate      Time
          Num                                     Complete
-----
node1
          13
            smtp      755.9KB      100      142.88KBps      0s
            http      755.8KB      80      125.97KBps      10s
            noteto      -      -      -      -
          12
            smtp      -      -      -      -
            http      316.4KB      100      158.22KBps      0s
            noteto      201B      100      201Bps      0s
          11
            smtp      -      -      -      -
            http      626.1MB      100      649.56KBps      0s
            noteto      -      -      -      -
```

Press [space] to page down, [return] for next line, or 'q' to quit... q

system node autosupport manifest commands

The AutoSupport Manifest directory

system node autosupport manifest show

Display AutoSupport content manifest

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node autosupport manifest show` command reports what information is contained in AutoSupport messages. The name and size of each file collected for the message is reported, along with any errors.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| **[-content]**

Use this parameter to display detailed information about the content of the files contained in the report.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Use this parameter to display information about only AutoSupport messages sent from the node you specify.

[-seq-num <Sequence Number>] - AutoSupport Sequence Number

Use this parameter to display information about only AutoSupport message content with the sequence number you specify. Sequence numbers are unique to a node. Use this parameter with the `-node` parameter to display information about an individual message.

[-prio-num <integer>] - Priority Order of Collection

Use this parameter to display information about only AutoSupport message content with the collection priority you specify. Content is collected in order, by priority number.

[-subsys <subsys1,subsys2,...>] - Subsystem

Use this parameter to display information about only AutoSupport message content collected by the AutoSupport subsystem you specify.

[-cmd-tgt <Execution domain of AutoSupport content>] - Execution Domain for Command

Use this parameter to display information about only AutoSupport message content produced in the execution domain you specify.

[-body-file <text>] - The AutoSupport Content Filename for this Data

Use this parameter to display information about only AutoSupport message content stored in the body file with the file name you specify.

[-cmd <text>] - Actual Data Being Collected

Use this parameter to display information about only AutoSupport message content produced by the D-Blade command, BSD command, file, or XML table you specify.

[-query <text>] - Table Query for XML Collection

Use this parameter to display information about only AutoSupport message content produced by the table query you specify.

[-size-collected {<integer>[KB|MB|GB|TB|PB]] - Number of Bytes Collected

Use this parameter to display information about only AutoSupport message content collected in files with the file size you specify.

[-time-collected <integer>] - Collection Time for this Data Item (ms)

Use this parameter to display information about only AutoSupport message content collected in the amount of time you specify, in milliseconds.

[-status <AutoSupport manifest collection status>] - Status of this Data Item

Use this parameter to display information about only AutoSupport message content with the collection status you specify. Possible statuses are:

- `requested` - The AutoSupport request has been added to the queue and is waiting processing by the collector.
- `working` - The AutoSupport collector is actively gathering the needed data.
- `file-not-found` - AutoSupport data collection failed because a necessary file is missing.
- `no-such-table` - The AutoSupport collector was unable to find the requested SMF table.
- `collection-truncated-size-limit` - AutoSupport data was truncated due to size limits, but partial data is available.
- `collection-truncated-file-size-limit` - AutoSupport data for a particular data item or file was truncated due to file size limits, but partial data is available.
- `collection-skipped-size-limit` - AutoSupport data was skipped due to size limits, and no data is available.
- `collection-truncated-time-limit` - AutoSupport data was truncated due to time limits, but partial data is available.
- `collection-skipped-time-limit` - AutoSupport data was skipped due to time limits, and no data is available.
- `delivery-skipped-size-limit` - AutoSupport data was skipped at delivery time due to size limits.

- **general-error** - AutoSupport data collection failed. Additional information (if any) is in the Error String field.
- **completed** - AutoSupport data collection is complete, and the AutoSupport message is ready for delivery.
- **content-not-collected-preccheck** - AutoSupport content was not collected due to pre-check function violation.
- **content-not-collected-privacy** - AutoSupport content was not collected because the operation is disabled in privacy mode.
- **content-empty** - AutoSupport content was collected successfully, but the output was empty.
- **collection-aborted** - AutoSupport data collection was aborted.

[-error <text>] - Textual Description of Error

Use this parameter to display information about only AutoSupport message content with the error text you specify. If data collection has failed, the error text contains a description of the failure. If data collection completes successfully, this field is empty.

[-content-type <Type of AutoSupport content>] - AutoSupport Content Type for this Data

Use this parameter to display information about only AutoSupport message content of the type you specify. Types supported are:

- **basic** - Configuration data about this subsystem
- **troubleshooting** - Detailed diagnostic data about this subsystem

[-orig-size-collected {<integer>[KB|MB|GB|TB|PB]}] - Initial Number of Bytes Collected

Use this parameter to display information about only AutoSupport message content collected in files with the original file size you specify.

[-size-compressed {<integer>[KB|MB|GB|TB|PB]}] - Compressed Size

Use this parameter to display information about only AutoSupport message content collected in files with the compressed file size you specify.

Examples

This example displays the content of AutoSupport message number 372 on the node "node1".

```
cluster1::> system node autosupport manifest show -node node1 -seq-num 372
```

Node	Sequence	AutoSupport Body Filename	Collected Size	Status	Error
node1	372	SYSCONFIG-A.txt	1.73KB	completed	
		OPTIONS.txt	29.44KB	completed	
		software_image.xml	7.56KB	completed	
		CLUSTER-INFO.xml	3.64KB	completed	
		autosupport.xml	12.29KB	completed	
		autosupport_budget.xml	7.01KB	completed	
		autosupport_history.xml	46.52KB	completed	
		X-HEADER-DATA.TXT	717.00B	completed	
		SYSTEM-SERIAL-NUMBER.TXT	35.00B	completed	
		cluster_licenses.xml	3.29KB	completed	
		cm_hourly_stats.gz	151.4KB	completed	
		boottimes.xml	56.86KB	completed	
		rdb_txn_latency_stats_hrly.xml	39.31KB	completed	
		rdb_voting_latency_stats_hrly.xml	3.43KB	completed	

14 entries were displayed.

This example shows how you can use parameters to limit output to specific fields of a specific AutoSupport message. This is helpful when troubleshooting.

```
cluster1::> system node autosupport manifest show -node node5 -seq-num 842 -fields body-file,status,size-collected,time-collected,cmd,cmd-tgt,

```

system node autosupport trigger commands

The AutoSupport Trigger directory

system node autosupport trigger modify

Modify AutoSupport trigger configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Use the `system node autosupport trigger modify` command to enable and disable AutoSupport messages for individual triggers, and to specify additional subsystem reports to include if an individual trigger sends an AutoSupport message.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the node whose AutoSupport trigger configuration is modified.

-autosupport-message <Autosupport Message> - EMS Message

Use this parameter to specify the AutoSupport trigger to modify. AutoSupport triggers are EMS messages whose names begin with "callhome.". However, for the purposes of this command, "callhome." is implied, does not need to be entered, and will not be displayed in command output.

[-to {<enabled|disabled>}] - Deliver to AutoSupport -to Addresses

Use this parameter with the value "enabled" to enable sending AutoSupport messages to the configured "to" addresses.

[-noteto {<enabled|disabled>}] - (DEPRECATED) Deliver to AutoSupport -noteto Addresses

Note: This parameter has been deprecated and might be removed in a future version of Data ONTAP.

Use this parameter with the value "enabled" to enable sending short notes to the configured "noteto" addresses.

[-basic-additional <subsys1,subsys2,...>, ...] - Additional Subsystems Reporting Basic Info

Use this parameter to include *basic* content from the additional subsystems you specify. Content is collected from these subsystems in addition to the default list of subsystems.

[-troubleshooting-additional <subsys1,subsys2,...>, ...] - Additional Subsystems Reporting Troubleshooting Info

Use this parameter to include *troubleshooting* content from the additional subsystems you specify. Content is collected from these subsystems in addition to the default list of subsystems.

[-suppress {true|false}] - Suppress all occurrences of this trigger

Use this parameter with the value "true" to suppress the collection when the AutoSupport message is triggered.

Examples

The following example enables messages to the configured "to" addresses from the `battery.low` trigger on the node `node1`.

```
cluster1::> system node autosupport trigger modify -node node1 -autosupport-message battery.low -to enabled
```

system node autosupport trigger show

Display AutoSupport trigger configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node autosupport trigger show` command displays what system events trigger AutoSupport messages. When a trigger event occurs, the node may send an AutoSupport message to a predefined destination, and a short note to another destination. The full AutoSupport message contains detail for troubleshooting. The short message is meant for short pager or SMS text messages.

Use the [“system node autosupport destinations show” on page 1169](#) command to view available destinations.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-basic]

Use this parameter to display which subsystem information is included as *basic* content when the AutoSupport message is triggered.

| [-troubleshooting]

Use this parameter to display which subsystem information is included as *troubleshooting* content when the AutoSupport message is triggered.

| [-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Use this parameter to display AutoSupport triggers only on the node you specify.

[-autosupport-message <Autosupport Message>] - EMS Message

Use this parameter to display only AutoSupport triggers with the name you specify. AutoSupport triggers are EMS messages whose names begin with "callhome.". However, for the purposes of this command, "callhome." is implied, does not need to be entered, and will not be displayed in command output.

[-to {enabled|disabled}] - Deliver to AutoSupport -to Addresses

Use this parameter with the value "enabled" to display only AutoSupport messages that send full messages to the "to" address when triggered. Use this parameter with the value "disabled" to display only AutoSupport messages that do not send full messages.

[-noteto {enabled|disabled}] - (DEPRECATED) Deliver to AutoSupport -noteto Addresses

Note: This parameter has been deprecated and might be removed in a future version of Data ONTAP.

Use this parameter with the value "enabled" to display only AutoSupport messages that send short notes to the "noteto" address when triggered. Use this parameter with the value "disabled" to display only AutoSupport messages that do not send short notes.

[-basic-default <subsys1,subsys2,...>, ...] - Default Subsystems Reporting Basic Info

Use this parameter to display only AutoSupport triggers that include in their messages, by default, *basic* content from the subsystems you specify.

[-troubleshooting-default <subsys1,subsys2,...>, ...] - Default Subsystems Reporting Troubleshooting Info

Use this parameter to display only AutoSupport triggers that include in their messages, by default, *troubleshooting* content from the subsystems you specify.

[-additional-content <Type of AutoSupport content>, ...] - Additional Content Flag

Use this parameter to display only AutoSupport triggers that have been configured to include additional *basic* or *troubleshooting* content.

[-basic-additional <subsys1,subsys2,...>, ...] - Additional Subsystems Reporting Basic Info

Use this parameter to display only AutoSupport triggers that have been configured to include additional *basic* content from the subsystems you specify.

[-troubleshooting-additional <subsys1,subsys2,...>, ...] - Additional Subsystems Reporting Troubleshooting Info

Use this parameter to display only AutoSupport triggers that have been configured to include additional *troubleshooting* content from the subsystems you specify.

[-suppress {true|false}] - Suppress all occurrences of this trigger

Use this parameter with the value "true" to display only AutoSupport messages that have been suppressed.

Examples

This example shows the first page of output from the command. Note that "q" was pressed at the prompt to quit.

```
cluster1:: system node autosupport trigger show
```

Node	AutoSupport Message	To	Note To	Additional Content
node1	aggr.offline	enabled	enabled	-

system node coredump commands

Manage coredumps

system node coredump delete

Delete a coredump

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node coredump delete` command deletes a specified core dump. If the command is issued while the specified core dump is being saved, the command prompts you before stopping the save operation and deleting the core dump.

Parameters

-node <nodename>|local - Node That Owns the Coredump

This specifies the node from which core files are to be deleted.

[-type {kernel|ancillary-kernel-segment|application}] - Coredump Type

This specifies the type of core file to be deleted. If the type is `kernel`, the specified kernel core file will be deleted. If the type is `application`, the specified application core file will be deleted.

-corename <text> - Coredump Name

This specifies the core file that is to be deleted.

Examples

The following example deletes a core dump named `core.101268397.2010-05-30.19_37_31.nz` from a node named `node0`:

```
cluster1::> system node coredump delete -node node0 -corename core.101268397.2010-05-30.19_37_31.nz
```

system node coredump delete-all

Delete all coredumps owned by a node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node coredump delete-all` command deletes either all unsaved core dumps or all saved core files on a node. You can specify whether saved core files or unsaved core dumps are deleted by using the optional `-saved` parameter. If the command is issued while a core dump is being saved, the command prompts you before stopping the save operation and deleting the core dump.

Parameters

-node <nodename> - Node That Owns the Coredump

This specifies the node from which core files or core dumps are to be deleted.

[-type {unsaved-kernel|saved-kernel|kernel|application|all}] - Type of Core to delete

This parameter specifies the type of core file to be deleted. If the type is `unsaved`, all unsaved core dumps will be deleted. If the type is `saved`, all saved core files will be deleted. If the type is `kernel`, all kernel core files and kernel core dumps will be deleted. If the type is `application`, all application core files will be deleted. If the type is `all`, all core files will be deleted. The default setting is to delete only unsaved kernel core dumps and core files.

Examples

The following example deletes all unsaved kernel core dumps on a node named `node0`:

```
cluster1::> system node coredump delete-all -node node0
```

system node coredump save

Save an unsaved kernel coredump

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node coredump save` command saves a specified core dump. If the node has already attempted to save the core dump by the value specified by the `-save-attempts` parameter, the command prompts you before continuing. The `-save-attempts` parameter is set by invoking the command [“system node coredump config modify” on page 1189](#). A saved core dump can be uploaded to a remote site for support analysis; see the [“system node coredump upload” on page 1188](#) command man page for more information.

Parameters

-node <nodename>|local - Node That Owns the Coredump

This specifies the node on which the core dump is located.

-corename <text> - Coredump Name

This specifies the core dump that is to be saved.

Examples

The following example saves a core dump named `core.101268397.2010-05-30.19_37_31.nz` on a node named `node0`:

```
cluster1::> system node coredump save -node node0 -corename core.101268397.2010-05-30.19_37_31.nz
```

system node coredump save-all

Save all unsaved kernel coredumps owned by a node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node coredump save-all` saves all unsaved core dumps on a specified node. If the node has already attempted to save the core dump by the value set by the `-save-attempts` parameter, the command prompts you before continuing. The `save-attempts` parameter is set by invoking the command `system node coredump config modify`.

Parameters

-node <nodename> - Node That Owns the Coredump

This specifies the node on which unsaved core dumps are to be saved.

Examples

The following example saves all unsaved core dumps on a node named `node0`:

```
cluster1::> system node coredump save-all -node node0
```

system node coredump show

Display a list of coredumps

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node coredump show` command displays basic information about core dumps, such as the core dump name, time of panic that triggered the core dump and whether the core file is saved. You can specify optional parameters to display information that matches only those parameters. For example, to display the list of kernel core files, run the command with `-type kernel`.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-system]

If you specify this parameter, the command displays the following information:

- Node name
- Core dump name
- Core dump ID
- Node that panicked and generated the core
- System ID of the node that panicked and generated the core
- Version of the core

| [-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node That Owns the Coredump

If you specify both this parameter and the `-corename` parameter, the command displays detailed information about the specified core. If you specify this parameter by itself, the command displays information about the core files on the specified node.

[-type {kernel|ancillary-kernel-segment|application}] - Coredump Type

This parameter specifies the type of core files to be displayed. If the type is `kernel` and the system supports segmented core files, the command displays information about primary kernel core segment files. If the type is `kernel` and the system does not support segmented core files, the command displays information about full core files. If the type is `ancillary-kernel-segment`, the command displays information about ancillary kernel core segment files. If the type is `application`, the command displays information about application core files. If no type is specified, the command displays information about core files of type `kernel` or `application`.

[-corename <text>] - Coredump Name

If you specify both this parameter and the `-node` parameter, the command displays detailed information about the specified core. If you specify this parameter by itself, the command displays information about the core files that match the specified name.

[-panic-node <text>] - Node That Generated Core

If you specify this parameter with a node name, the command displays information only about the core files that were generated when the specified node panicked.

[-panic-systemid <integer>] - System ID of Node That Generated Core

If you specify this parameter, the command displays information only about the core files that were generated when the node with the specified system ID panicked.

[-version <text>] - Data ONTAP Version of Core

If you specify this parameter, the command displays information only about the core files that match the specified version.

[-panic-time <MM/DD/YYYY HH:MM:SS>] - Time of Panic That Generated Core

If you specify this parameter, the command displays information only about the core files that were generated by a panic at the specified time. Specify time in the format of `MM/DD/YYYY HH:MM:SS [+ HH:MM]`. You can use `[+ HH:MM]` to specify the time range within which all core files triggered by a panic are displayed. `[+ HH:MM]` is relative to UTC.

[-panic-string <text>] - Panic String

If you specify this parameter, the command displays information only about the core files that match the specified panic string.

[-is-saved {true|false}] - Saved Core

If you specify this parameter, the command displays information only about the core dumps that are or are not saved yet to a core file.

[-is-partial {true|false}] - Partial Core

If you specify this parameter, the command displays information only about the core dumps that are or are not partially saved.

[-save-attempts <integer>] - Number of Attempts to Save Core

If you specify this parameter, the command displays information only about the core dumps that have the specified number of successful or failed save attempts.

[-space-needed {<integer>[KB|MB|GB|TB|PB]}] - Space Needed To Save Core

If you specify this parameter, the command displays information only about the core dumps that need the specified amount of disk space to save into a core file.

[-size <text>] - Size of Core (bytes)

If you specify this parameter, the command displays information only about the saved core files that are of the specified size.

[-md5-data-chksum <text>] - MD5 Checksum of the Compressed Data of Core

If you specify this parameter, the command displays information only about the saved core files that have the specified MD5 checksum for compressed data of the core.

[-ancillary-segment-directory <text>] - Directory Holding Ancillary Kernel Core Segments

If you specify this parameter, the command displays information only about the saved core files that have the specified ancillary segment directory.

Examples

The following examples display information about the core files:

```
cluster1::> system node coredump show
Node   Core Name                               Saved  Panic Time
-----
node0
  core.101182345.2010-02-01.14_19_08.nz    false  2/1/2010 09:19:08
    Partial Core: false
    Number of Attempts to Save Core: 2
    Space Needed To Save Core: 4.45GB
node1
  core.101268397.2010-05-30.19_37_31.nz    true   5/30/2010 15:37:31
node2
  core.101270930.2010-09-06.18_40_03.nz    true   9/6/2010 14:40:03
node3
  core.101271326.2010-09-06.19_06_18.nz    true   9/6/2010 15:06:18
  core.101271326.2010-09-06.19_09_49.nz    true   9/6/2010 15:09:49
4 entries were displayed.
cluster1::> system node coredump show -panic-time 9/6/2010 15:00:00+3:00
Node   Core Name                               Saved  Panic Time

  core.101271326.2010-09-06.19_09_49.nz    true   9/6/2010 15:09:49
2 entries were displayed.
```

system node coredump status

Display kernel coredump status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node coredump status` command displays status information about core dumps. The command output depends on the parameters specified with the command. If a core dump is in the process of being saved into a core file, the command also displays its name, the total number of blocks that are to be saved, and the current number of blocks that are already saved.

You can specify additional parameters to display only information that matches those parameters. For example, to display coredump status information about the local node, run the command with the parameter `-node local`.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-disks]

If you specify this parameter, the command displays the following information:

- Node name
- Total number of disks
- Number of spare disks
- Number of disks used
- Number of disks with partial cores

| [-spraycore]

If you specify this parameter, the command displays the following information:

- Node name
- Whether spray cores are supported
- Number of spray-core disks
- Number of spray-core blocks
- Number of disks needed for spray core
- Estimated number of blocks needed for spray core

| [-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

If you specify this parameter, the command displays the following information:

- Node name
- State of the core-dump process
- Space available on the internal file system
- Name of the core being saved, if applicable
- Total number of blocks in the core being saved, if applicable
- Number of blocks currently saved, if applicable
- Type of core dump
- Number of unsaved complete cores on the node
- Number of unsaved partial cores on the node
- Whether spray cores are supported on the node
- Whether any spare disks are available on the node
- Number of disks that have cores
- Number of unsaved cores
- Number of disks that have partial cores
- Number of partial cores
- Number of unused spray-core disks

- Number of spray-core blocks
- Number of disks available for core dumps
- Estimated number of blocks needed for spray core
- Number of disks needed for spray core

[-state <text>] - State

If you specify this parameter, the command displays information only about the nodes that are in the specified core dump state. Possible values include: nocore, idle, init, saving, and waitdump.

[-space-available {<integer>[KB|MB|GB|TB|PB]}] - Space Available On Internal Filesystem

If you specify this parameter, the command displays information only about the nodes that have the specified amount of available space, in bytes, on their internal file systems.

[-corename <text>] - Name of Core Being Saved

If you specify this parameter, the command displays information only about the node that is currently saving the specified core file name.

[-total-blocks <integer>] - Total Number of Blocks in Core Being Saved

If you specify this parameter, the command displays information only about the nodes that have the specified number of blocks in the core dump being saved.

[-blocks-saved <integer>] - Number of Blocks saved

If you specify this parameter, the command displays information only about the nodes that have the specified number of blocks saved.

[-type <text>] - Type of Core Dump

If you specify this parameter, the command displays information only about the nodes that have the specified core dump type. Possible values include zipped, sprayed, and spare.

[-spraycore-supported {true|false}] - Spray Core Supported on Node

If you specify this parameter, the command displays information only about the nodes that do or do not support the spray method of dumping core.

[-spares-available {true|false}] - Spare Disk(s) Available on Node

If you specify this parameter, the command displays information only about the nodes that do or do not have spare disks available.

[-disks-used <integer>] - Number of Disks with Cores

If you specify this parameter, the command displays information only about the nodes that have the specified number of disks that contain core dumps.

[-unsaved-cores <integer>] - Number of Unsaved Complete Cores

If you specify this parameter, the command displays information only about the nodes that have the specified number of complete core dumps that are not yet saved into a core file.

[-partial-disks <integer>] - Number of Disks with Partial Cores

If you specify this parameter, the command displays information only about the nodes that have the specified number of disks with partial core dumps.

[-partial-cores <integer>] - Number of Unsaved Partial Cores

If you specify this parameter, the command displays information only about the nodes that have the specified number of partial core dumps that are not yet saved into a core file.

[-spraycore-disks <integer>] - Number of Unused Spray Core Disks

If you specify this parameter, the command displays information only about the nodes that have the specified number of unused spray-core disks.

[-spraycore-blocks <integer>] - Number of Spray Core Blocks

If you specify this parameter, the command displays information only about the nodes that have the specified number of spray-core blocks.

[-numdisks <integer>] - Total Number of Disks Available for Core Dump

If you specify this parameter, the command displays information only about the nodes that have the specified total number of disks available for core dump.

[-blocks-needed <integer>] - Estimated Number of Blocks Needed for Spray Core

If you specify this parameter, the command displays information only about the nodes that have the specified number of estimated blocks needed for the spray method of dumping core.

[-disks-needed <integer>] - Number of Disks Needed for Spray Core

If you specify this parameter, the command displays information only about the nodes that have the specified number of disks needed for the spray method of dumping core.

[-space-needed {<integer>[KB|MB|GB|TB|PB]}] - Space Needed to Save All Unsaved Cores

If you specify this parameter, the command displays information only about the nodes that require the specified amount of disk space to save all unsaved core dumps.

[-min-free {<integer>[KB|MB|GB|TB|PB]}] - Minimum Free Bytes on Root Filesystem

If you specify this parameter, the command displays information only about the nodes that need to have the specified number of bytes available on the root filesystem after a core dump is saved.

Examples

The following example displays core dump information about the node named node0:

```
cluster1::> system node coredump status -node node0 -instance
```

```

                                Node: node0
                                State: idle
    Space Available On Internal Filesystem: 132.1GB
    Name of Core Being Saved: -
Total Number of Blocks in Core Being Saved: -
    Number of Blocks saved: -
                                Type of core dump: spray
    Number of Unsaved Complete Cores: 0
    Number of Unsaved Partial Cores: 1
    Space Needed To Save All Unsaved Cores: 4.81GB
    Minimum Free Bytes On Internal Filesystem: 250MB
```

system node coredump trigger

Make the node dump system core and reset

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command triggers a Non-maskable Interrupt (NMI) on the specified node via the Service Processor of that node, causing a dirty shutdown of the node. This operation forces a dump of the kernel core when halting the node. LIF migration or storage takeover occurs as normal in a dirty shutdown. This command is different from the -dump parameter of the [“system node shutdown” on page 1146](#), [“system node halt” on page 1146](#), or [“system node reboot” on page 1149](#) command in that this command uses a control flow through the Service Processor of the remote node, whereas the -dump parameter uses a communication channel between Data ONTAP running on the nodes. This command is helpful in cases where Data ONTAP on the remote node is hung or does not respond for some reason. If the panic node reboots back up, then the generated coredump can be seen by using the [“system node coredump show” on page 1182](#) command. This command works for a single node only and the full name of the node must be entered exactly.

Parameters**-node {<nodename>|local} - Node**

This parameter specifies the node for which you want to trigger a coredump.

Examples

The following example triggers a NMI via the Service Processor and causes node2 to panic and generate a coredump. Once node2 reboots back up, the command [“system node coredump show” on page 1182](#) can be used to display the generated coredump.

```
cluster1:: set advanced

Warning: These advanced commands are potentially dangerous; use them only when
        directed to do so by NetApp personnel.
Do you want to continue? [y|n]: y

cluster1::* system node coredump trigger -node node2

Warning: The Service Processor is about to perform an operation that will cause
        a dirty shutdown of node "node2". This operation can
        cause data loss. Before using this command, ensure that the cluster
        will have enough remaining nodes to stay in quorum. To reboot or halt
        a node gracefully, use the "system node reboot" or "system node halt"
        command instead. Do you want to continue? [yes|no]: yes

Warning: This operation will reboot the current node. You will lose this login
        session. Do you want to continue? [y|n]: y

cluster1::*
cluster1:: system coredump show
Node:Type Core Name                               Saved Panic Time
-----
node2:kernel
        core.1786429481.2013-10-04.11_18_37.nz      false 10/4/2013 11:18:37
        Partial Core: false
        Number of Attempts to Save Core: 0
        Space Needed To Save Core: 3.60GB
1 entries were displayed.

cluster1::
```

system node coredump upload

(DEPRECATED)-Upload a coredump to a remote site

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Attention: This command is deprecated and might be removed in a future release of Data ONTAP. Use "[“system node autosupport invoke-core-upload” on page 1159](#)" instead.

The `system node coredump upload` command uploads a saved core file to a specified URL. You should use this command only at the direction of technical support.

Parameters

-node {<nodename>|local} - Node That Owns the Coredump

This specifies the node on which the core file is located.

[-type {kernel|ancillary-kernel-segment|application}] - Coredump Type

This specifies the type of core files to be uploaded. If the type is kernel, kernel core files will be uploaded. If the type is application, application core file will be uploaded.

-corename <text> - Coredump Name

This specifies the name of the core file that is to be uploaded.

[-location <text>] - URL for Coredump Upload Directory

This specifies the URL to which the core file is to be uploaded. If this parameter is not specified, the command uploads the core file to the location specified by the `-upload-location` parameter of the [“system node coredump config modify” on page 1189](#) command. The following protocols are supported: ftp and http. (By default, the location is set to `ftp://ftp.netapp.com/to-ntap/`)

[-casenum <integer>] - Case Number

This specifies the support case number that will be prefixed to the core file name at the destination. The case number is critical information for quick and automated processing of the received core file.

Examples

The following example uploads a core file named core.07142005145732.2010-10-05.19_03_41.nz on a node named node0 to the default location. The support case number is 2001234567.

```
cluster1::> system node coredump upload -node node0 -corename core.07142005145732.2010-10-05.19_03_41.nz -casenum 2001234567
```

system node coredump config commands

Manage the coredump configuration

system node coredump config modify

Modify coredump configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node coredump config modify` command modifies the cluster's core dump configuration.

Parameters**-node {<nodename>|local} - Node**

This parameter specifies the node whose coredump configuration you want to modify.

[-sparsecore-enabled {true|false}] - Enable Sparse Cores

If you set this parameter to true, the command enables sparse cores. A sparse core omits all memory buffers that contain only user data.

[-min-free {<integer>[KB|MB|GB|TB|PB]] - Minimum Free Bytes On Root Filesystem

If you specify this parameter, the command displays the number of bytes that need to be made available in the root file system after saving the core dump. If the minimum number of bytes cannot be guaranteed, core dumps are not generated. The default setting is 250 MB.

[-coredump-attempts <integer>] - Maximum Number Of Attempts to Dump Core

If you specify this parameter, the command displays the maximum number of times the system will attempt to generate a core dump when encountering repeated disk failures. The default setting is 2.

[-save-attempts <integer>] - Maximum Number Attempts to Save Core

If you specify this parameter, the command displays the maximum number of times the system will attempt to save a core dump. The default setting is 2.

[-save-onstartup {true|false}] - Enable Auto Save of Coredumps on Startup

If you set this parameter to true, the system will automatically start saving the core dump after reboot.

[-upload-location <text>] - URL for Coredump Upload Directory

Attention: This option is deprecated and might be removed in a future release of Data ONTAP. Use the `-uri` parameter of the "[system node autosupport invoke-core-upload](#)" on page 1159" command instead.

If you specify this parameter, the system uploads the core dumps to the specified URL. The following protocols are supported: ftp and http. (The default setting is ftp://ftp.netapp.com/to-ntap/.)

Examples

The following example sets the maximum number of core dump attempts to 5 and the maximum number of save attempts to 5:

```
cluster1::> system node coredump config modify -coredump-attempts 5 -save-attempts 5
```

system node coredump config show

Display coredump configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node coredump config show` command displays basic information about a cluster's core dump configuration, such as whether sparse cores are enabled, minimum number of free bytes on the root volume file system that need to be available after saving the core files, maximum number of times the process attempts to generate a core dump when encountering repeated disk failures, maximum number of times the process attempts to save a core dump, the URL to which core dumps are uploaded, and whether core dumps are automatically saved when a node restarts.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

If you specify this parameter, the command displays the coredump configuration information of the specified node.

[-sparsecore-enabled {true|false}] - Enable Sparse Cores

If you specify this parameter, the command displays only the coredump information that matches the specified sparse core setting. A sparse core omits all memory buffers that contain only user data.

[-min-free {<integer>[KB|MB|GB|TB|PB]}] - Minimum Free Bytes On Root Filesystem

If you specify this parameter, the command displays only the core dump information that matches the specified number of bytes that need to be made available in the root file system after saving the core dump.

[-coredump-attempts <integer>] - Maximum Number Of Attempts to Dump Core

If you specify this parameter, the command displays only the core dump information that matches the specified maximum number of times the system will attempt to generate a core dump when encountering repeated disk failures.

[-save-attempts <integer>] - Maximum Number Attempts to Save Core

If you specify this parameter, the command displays only the coredump information that matches the maximum number of times the system will attempt to save a core dump.

[-save-onstartup {true|false}] - Enable Auto Save of Coredumps on Startup

If you specify this parameter, the command displays only the coredump information that matches the specified configuration of whether the system will automatically start saving the core dump after reboot.

[-upload-location <text>] - URL for Coredump Upload Directory

Attention: This option is deprecated and might be removed in a future release of Data ONTAP. Use the `-uri` parameter of the "[system node autosupport invoke-core-upload](#)" on page 1159" command instead.

If you specify this parameter, the command displays only the core dump information that matches the specified URL where core dumps are uploaded.

Examples

The following example displays information about the cluster's core dump configuration:

```
cluster1::> system node coredump config show
```

Node	Sparse Core Enabled	Min Free Bytes	Max Dump Attempts	Max Save Attempts	On Startup Enabled	Coredump Location
node0	true	250MB	2	2	true	ftp://ftp.example.com/to-example/
node1	true	250MB	2	2	true	ftp://ftp.example.com/to-example/
node2	true	250MB	2	2	true	ftp://ftp.example.com/to-example/
node3	true	250MB	2	2	true	ftp://ftp.example.com/to-example/

4 entries were displayed.

system node coredump external-device commands

Manage coredumps saved on an external device

system node coredump external-device save

Save a coredump to an external USB device

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system node coredump external-device save` command saves a specified core dump to an external USB device plugged into the port specified by the `-device` parameter.

External USB device requirements:

- A device formatted as FAT32 can be used to save a core dump smaller than 4GB.
- To save a core dump larger than 4GB, format the device with the ext2 filesystem with the `largefile` flag set. This can be done using the following command on a Linux host: `mkfs.ext2 -T largefile <device_name>`
- The command [“system node coredump show” on page 1182](#) can be used to determine the size of the core dump.

Parameters

-node {<nodename>|local} - Node That Owns the Coredump

This specifies the node on which the core dump is located.

-device {usb0|usb1} - Device

This specifies the port on the node to which the external USB device is connected, for example: `usb0`.

-corename <text> - Coredump Name

This specifies the core dump that is to be saved.

Examples

The following example saves a core dump named `core.101268397.2010-05-30.19_37_31.nz` on `node1` to an external USB device in port `usb0`:

```
cluster1::> system node coredump external-device save -node node1 -device usb0 -corename core.101268397.2010-05-30.19_37_31.nz
```

system node coredump external-device show

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system node coredump external-device show` command displays basic information about files on an external USB device, such as the filename and size.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

-node {<nodename>|local} - Node That Owns the Coredump

This parameter selects the node that has files that are to be displayed on the external USB device.

[-device {usb0|usb1}] - Device

This parameter specifies the name of the external device, for example: usb0.

[-corename <text>] - Coredump Name

This parameter specifies the core dump file for which the information is displayed.

[-size {<integer>[KB|MB|GB|TB|PB]}] - Size of Core

If specified, the command displays information only about the core files that are of the specified size.

Examples

The following example displays information about core files stored on external USB devices:

```
cluster1::> system node coredump external-device show
Node           Device  Coredump Name
-----
node1          usb0    core.537051938.2017-10-26.23_52_15.nz
                        Size: 13074695581 bytes (12.18) GB
```

system node coredump reports commands

Manage application core reports

system node coredump reports delete

Delete an application core report

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node coredump reports delete` command deletes the specified application core report.

Parameters

-node {<nodename>|local} - Node That Owns the Coredump

This specifies the node from which reports are to be deleted.

-reportname <text> - Report Name

This specifies the report that is to be deleted.

Examples

The following example shows how a report named `notifyd.1894.80335005.2011-03-25.09_59_43.ucore` report is deleted from a node named `node0`:

```
cluster1::> system node coredump reports delete -node node0 -reportname notifyd.1894.80335005.2011-03-25.09_59_43.ucore.report
```

system node coredump reports show

Display a list of application core reports

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node coredump reports show` command displays basic information about application core reports, such as the report name and time of the panic that triggered the application core dump. You can specify optional parameters to display information that matches only those parameters. For example, to display the list of reports in the local node, run the command with `-node local`.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node That Owns the Coredump

Selects information about all the reports on the specified node. If you specify both this parameter and the `-reportname` parameter, the command displays detailed information about the specified report.

[-reportname <text>] - Report Name

Selects information about the reports that match the specified name. If you specify both this parameter and the `-node` parameter, the command displays detailed information about the specified report.

[-panic-node <text>] - Node That Generated Core

Selects information about the reports that were generated by the specified node.

[-panic-systemid <integer>] - System ID of Node That Generated Core

Selects information about the reports that were generated by the node with the specified system ID.

[-version <text>] - Data ONTAP Version of Core

Selects information about the reports that match the specified version.

[-panic-time <MM/DD/YYYY HH:MM:SS>] - Time of Panic That Generated Core

Selects information about the reports that were generated by a panic at the specified time. Specify time in the format of `MM/DD/YYYY HH:MM:SS [+ HH:MM]`. You can use `[+ HH:MM]` to specify the time range within which all core files triggered by a panic are displayed. `[+ HH:MM]` is relative to UTC.

[-panic-string <text>] - Panic String

Selects information about the reports that match the specified panic string.

Examples

The following example displays information about the reports:

```
cluster1::> system node coredump reports show
Node      Report Name                                     Panic Time
-----
node0notifd.1894.80335005.2011-03-25.09_59_43.ucore.report3/25/2011 09:59:43
```

system node coredump reports upload

(DEPRECATED)-Upload an application core report to a remote site

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Attention: This command is deprecated and might be removed in a future release of Data ONTAP. See core report information in the SmartSoft tool.

The `system node coredump reports upload` command uploads an application report to a specified URL. You should use this command only at the direction of technical support.

Parameters

-node {<nodename>|local} - Node That Owns the Coredump

This specifies the node on which the report is located.

-reportname <text> - Report Name

This specifies the name of the report that is to be uploaded.

[-location <text>] - URL for Coredump Upload Directory

This specifies the URL to which the report is to be uploaded. The following protocols are supported: ftp and http. (By default, the location is set to ftp://ftp.netapp.com/to-ntap/)

[-casenum <integer>] - Case Number

This specifies the support case number that is be prefixed to the core file name at the destination. The case number is critical information for quick and automated processing of the received core file.

Examples

The following example shows how a report named notifyd.1894.80335005.2011-03-25.09_59_43.ucore.bz2 is uploaded on a node named node0 to the default location. The support case number is 2001234567.

```
cluster1::> system node coredump reports upload -node node0 -corename notifyd.1894.80335005.2011-03-25.09_59_43.ucore.bz2 -casenum 2001234567
```

system node coredump segment commands

Manage Core Segments

system node coredump segment delete

Delete a core segment

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command deletes a core segment.

Parameters

-node {<nodename>|local} - Node

This specifies the node on which to delete the core segments.

-segment <text> - Core Segment

This specifies the core segment to delete. The pathname is relative to the coredump directory. If a directory is specified, all core segment files within it are deleted. If the directory is empty, it is deleted.

[-owner-node <text>] - Node That Owns the Core Segment File

This specifies the node that owns the core segment. Use this parameter only in takeover mode to delete a partner's coredump segment.

Examples

This deletes all core segments in the directory, *core.151708240.2012-01-11.05_56_52*.

```
cluster1::> system node coredump segment delete -node node1 -segment core.151708240.2012-01-11.05_56_52
```

system node coredump segment delete-all

Delete all core segments on a node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command deletes all the core segments on a node.

Parameters

-node {<nodename>|local} - Node

This specifies the node on which to delete the core segments.

Examples

This deletes all the core segments for *node1*.

```
cluster1::> system node coredump segment delete-all -node node1
```

system node coredump segment show

Display a list of core segments

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the following information about core segments:

- name of the core segment directory
- time of the panic that generated the core segment
- total number of core segment files
- core segment file name

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

Displays the following details:

- Core segment file name
- Node that owns the core segment file
- System ID of the node that generated the core
- MD5 checksum of the compressed data of the core segment file
- Name of the core segment
- Total number of core segments for the core file
- Timestamp of the panic that triggered the core segment

[-node {<nodename>|local}] - Node

Selects information about the core segments on the specified node.

[-segment <text>] - Core Segment

Selects information about the specified core segment. If segment is a directory, the command displays the information for the first core segment file. If segment is a file, the command displays the file information.

[-owner-node <text>] - Node That Owns the Core Segment File

Selects information about the core segments owned by the specified node. This parameter should only be used in takeover mode to display information about the partner's core segments.

[-panic-system-id <integer>] - System ID of Node That Generated Core

Selects information about the core segments that were generated when the node with the specified system ID panicked.

[-md5-data-chksum <text>] - Md5 Checksum of the Compressed Data of the Core Segment

Selects information about the core segments whose data segment's MD5 checksum matches the specified checksum.

[-segment-name <text>] - Name of the Core Segment

Selects information about the core segments with the specified name.

[-total-segment-count <integer>] - Number of Segments Generated

Selects information about the core segments with the specified name.

[-panic-time <MM/DD/YYYY HH:MM:SS>] - Time of Panic That Generated Core

Selects information about the core segments that were generated by a panic at the specified time.

[-size <text>] - Size of Core Segment (bytes)

Selects information about the core segments that are of the specified size.

[-panic-string <text>] - Panic String of Panic That Generated Core

Selects information about the core segments that match the specified panic string.

Examples

The example below displays the core segments on *node1*.

```
cluster1::> system node coredump segment show -node node1
Node: node1

Segment Directory: core.118049106.2012-01-05.17_11_11
Panic Time: 1/5/2012 12:11:11
Number of Segments: 2
Segment File Name:
    core.118049106.2012-01-05.17_11_11.nvram.nz
    core.118049106.2012-01-05.17_11_11.ontap.nz

2 entries were displayed.
```

The example below displays detailed information a specific core segment file on *node1*.

```
cluster1::> system node coredump segment show -node node1 -segment core.118049106.2012-01-05.17_11_11.ontap.nz -instance

Node: node1
Core Segment: core.118049106.2012-01-05.17_11_11.ontap.nz
Node That Owns the Core Segment File: node1
System ID of Node That Generated Core: 118049106
Md5 Checksum of the Compressed Data of the Core Segment: 1a936d805dcd4fd5f1180fa6464fdee4
Name of the Core Segment: ontap
Number of Segments Generated: 2
Time of Panic That Generated Core: 1/5/2012 12:11:11
```

system node environment commands

Display fan and temperature information

system node environment sensors commands

Display environment sensors

system node environment sensors show

Display the sensor table

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node environment sensors show` command displays the following information:

- Node name
- Sensor name

- Sensor state
- Sensor value
- Sensor units
- Critically Low threshold for the sensor
- Warning Low threshold for sensor
- Warning High threshold for sensor
- Critically High threshold for the sensor
- FRU name (detailed view only)

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|/local}] - Node

Selects information about the sensors on the specified node. If this parameter is specified with the -name parameter, the command displays information only about the specified sensor.

[-name <text>] - Sensor Name

Selects information about the sensors that have the specified name. If this parameter is specified with the -node parameter, the command displays information only about the specified sensor.

[-fru <text>] - FRU

Selects information about the sensors associated with the specified Field Replaceable Unit (FRU).

[-type {fan|thermal|voltage|current|battery-life|discrete|fru|nvram|counter|minutes|percent|agent|unknown}] - Sensor Type

Selects information about the sensors that have the specified sensor type. Possible values vary among platforms but may include *fan*, *temperature*, *thermal* and *voltage*.

[-units <text>] - Value Units

Selects information about the sensors that have readings displayed in the specified units of measure. Possible values vary among platforms but may include *RPM*, *C* and *mV*.

[-state {normal|warn-low|warn-high|crit-low|crit-high|disabled|uninitialized|init-failed|not-available|invalid|retry|bad|not-present|failed|ignored|fault|unknown}] - Sensor State

Selects information about the sensors that have the specified state. Possible values vary among platforms but may include *normal*, *warn_lo*, *warn_hi*, *crit_lo*, *crit_hi* and *failed*.

[-discrete-state {normal|warn-low|warn-high|crit-low|crit-high|disabled|uninitialized|init-failed|not-available|invalid|retry|bad|not-present|failed|ignored|fault|unknown}] - Discrete Sensor State

Selects information about the discrete-valued sensors that are in the specified state. A discrete-valued sensor has a set of possible discrete values rather than a range of possible values. For example, a presence sensor which has the discrete values PRESENT and NOT_PRESENT is a discrete-valued sensor. Possible values vary among platforms but may include *normal* and *failed*.

[-value <integer>] - Last Sensor Value

Selects information about the sensors that have the specified sensor value.

[-discrete-value <text>] - Discrete Sensor Value

Selects information about the discrete-valued sensors that have the specified discrete value. Possible values vary among sensors but may include *PRESENT*, *NOT_PRESENT*, *ON*, *OFF*, *OK* and *FAULT*.

[-crit-low <integer>] - Critical Low Threshold

Selects information about the sensors that have the specified critically low threshold.

[-warn-low <integer>] - Warning Low Threshold

Selects information about the sensors that have the specified warning-low threshold.

[-warn-hi <integer>] - Warning Hi Threshold

Selects information about the sensors that have the specified warning-high threshold.

[-crit-hi <integer>] - Critical Hi Threshold

Selects information about the sensors that have the specified critically high threshold.

[-inactive {true|false}] - Show Inactive Sensors

Specify *true* to include inactive sensors in the output. By default, only sensors with the value *false* are shown.

[-hidden {true|false}] - Show Hidden Sensors

Specify *true* to include hidden sensors in the output. By default, only sensors with the value *false* are shown.

Examples

The following example displays information about all sensors on a cluster named cluster1:

```
cluster1::> system node environment sensors show
```

Node	Sensor	State	Value/Units	Crit-Low	Warn-Low	Warn-Hi	Crit-Hi

mynode							
	Partner IO Pre						
		NOT_PRESENT					
	Partner Ctrl Pre

[...]

system node external-cache commands

The external-cache directory

system node external-cache modify

Modify external cache settings.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node external-cache modify` command can be used to modify the following attributes of external-cache for a node:

- is-enabled
- is-rewarm-enabled
- is-mbuf-inserts-enabled
- pcs-size
- is-hya-enabled

Parameters

-node {<nodename>|local} - Node

This specifies the node on which the modifications need to be made.

[-is-enabled {true|false}] - Is Enabled

Enables external-cache module (Flash Cache Family) on the storage system. Valid values for this option are true and false. If external-cache hardware is present, then this option will enable external-cache functionality in WAFL. If no hardware is present, this option will enable external-cache pcs (Predictive Cache Statistics). The default value for this option is false.

[-is-rewarm-enabled {true|false}] - Is rewarm on

Specifies whether an external-cache module should attempt to preserve data across reboots. Valid values for this option are true and false. This option applies only to cache hardware with persistent media. It does not apply to Predictive Cache Statistics (PCS). Enabling this option will marginally increase the duration of system boot and shutdown, but it will reduce or eliminate the time required for cache warming. The default value for this option is determined by the cache hardware type. The option is disabled by default.

[-is-mbuf-inserts-enabled {true|false}] - Is Mbuf inserts on

Specifies whether the external-cache module allows insert of mbuf data as part of a network write. In rare cases, inserting mbuf data may cause excessive CPU usage. We provide this workaround to disable the behavior, if necessary. Do not change the value of this option unless directed to do so by technical support. The data from the mbuf network writes can still be stored in the external cache, but only after a subsequent disk read of that data.

[-pcs-size <integer>] - PCS size

Controls the size of the cache emulated by external-cache PCS. Valid values for this option are integers between 16 and 16383. This option is only used when PCS is enabled. The default value for this option is chosen automatically based on the amount of memory in the controller, and the upper limit is further restricted on controllers with smaller amounts of memory.

[-is-hya-enabled {true|false}] - Is hya caching enabled

Specifies whether the external-cache module allows caching of blocks targeted for hybrid aggregates. This option is set to true by default when the external-cache is enabled.

Examples

```
cluster::> system node external-cache modify -node node1 -is-enabled true
```

system node external-cache show

Display external cache settings.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node external-cache show` command displays external-cache information for each of the nodes available.

Parameters**{ [-fields <fieldname>, ...]**

Valid values for this option are {node|is-enabled|is-rewarm-enabled|is-mbuf-inserts-enabled|pcs-size|is-hya-enabled}. Specifying the value will display all entries that correspond to it.

| [-instance]}

This option does not need an input value. Specifying this option will display the information about all the entries.

[-node {<nodename>|local}] - Node

Specify this parameter to display external-cache parameters that match the specified node.

[-is-enabled {true|false}] - Is Enabled

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

[-is-rewarm-enabled {true|false}] - Is rewarm on

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

[-is-mbuf-inserts-enabled {true|false}] - Is Mbuf inserts on

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

[-pcs-size <integer>] - PCS size

Valid values for this option are integers between 16 and 16383. Specifying the value will display all entries that correspond to it.

[-is-hya-enabled {true|false}] - Is hya caching enabled

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

Examples

```
cluster1::> system node external-cache show -node node1
```

```
Node: node1
Is Enabled: false
Is rewarm on: false
Is Mbuf inserts on: true
PCS size: 256
Is hya caching enabled: true
```

system node firmware commands

The system node firmware directory

system node firmware download

Download motherboard firmware and system diagnostics

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system node firmware download` command downloads new system firmware to the boot device. A reboot followed by the 'update_flash' command at the firmware prompt is required for the firmware to take effect.

Parameters

-node {<nodename>|local} - Node

This specifies the node or nodes on which the firmware is to be updated.

-package <text> - Package URL

This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP, FTP and FILE, are accepted. The FILE URL scheme can be used to specify location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as `file://usb0/<filename>`. Typically, the file name is `image.tgz`. The package must be present in the root directory of the USB mass storage device.

Examples

The following example downloads firmware to node-01 from a web server:

```
cluster1::*> system node firmware download -node node-01 -package
```

system node hardware commands

The system node hardware directory

system node hardware nvram-encryption commands

Manage the encryption key when copying NVRAM data to flash device

Commands to configure the encryption feature of NVRAM device.

system node hardware nvram-encryption modify

Configure NVRAM device encryption

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node hardware nvram-encryption modify` command configures the encryption feature for the NVRAM or NVMEM data that is destaged to non-volatile flash storage.

Note: This feature might be restricted in some countries due to local regulations concerning encrypted data.

Parameters

-node {<nodename>|local} - Node

Specifies the node containing the NVRAM or NVMEM subsystem.

[-is-enabled {true|false}] - Is Encryption Enabled

Specifies whether the NVRAM or NVMEM encryption is disabled or enabled.

Examples

The following commands enable or disable the NVRAM encryption:

```
cluster1::> system node hardware nvram-encryption modify -node node1 -is-enabled false
cluster1::> system node hardware nvram-encryption modify -node node1 -is-enabled true
```

system node hardware nvram-encryption show

Show NVRAM device encryption information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node hardware nvram-encryption show` command displays the configuration of the encryption feature for the NVRAM or NVMEM data that is destaged to non-volatile flash storage.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

If this parameter is specified, the command displays information about the NVRAM encryption configuration on the specified node.

[-nvram-device-name <text>] - NVRAM Device Name

If this parameter is specified, the command displays information about the NVRAM encryption configuration for the specified NVRAM device. Current platforms only support one device - NVRAM.0.

[-is-supported {true|false}] - Is Encryption Support

If this parameter is specified, the command displays information about the NVRAM encryption configuration for platforms that support it.

[-is-enabled {true|false}] - Is Encryption Enabled

If this parameter is specified, the command displays information about the NVRAM encryption configuration for the NVRAM or NVMEM devices where the device has the specified enabled value.

[-key-id <text>] - Key ID of the Encryption Key

If this parameter is specified, the command displays information about the NVRAM encryption configuration with the specified encryption Key ID used to encrypt the NVRAM or NVMEM data on flash storage.

Examples

The following example displays information about the NVRAM encryption configuration on all nodes of the cluster:

```
cluster1::> system node hardware nvram-encryption show
Node: node1
NVRAM-Device: NVRAM.0
Supported: true
Enabled: true
Key-ID: 0000000000000000000000000000000000000000000000000000000000000000
Node: node2
NVRAM-Device: NVRAM.0
Supported: true
Enabled: true
Key-ID: 0000000000000000000000000000000000000000000000000000000000000000
2 entries are displayed.
```

system node hardware tape commands

Manage tape related devices

system node hardware tape drive commands

The drive directory

system node hardware tape drive show

Displays information about tape drives

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the following information about tape drives:

- Node to which the tape drive is attached
- Device ID of the tape drive
- Description of the tape drive
- NDMP path of the tape drive

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

[*-instance*]}

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[*-node* {<nodename>|local}] - Node

Displays detailed information about tape drives on the specified node.

[*-device-id* <text>] - Device ID

Selects information about the tape drive that has the specified device ID.

[*-description* <text>] - Description

Selects information about the tape drive or drives that have the specified description.

[*-wwn* <text>] - World Wide Name

Selects information about the tape drive that has the specified worldwide name.

[*-serial-number* <text>] - Serial Number

Selects information about the tape drive that has the specified serial number.

[*-ndmp-path* <text>, ...] - NDMP Path

Selects information about the tape drive or drives that have the specified NDMP path.

Examples

The following example displays information about all tape drives in the cluster:

```
cluster1::> system node hardware tape drive show
Node   Device Id Drive Description      NDMP Path
-----
cluster1
  brocade-247-198:3.126L1      nrst0l nrst0m nrst0h nrst0a

```

system node hardware tape library commands

The library directory

system node hardware tape library show

Display information about tape libraries

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the following information about tape libraries:

- Node to which the tape library is attached
- Device ID of the tape library
- Description of the tape library
- NDMP path of the tape library

Parameters

{ [*-fields* <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-node <nodename>|local`]] - Node

Displays detailed information about tape libraries on the specified node.

[`-device-id <text>`] - Device ID

Selects information about the tape library that has the specified device ID.

[`-description <text>`] - Description

Selects information about the tape library or libraries that have the specified description.

[`-wwn <text>`] - World Wide Name

Selects information about the tape library that has the specified worldwide name.

[`-serial-number <text>`] - Serial Number

Selects information about the tape library that has the specified serial number.

[`-ndmp-path <text>`] - NDMP Path

Selects information about the tape library or libraries that have the specified NDMP path.

Examples

The following example displays information about all tape libraries attached to the cluster:

```
cluster1::> system node hardware tape library show
Node   Device Id Drive Description   NDMP Path
-----
cluster1-00
      0b.125L1 HP      MSL G3      mc1
           Series
      0c.125L1 HP      MSL G3      mc0
           Series
2 entries were displayed.
```

system node hardware unified-connect commands

Manage Fibre Channel and converged networking adapters

Commands used for managing Fibre Channel and converged networking adapters.

system node hardware unified-connect modify

Modify the Fibre Channel and converged networking adapter configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node hardware unified-connect modify` command changes the adapter configuration. Any changes to the adapter mode or type will require a reboot for the changes to take effect. The adapter must also be offline before you can make any changes.

The adapter argument is in the form `Xy` where `X` is an integer and `y` is a letter. For example: `4a`

For a target adapter, use the [“network fcp adapter modify” on page 326](#) command to bring the adapter offline.

For an initiator adapter, use the `system node run local storage disable adapter` command to take the adapter offline.

The `-mode` parameter refers to the mode of the adapter and can be either *fc* or *cna*.

The `-type` parameter refers to the FC-4 type of the adapter and can be *initiator*, *target*, or *fcvi*.

The `-force` parameter suppresses confirmation prompts.

Note: The adapter type *fcvi* is supported only on platforms with FCVI adapters.

Parameters

-node {<nodename>|local} - **Node**
Specifies the node of the adapter.

-adapter <text> - **Adapter**
Specifies the adapter.

[-mode | -m {fc|cna}] - **Configured Mode**
Specifies the mode.

[-type | -t {initiator|target|fcvi}] - **Configured Type**
Specifies the FC-4 type.

[-force | -f [true]] - **Force**
Suppresses warnings and confirmation prompts.

Examples

```
cluster1::> system node hardware unified-connect modify -node node1 -adapter 0d -mode cna
```

system node hardware unified-connect show

Displays information about Fibre Channel and converged networking adapters

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command manages Fibre Channel and converged networking adapters used by the storage subsystem. Use the command to show the current mode and FC-4 type of adapters or the capabilities of adapters.

Parameters

{ [-fields <fieldname>, ...]
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-capability]
If this parameter is specified, the command displays the capabilities of the adapters.

| [-instance]}
If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - **Node**
If this parameter is specified, the command displays information about Fibre Channel and converged networking adapters on the specified node.

[-adapter <text>] - **Adapter**
If this parameter is specified, the command displays information about the specified adapter.

[-current-mode {fc|cna}] - **Current Mode**
If this parameter is specified, the command displays adapters configured to the specified mode.

[-current-type {initiator|target|fcvi}] - **Current Type**
If this parameter is specified, the command displays adapters configured to the specified FC-4 type.

[-pending-mode {fc|cna}] - **Pending Mode**

If this parameter is specified, the command displays adapters configured to the specified mode on the next reboot.

[-pending-type {initiator|target|fcvi}] - Pending Type

If this parameter is specified, the command displays adapters configured to the specified FC-4 on the next reboot.

[-status-admin <text>] - Administrative Status

If this parameter is specified, the command displays adapters with the specified status.

[-supported-modes {fc|cna}, ...] - Supported Modes

The list of modes that the adapter supports.

[-supported-fc-types {initiator|target|fcvi}, ...] - Supported FC Types

The list of FC-4 types the adapter supports when configured into fc mode.

[-supported-cna-types {initiator|target|fcvi}, ...] - Supported CNA Types

The list of FC-4 types the adapter supports when configured into cna mode.

Examples

The following example displays information about all Fibre Channel and converged networking adapters in the cluster:

```
cluster1::> system node hardware unified-connect show
Node      Adapter  Current Mode  Current Type  Pending Mode  Pending Type  Admin Status
-----
node1     0c       fc         initiator -          -          online
node1     0d       fc         initiator -          -          online
node1     3a       fc         target   -          -          online
node1     3b       fc         target   -          -          online
node1     4a       cna        target   -          -          online
node1     4b       cna        target   -          -          online
node1     6a       fc         target   -          -          online
node1     6b       fc         target   -          -          online
node2     0c       fc         initiator -          -          online
node2     0d       fc         initiator -          -          online
node2     3a       fc         target   -          -          online
node2     3b       fc         target   -          -          online
node2     4a       cna        target   -          -          online
node2     4b       cna        target   -          -          online
node2     6a       cna        target   -          -          online
node2     6b       cna        target   -          -          online
16 entries were displayed.
```

system node image commands

Manage software images

system node image abort-operation

Abort software image 'update' or 'get' operation

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system node image abort-operation` command aborts software installation ("update") or download ("get") operation on the specified node.

Parameters

-node {<nodename>|local} - Node

This specifies the node on which to abort the operation.

Examples

The following example aborts the software installation operation on a node named *node1*.

```
cluster1::> system node image abort-operation -node node1
```

system node image get

Fetch a file from a URL

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command fetches a file from the specified URL and stores it in the /mroot/etc/software directory.

Parameters

[-node {<nodename>|local}] - Node

This parameter specifies the node that fetches and stores the package.

-package <text> - Package URL

This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP, FTP and FILE, are accepted. The FILE URL scheme can be used to specify the location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as *file://usb0/<filename>*. Typically, the file name is *image.tgz*. The package must be present in the root directory of the USB mass storage device.

[-replace-package [true]] - Replace the Local File

Specifies whether an existing package is deleted and replaced with a new package. If you enter this command without using this parameter, its effective value is false and an existing package is not replaced with the new one. If you enter this parameter without a value, it is set to true and an existing package is replaced with the new one.

[-rename-package <text>] - Rename the File

Use this parameter to enter a package name that is different than the file name in the URL.

[-background [true]] - Run in the background

This parameter allows the operation to run in the background. The progress of the operation can be checked with the command `system image show-update-progress`. If this command is entered without using this parameter, its effective value is false and the operation runs in the foreground. If this parameter is used without a value, it is set to true.

Examples

```
system image get http://example.com/image.tgz -rename-package image2.tgz -replace-package
```

system node image modify

Modify software image configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system node image modify` command sets the default software image on a specified node. The default software image is the image that is run when the node is started. A node holds two software images; when you set one as the default image, the other image is automatically unset as the default. Conversely, if you unset a software image as the default, the other image is automatically set as the default.

Parameters

-node {<nodename>|local} - Node

This specifies the node on which the software image is located.

-image {image1|image2|remote} - Image Name

This specifies the software image that is to be set or unset as the default.

[-isdefault {true|false}] - Is Default Image

This optionally specifies whether the specified image is the default.

Examples

The following example sets the software image named image2 as the default image on a node named node0.

```
node::> system node image modify -node node0 -image image2 -isdefault true
Default Image Changed.
```

system node image show

Display software image information

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system node image show` command displays information about software images. By default, the command displays the following information:

- Node name
- Image name
- Whether the image is the default image
- Whether the image is the current image
- Software version
- Installation date

To display detailed information about a specific software image, run the command with the `-node` and `-image` parameters. The detailed view adds information about the kernel image path, and the root file system image path.

You can specify additional parameters to select specific information. For example, to display information only about software images that are currently running, run the command with the `-iscurrent true` parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects information about the software images on the specified node. If this parameter and the `-image` parameter are both used, the command displays detailed information about the specified software image.

[-image {image1|image2|remote}] - Image Name

Selects information about the software images that match the specified name. If this parameter and the `-node` parameter are specified, the command displays detailed information about the specified software image.

[-isdefault {true|false}] - Is Default Image

Selects information about the software images with the specified default setting.

[-iscurrent {true|false}] - Is Current Image

Selects information about the software images that have the specified currency value.

[-kernel-path <text>] - Kernel Image Path

Selects information about the software images that have the specified kernel image path.

[-rootfs-path <text>] - Root Filesystem Image Path

Selects information about the software images that have the specified root file system image path.

[-version <text>] - Software Version

Selects information about the software images that have the specified root file system image path.

[-installdate <MM/DD/YYYY HH:MM:SS>] - Install Date

Selects information about the software image that have the specified installation date. Specify the date in the format MM/DD/YYYY HH:MM:SS [+ HH:MM].

Examples

The following example displays information about the software images on a node named node1:

```
cluster1::> system node image show -node node1
           Is      Is      Install
Node  Image Default Current Version  Date
-----
node1
      image1 true      true      8.0      8/20/2009 17:42:42
      image2 false     false     8.0      6/26/2009 17:44:50
2 entries were displayed.
```

system node image show-update-progress

Show progress information for a currently running update

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system node image show-update-progress` command displays the progress of a software-image update initiated by using the “[system node image update](#)” on [page 1210](#) command. The command displays progress until the update completes; you can also interrupt it by pressing Ctrl-C.

Parameters**-node {<nodename>|local} - Node**

This optionally specifies the name of a node whose image-update progress is to be displayed.

[-follow [true]] - Follow the Progress in the Foreground

Do use not use background processing for this command. If you do not use this parameter, the value is *true*.

Examples

The following example displays image-update progress:

```
node::> system node image show-update-progress

ERROR: command failed: There is no update/install in progress
```

system node image update

Perform software image upgrade/downgrade

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system node image update` command downloads the software image from a specified location and updates the alternate software image (that is, the image that is not currently running on the node). By default, validation of the software image is not performed. Use the `"-validate-only"` parameter to validate the software image first, before performing the update on the cluster nodes.

At the advanced privilege level, you can specify whether to disable version-compatibility checking.

Parameters

-node {<nodename>|local} - Node

This specifies the node on which the software image is located.

-package <text> - Package URL

This specifies the location from which the software image is to be downloaded. The location can be specified in any of the following ways:

- As an HTTP URL in the form `http://host_name[:port]/path_to_file`. For instance, `http://example.com/downloads/image.tgz`. The management utility prompts you for a user name and password before beginning the download.

Note: If you use HTTP to transfer software images, be aware that the management utility does not check whether the Web server is password protected; if it is not, press Enter at the prompt for user name and password.

- As an FTP URL in the form `ftp://host_name[:port]/path_to_file`. For instance, `ftp://example.com/downloads/image.tgz`. If required, the management utility prompts you for a user name and password before beginning the download.
- As a filename of a package left behind by a previous installation, or a package fetched using [“system node image get” on page 1208](#). For example, `image.tgz`. Available packages can be displayed using [“system node image package show” on page 1212](#).
- As a path to a package in a mounted file system in the form `file://localhost/path_to_file`. For example, `file://localhost/mroot/etc/software/image.tgz`.
- The FILE URL scheme can be used to specify the location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as `file://usb0/<filename>`. Typically, the file name is `image.tgz`. The package must be present in the root directory of the USB mass storage device.

[-replace {image1|image2}] - Image to Replace

This optionally specifies the image that is to be replaced when the node is booted from the network.

[-setdefault [true]] - Set Newly Updated Image as Default

This optionally specifies whether to set the newly updated image as the default image (that is, the image that runs the next time the node is restarted). Note that for this parameter to work correctly, the cluster must be in quorum when the image is updated.

[-replace-package [true]] - Replace the Local File

Specifies whether an existing package is deleted and replaced with a new package. If this command is entered without using this parameter, its effective value is false and an existing package is not replaced with the new one. If this parameter is used without a value, it is set to true and an existing package is replaced with the new one.

[-rename-package <text>] - Rename the File

Use this parameter to enter a package name that is different than the file name in the URL.

[-background [true]] - Run in the Background

This parameter will allow the operation to run in the background. The progress of the operation can be checked with the command [“system node image show-update-progress” on page 1210](#). If this

command is entered without using this parameter, its effective value is false and the operation will run in the foreground. If this parameter is used without a value, it is set to true.

[-validate-only *[true]*] - Validate the Package before Installation

Use this parameter to validate the package. Validation consists of verifying whether there is enough space on the system to install the package, verifying the checksum for each component within the package and so on. Validation usually takes from 30 to 60 minutes. If you specify this parameter, the package will be validated only, not installed.

Examples

The following example updates the software image on a node named node0 from a software package located at ftp://ftp.example.com/downloads/image.tgz:

```
node::> system node image update -node node0 -package ftp://ftp.example.com/downloads/image.tgz -setdefault true
```

system node image package commands

The package directory

system node image package delete

Delete a software package

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The delete command will delete the specified software package.

Parameters

-node {<nodename>|local} - Node

The package will be deleted from the repository belonging to the node specified with this parameter. The local node is used as the default if this parameter is omitted.

-package <text> - Package File Name

This parameter specifies the package to be deleted.

Examples

```
::> system image package delete image.tgz
1 entry was deleted.
```

system node image package show

Display software package information

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The package show command displays details of the software packages residing on the storage controller.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects which node's packages are displayed. The local node is the default if this parameter is omitted.

[-package <text>] - Package File Name

This parameter specifies which package's information will be displayed.

Examples

```
cluster1::> system image package show
  Package
Node Repository Package File Name
-----
node-01
  mroot
           image.tgz
1 entries were displayed.
```

system node image package external-device commands

The external-device directory

system node image package external-device delete

Delete file on external device

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The delete command deletes the specified file on the external device.

Parameters**-node {<nodename>|local} - Node**

The file is deleted from the external device of the node specified with this parameter. If this parameter is omitted, then the local node is used as the default node.

-package <text> - File Name

This parameter specifies the file to be deleted.

-device {usb0|usb1} - Device

This parameter specifies the name of the external device. Currently, only usb0 is supported.

Examples

```
::> system image package external delete -package image.tgz
```

system node image package external-device show

Display file listing on external device

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The external-device show command displays files residing on the external storage device.

Parameters**{ [-fields <fieldname>, ...]**

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

This parameter selects the node that has files that are to be displayed on the external storage device. If this parameter is omitted, then the local node is the default node.

[-package <text>] - File Name

This parameter specifies the file for which the information is displayed.

[-device {usb0|usb1}] - Device

This parameter specifies the name of the external device. Currently, only `usb0` is supported.

Examples

```
cluster1::> system image package external-device show
Node           Device      Package File Name
-----
node-01        usb0        image.tgz
node-01        usb0        netboot.tgz
2 entries were displayed.
```

system node internal-switch commands

Manage onboard switches

system node internal-switch show

Display onboard switch attributes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node internal-switch show` command is used to display the internal switch state information and the link status.

Parameters

{ [-fields <fieldname>, ...]}

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Use this parameter to specify the node the switch resides on.

[-switch-id <integer>] - Switch

Use this parameter to specify the switch id. For example, 1.

[-port-id <integer>] - Port

Use this parameter to specify the port id. For example, 0.

[-port-name <text>] - Port Name

Use this parameter to specify the port name. For example, `e0M`.

[-auto-admin <Auto-negotiation setting>] - Auto-Negotiation Administrative

Use this parameter to show the auto-negotiation administrative setting. `'enable'` or `'disable'`.

[-auto-op <Auto-negotiation setting>] - Auto-Negotiation Operational

Use this parameter to show the auto-negotiation operational setting. 'unknown', 'complete', 'incomplete', 'failed' or 'disabled'.

[-duplex-admin <Duplex>] - Duplex Mode Administrative

Use this parameter to show the duplex mode administrative setting. 'half' or 'full'.

[-duplex-op <Duplex>] - Duplex Mode Operational

Use this parameter to show the duplex mode operational setting. 'half' or 'full'.

[-speed-admin <Link speed>] - Speed Administrative

Use this parameter to show the speed administrative setting. '10', '100' or '1000'.

[-speed-op <Link speed>] - Speed Operational

Use this parameter to show the speed operational setting. '10', '100' or '1000'.

[-link <Link Status>] - Link State

Use this parameter to show the link state, 'up' or 'down'.

[-up-admin <Link Status>] - Up Administrative

Use this parameter to show the up administrative setting, 'up' or 'down'.

[-fc-op <Flow control>] - Flow Control Operational

Use this parameter to show the flow control operational setting, 'full', 'send', 'receive' or 'none'.

Examples

The example shows the attributes of the internal switch 0 on the node Node1.

```
cluster1::> system node internal-switch show -node Node1 -switch-id 0
```

Port	Role	Link	Auto-Negot Admin/Oper	Duplex Admin/Oper	Speed(Mbps) Admin/Oper
Node: Node1, Switch: 0					
0	sw-wrench	up	enable/complete	full/full	1000/1000
1	sw-locked-wrench	down	enable/incomplete	full/half	100/10
2	sw-e0M	up	enable/complete	full/full	1000/1000
3	sw-e0P	down	enable/incomplete	full/half	100/10
4	sw-midplane-1	down	enable/incomplete	full/half	100/10
5	sw-expander-1	up	enable/unknown	full/full	100/100
6	sw-sp-1	up	enable/unknown	full/full	100/100

7 entries were displayed.

system node internal-switch dump commands

Dump onboard switch info

system node internal-switch dump stat

Display onboard switch port statistics counter

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node internal-switch dump stat` command is used to display the counter information of the internal switch ports.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node

Use this parameter to specify the node the switch resides on.

[-switch-id <integer>] - Switch

Use this parameter to specify the switch id. For example, 1.

[-port-id <integer>] - Port

Use this parameter to specify the port id. For example, 0.

[-stat-id <text>] - Counter Name

Use this parameter to specify the counter name.

[-valued <integer>] - Counter Value

Use this parameter to show the value of specified counter.

[-port-name <text>] - Port Name

Use this parameter to specify the port name. For example, e0M.

Examples

The following example shows partial counter information of the internal switch 0 on Node1

```
cluster1::> system node internal-switch dump stat -node Node1 -switch-id 0
Port  Port Name      Counter      Value
-----
Node: Node1      , Switch: 0
0      sw-wrench      1024ToMaxOctets  22480201
0      sw-wrench      128To255Octets  119552
0      sw-wrench      256To511Octets  345587
0      sw-wrench      512To1023Octets 1250437
0      sw-wrench      640Octets       803025
```

system node nfs commands

The nfs directory

system node nfs usage commands

Manage node usage settings

system node nfs usage show

Show NFS usage in the local node

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system node nfs usage show` command displays the NFS usage information in the local node. The display output shows the number of RPC calls received per protocol on the local node. Usage is collected whenever there is any NFS traffic. These values are not persistent and will reset when the node reboots. This command is used in conjunction with the `system node nfs usage reset` command in the NFS licensing callback.

Examples

The following example displays the NFS usage information that does not have any NFS usage.

```
::*> system node nfs usage show
Node: raghasri-vsims
v3: 0
v4: 0
```

The following example displays the NFS usage information with v3 usage.

```
::*> system node nfs usage show
Node: raghasri-vsim5
v3: 5
v4: 0
```

The following example displays the NFS usage information with v4 usage.

```
::*> system node nfs usage show
Node: raghasri-vsim5
v3: 0
v4: 14
```

system node power commands

The power directory

system node power on

Power nodes on

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command switches on the power of the main controller of the specified node. This command works for a single node only and the full name of the node must be entered exactly.

Parameters

-node {<nodename>|local} - Node

This parameter specifies the node whose power you want to switch on.

Examples

The following example switches on the power of node2.

```
cluster1:: set advanced

Warning: These advanced commands are potentially dangerous; use them only when
        directed to do so by NetApp personnel.
Do you want to continue? [y|n]: y

cluster1:*
cluster1:* system node power on -node node2

cluster1:*
```

system node power show

Display the current power status of the nodes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the power status of the main controller in each node across the cluster.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

This optional parameter specifies the name of a node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

[-status {on|off}] - Current Power Status

If the `-status` parameter is specified, the command only lists information about the node with the power status value you enter.

Examples

The following example displays power status of all the nodes in cluster1.

```
cluster1::> system node power show
```

Node	Status
node1	on
node2	on

2 entries were displayed.

```
cluster1::>
```

system node root-mount commands

The root-mount directory

system node root-mount create

Create a mount from one node to another node's root volume.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node root-mount create` command produces a root-mount from one node in the cluster to another node's root volume. The root-mount is marked for immediate creation by a background task. Use the [“system node root-mount show” on page 1219](#) command to view the current status of root-mount or verify task completion.

Parameters

-node <nodename> - Owner of the Root-mount

The node name where the root-mount will be created.

-root-node <nodename> - Root-mount Destination Node

The node name that the root-mount will access.

Examples

The following example shows the creation of a root-mount from `cluster1::nodeA` to `cluster1::nodeB` and the verification of the successful completion.

```
cluster1::> system node root-mount show
This table is currently empty.
```

```
cluster1::> system node root-mount create -node nodeA -root-node nodeB
```

```
cluster1::> system node root-mount show
Node      Root Node      State      Last Error
-----
nodeA     nodeB            ready
```

system node root-mount delete

Delete a mount from one node to another node's root volume.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node root-mount delete` command removes a root-mount from one node in the cluster to another node's root volume. The root-mount is marked for immediate deletion by a background task. Use the [“system node root-mount show” on page 1219](#) command to view the current status of root-mount or verify task completion.

Parameters

-node <nodename> - Owner of the Root-mount

The node which has the mount.

-root-node <nodename> - Root-mount Destination Node

The node accessed by the mount.

Examples

This example shows the deletion of a root-mount from *cluster1::nodeA* to *cluster1::nodeB* and the verification of the command's successful completion.

```
cluster1::> system node root-mount show
Node      Root Node      State      Last Error
-----
nodeA     NodeB            ready

cluster1::> system node root-mount delete -node nodeA -root-node nodeB

cluster1::> system node root-mount show
This table is currently empty.
```

system node root-mount show

Show the existing mounts from any node to another node's root volume.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node root-mount show` command displays the status of current root-mounts from any node to another node's root volume. These root-mounts are used by cluster services to access data on other nodes in the cluster. These root-mounts are not pre-created, but are created as they are needed. They can also be manually created or deleted.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node <nodename>] - Owner of the Root-mount

Selects information about root-mounts that exist on the specified node.

[-root-node <nodename>] - Root-mount Destination Node

Selects information about root-mounts that connect to the specified node.

[-create-time <MM/DD/YYYY HH:MM:SS>] - Mount Creation Time

Selects information about root-mounts that were created at the specified time.

[-state <Mount State>] - State of the Root-Mount

Selects information about root-mounts that have the specified state. The states are:

- *unknown*: The state of the root-mount is being determined.
- *initializing*: A root-mount was found and needstesting to determine the correct state.
- *mount-requested*: The root-mount has been requested, but is not ready.
- *mounting*: The root-mount is being created, but is not ready.
- *ready*: The root-mount is ready to be used.
- *not-responding*: The root-mount exists but is not responding.
- *does-not-exist*: No root-mount is possible to this node's root volume.
- *ha-busy*: The root-mount is busy pending completion of an HA event.
- *clean-up-requested*: The root-mount is being deleted.
- *cleaning-up*: The root-mount is being deleted.
- *create-error*: The root-mount could not be created.

[-last-error <text>] - Last Error

Selects information about root-mounts that have the specified last-error value.

Examples

The following example shows the default state of the root-mounts on a cluster that is not using root-node services:

```
cluster1::> system node root-mount show
This table is currently empty.
```

The following example displays the root-mounts that exist for a cluster that has *nodeA* mounted to *nodeB*, and *nodeB* mounted to *nodeA*:

```
cluster1::> system node root-mount show
```

Node	Root Node	State	Last Error
nodeA	nodeB	ready	
nodeB	nodeA	ready	

2 entries were displayed.

system node upgrade-revert commands

The upgrade-revert directory

system node upgrade-revert show

Display upgrade/revert node status.

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system node upgrade-revert show` command displays information about the status of upgrades or reversions. If an upgrade has failed, this command enables you to determine which phase of the upgrade contains the failed upgrade task and the reason for the failure.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Use this parameter to display status information only about upgrades or reversions that are slated to occur on the nodes you specify.

[-upgrade-version <integer>] - Cluster Upgrade Version

Selects status information about upgrades or reversions that are to the version number you specify.

[-startup-phase {pre-root|pre-apps|post-apps}] - Startup Phase

Selects status information about upgrades or reversions that are slated to occur during the startup phase you specify. Startup phases are:

- `pre-root` - Upgrade is applied before `mroot` is mounted
- `pre-apps` - Upgrade is applied before other cluster apps are started
- `post-apps` - Upgrade is applied after all RDB apps are online

[-status <Upgrade/Revert Execution Status>] - Execution Status

Selects status information about upgrades or reversions that have the execution status you specify. Execution statuses are:

- `prepared` - Ready to upgrade
- `applied` - Successful upgrade
- `reverted` - Successful reversion
- `failed` - Unsuccessful upgrade or reversion
- `aborted` - Unsuccessful upgrade or reversion
- `skipped` - Upgrade or reversion was skipped for that phase
- `locked` - Upgrading or reverting

[-status-msg <text>] - Status Message

Selects status information about upgrades or reversions that have the status message you specify. The status message displays the current status of the phase with which it appears.

[-direction {upgrade|revert}] - Upgrade/Revert Direction

Use this parameter with the value `upgrade` to select status information about upgrades. Use this parameter with the value `revert` to select status information about reversions.

[-node-status {reverting|complete|not-needed|aborted|failed|waiting|in-progress|stopped}] - Node Status

Selects status information about upgrades or reversions that have the status you specify on nodes where they are slated to occur. Node statuses are:

- `aborted` - Upgrade process aborted. Contact support personnel.
- `failed` - Upgrade process failed. Contact support personnel.
- `stopped` - Upgrade process stopped due to node or management application restart. Use the [“system node upgrade-revert upgrade” on page 1222](#) command to complete the upgrade manually.
- `complete` - Upgrade process completed successfully.
- `waiting` - Upgrade process is waiting the replication database to come online or for applications to be stable. If the RDB is not online, check network connectivity using [“cluster show” on page 57](#) and [“cluster ping-cluster” on page 51](#) to ensure that all nodes are healthy and in communication.

[-node-status-msg <text>] - Node Status Message

Selects status information about upgrades or reversions that have the node status message you specify. The node status message displays the upgrade or reversion status of the node with which it appears. If the upgrade or reversion fails, this message provides information that helps to diagnose the cause of the failure.

Examples

The following example shows typical output for a cluster with two nodes. Status messages for each phase display information about the tasks in that phase.

```
cluster1::*> system node upgrade-revert show
```

```
Node: node1                                Status: complete
```

```
Status Message: The upgrade is complete.
```

Vers	Phase	Status	Upgrade Phase Status Message
200	pre-root	applied	No upgrade is required for this phase.
200	pre-apps	applied	Upgrade successful.
200	post-apps	applied	Upgrade successful.

```
Node: node2                                Status: complete
```

```
Status Message: The upgrade is complete.
```

Vers	Phase	Status	Upgrade Phase Status Message
200	pre-root	applied	No upgrade is required for this phase.
200	pre-apps	applied	Upgrade successful.
200	post-apps	applied	Upgrade successful.

6 entries were displayed.

system node upgrade-revert upgrade

Run the upgrade at a specific phase.

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system node upgrade-revert upgrade` command manually executes an upgrade. Use this command to execute an upgrade after issues that caused an upgrade failure are resolved. If the upgrade is successful, no messages display.

Before the command executes upgrades, it checks the configuration of the nodes in the cluster. If no upgrades are needed, the command displays a message and does not execute any upgrades.

Parameters

-node {<nodename>|local} - Node

Specifies the node that is to be upgraded. The value `local` specifies the current node.

Examples

This example shows command output of a node named `node0` if node configuration is current.

```
cluster1::*> system node upgrade-revert upgrade -node node0
The node configuration is up-to-date. No upgrade is needed.
```

system node virtual-machine commands

Configure Data ONTAP virtual machine settings

The `system node virtual-machine` commands enable virtual machine and hypervisor management.

system node virtual-machine hypervisor commands

View and configure hypervisor information

The `system node virtual-machine hypervisor` commands enable you to view and manage information about the hypervisor on which Data ONTAP resides.

system node virtual-machine hypervisor modify-credentials

Modify hypervisor IP address and its credentials

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node virtual-machine hypervisor modify-credentials` command is used to set the *IP address* of the hypervisor on which the node is running or vSphere credentials (i.e. `-new-username` or `-new-password`).

Parameters

-node {<nodename>|local} - Node

Name of the Data ONTAP node running in a virtual machine. It is a required field and the node must exist in the cluster.

[-new-server <text>] - New Hypervisor IP Address

New vSphere server controlling this virtual machine. It can be either an IP address or (if name resolution is enabled) a hostname.

[-new-username <text>] - New Hypervisor Username

New vSphere username for the `-new-server` specified above.

[-new-password <text>] - New Hypervisor Password

New vSphere password for the `-new-server` specified above.

Examples

The following example sets the IP address and the credentials of the vSphere server on which the node is running.

```
cluster1::> system node virtual-machine hypervisor modify-credentials
-node node1 -new-server 192.168.0.1 -new-username admin -new-password pass123
```

system node virtual-machine hypervisor show

Display hypervisor information about Data ONTAP-v nodes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node virtual-machine hypervisor show` command displays information for each hypervisor that is hosting a Data ONTAP virtual machine. The output contains the hypervisor-specific information, such as host name and IP address, as well as network configuration details. The command only scans hypervisors on which Data ONTAP virtual machines are installed. To filter command output, specify any number of optional fields listed below.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-node <nodename>|local`]] - Node

The name of the Data ONTAP node running in a virtual machine for which information is to be displayed. If this optional parameter is not specified, the command displays information about all nodes in the cluster.

[`-vm-uuid <UUID>`]] - UUID of the Virtual Machine

The hypervisor-supplied unique ID for this virtual machine. This optional parameter selects information about the hypervisor on which the Data ONTAP virtual machine is running with the specified UUID. Since UUID is unique per host, an alternative and easier way is to use `-node` to filter out the same information.

[`-vmhost-bios-release-date <text>`]] - Release Date for the Hypervisor BIOS

The release date for the currently running hypervisor BIOS. This optional parameter selects information about the hypervisors that have the specified BIOS release date.

[`-vmhost-bios-version <text>`]] - Current BIOS Version of the Hypervisor Physical Chassis

The current BIOS version of the hypervisor physical chassis. This optional parameter selects information about the hypervisors that are running with the specified BIOS version.

[`-vmhost-boot-time <text>`]] - Time When Hypervisor was Last Booted

The time when the hypervisor was last booted. This optional parameter selects information about the hypervisors which were last booted at the specified boot time.

[`-vmhost-cpu-clock-rate <integer>`]] - Speed of the Hypervisor CPU Cores (MHz)

The speed of the hypervisor CPU cores. This optional parameter selects information about the hypervisors that are running with the specified CPU clock rate.

[`-vmhost-cpu-core-count <integer>`]] - Number of Physical CPU Cores on the Hypervisor

The number of physical CPU cores on the hypervisor. Physical CPU cores are the processors contained by a CPU package. This optional parameter selects information about the hypervisors that are running with the specified CPU cores.

[`-vmhost-cpu-socket-count <integer>`]] - Number of Physical CPU Packages on the Hypervisor

The number of physical CPU packages on the hypervisor. Physical CPU packages are chips that contain one or more processors. Processors contained by a package are also known as CPU cores. For example, one dual-core package is comprised of one chip that contains two CPU cores. This optional parameter selects information about the hypervisors that are running with the specified CPU sockets.

[`-vmhost-cpu-thread-count <integer>`]] - Number of Physical CPU Threads on the Hypervisor

The number of physical CPU threads on the hypervisor. This optional parameter selects information about the hypervisors that are running with the specified CPU threads.

[`-vmhost-gateway <text>`]] - Default Gateway for the Hypervisor

The default gateway for the hypervisor. This optional parameter selects information about the hypervisors with the specified gateway address.

[`-vmhost-hardware-vendor <text>`]] - Hardware Vendor of the Hypervisor

The name of hypervisor hardware manufacturer. This optional parameter selects information about the hypervisors with the specified hardware vendor.

[`-vmhost-hypervisor <text>`]] - Complete Product Name, including the Version Information for the Hypervisor

The complete product name, including the version information for the hypervisor. This optional parameter selects information about the hypervisors that are running with the specified hypervisor version.

[`-vmhost-ip-address <text>`]] - Primary IP Address Assigned to the Hypervisor

The primary IP address assigned to the hypervisor. This optional parameter selects information about the hypervisors with the specified IP address.

[-vmhost-memory <integer>] - Physical Memory Size of the Hypervisor (Bytes)

The physical memory size of the hypervisor in bytes. This optional parameter selects information about the hypervisors that are running with the specified physical memory.

[-vmhost-model <text>] - Hypervisor Manufacturer-Supplied Hardware Model Name

The hypervisor manufacturer-supplied hardware model name. This optional parameter selects information about the hypervisors with the specified hardware model.

[-vmhost-name <text>] - Hostname of the Hypervisor

The host name assigned to the hypervisor. This optional parameter selects information about the hypervisor with the specified host name.

[-vmhost-netmask <text>] - Subnet Mask Address for the Hypervisor

The subnet mask address for the hypervisor. This optional parameter selects information about the hypervisors with the specified netmask address.

[-vmhost-processor-id <text>] - Processor ID of the Hypervisor

The processor ID of the hypervisor. This optional parameter selects information about the hypervisors with the specified processor ID.

[-vmhost-processor-type <text>] - CPU Model of the Hypervisor

The CPU model of the hypervisor. This optional parameter selects information about the hypervisors that are running with the specified processor type.

[-vmhost-software-vendor <text>] - Name of the Virtual Machine Software Manufacturer

The name of the virtual machine software manufacturer. This optional parameter selects information about the hypervisors with the specified software vendor.

[-vmhost-uuid <UUID>] - UUID of the Hypervisor

A unique ID for the hypervisor. This optional parameter selects information about the hypervisor with the specified UUID.

[-vmhost-error <text>] - Error in case Hypervisor Info Retrieval Fails

Displays a list of nodes on which the hypervisor has received the specified error. This parameter is most useful when entered with wildcards.

[-vm-custom-max-capacity <integer>] - Maximum Storage Capacity of the Virtual Machine (in TB)

The maximum system capacity (in TB) that can be configured on the VM. This optional parameter selects information about the node's storage capacity.

Examples

The following example shows typical output from the `system node virtual-machine hypervisor show` command for the Data ONTAP virtual machines running in the cluster.

```
cluster1::> system node virtual-machine hypervisor show

system node virtual-machine hypervisor show-credentials

Display hypervisor IP address and its credentials

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node virtual-machine hypervisor show-credentials` command displays the current vSphere authentication information (except the password). This consists of the vSphere server and username. The vSphere password is not displayed for security reasons. vSphere authentication information is required to use ([“system node virtual-machine hypervisor show” on page 1223](#) -node <node>, [“system node virtual-machine instance show-system-disks” on page 1229](#) -node <node> and storage disk show -virtual-machine-disk-info -node <node>) to be able to gather information about the physical host machine. It also attempts to verify the current vSphere authentication information with the vSphere host. If the check succeeds and the credentials are correct, the command displays the following information. If you want to see details about a single node, use the -node parameter.

- Node
- Hypervisor name or IP Address
- vSphere Username
- Credentials Correct?: *true*

If the check fails or credentials are incorrect, the command displays an additional *Error*.

- Node
- Hypervisor name or IP Address
- vSphere Username
- Credentials Correct?: *false*
- Error:

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|/local}] - Node

This optional parameter represents the name of the Data ONTAP node running in a virtual machine for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

[-server <text>] - Hypervisor IP Address or Hostname

Use this parameter to only display the Data ONTAP nodes in the cluster whose vSphere server matches this value.

[-username <text>] - Hypervisor Username

Use this parameter to only display the Data ONTAP nodes in the cluster whose vSphere username matches this value.

[-are-credentials-correct {true|false}] - Credentials Correct?

Get a list of Data ONTAP nodes running with either incorrect (false) or correct (true) vSphere credentials.

[-error <text>] - Error

Get a list of nodes with the specified error. This parameter is most useful when entered with wildcards.

Examples

The following example shows the vSphere server and vSphere username. It also displays whether the server address or its credentials are correct and displays an error if they are not.

```
cluster1::> system node virtual-machine hypervisor show-credentials
      Node: node1
Hypervisor IP Address: 192.168.0.1
      vSphere Username: administrator
      Credentials Correct?: true

      Node: node2
Hypervisor IP Address:
      vSphere Username: admin
      Credentials Correct?: false
Error: [13166] could not find IP addr for host.
Correct the vSphere credentials with the
"system node virtual-machine hypervisor modify-credentials -node" command.

2 entries were displayed.
```

system node virtual-machine instance commands

View virtual machine instance information

The `system node virtual-machine instance` commands enable virtual machine instance management.

system node virtual-machine instance show

Display virtual machine instance information per node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node virtual-machine instance show` command displays virtual machine information. With this information you can determine the relationship between a Data ONTAP *node* and its associated virtual machine instance running within a cloud provider. Several other details about the virtual machine can be extracted as well, such as the cloud provider account ID to which it belongs. To filter command output, specify any number of optional fields listed below.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

This optional parameter represents the name of the Data ONTAP node running in a virtual machine for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

[-instance-id <text>] - ID of This Instance

A cloud provider-supplied unique instance ID for this virtual machine, for example "i-a9d42f89" or "db00a7755a5e4e8a8fe4b19bc3b330c3.1".

[-account-id <text>] - ID of This Account

The cloud provider-associated account ID for this virtual machine. This parameter is usually associated with a cloud provider login ID and password.

[-image-id <text>] - ID Of the Image in Use on This Instance

The image ID installed on this virtual machine instance. It identifies a pre-defined template of a computing device's software environment. It contains the operating system and can also include application software, such as database servers, middleware, and web servers. In this case, the ID refers to an image that contains everything required to run Data ONTAP in the cloud.

[-instance-type <text>] - Specifies System Attributes and Use Cost

A specification (as defined by the cloud provider) that defines the memory, CPU, storage capacity and usage cost for a virtual machine instance. Some instance types are designed for standard applications, whereas others are designed for CPU-intensive or memory-intensive applications and so on.

[-region <text>] - Set of Resources in the Same Geographic Area

A named set of resources in the same geographical area. For example "us-east-1" might be the name for a collection of compute and storage resources on the eastern coast of the United States. Typically, a region contains multiple availability zones.

[-version <text>] - Version of This VM Instance Information

The version of the Instance Metadata or Agent Wire Protocol as defined by the cloud provider.

[-availability-zone <text>] - Distinct Location within a Region

A distinct location within a *region* that is insulated from failures in other availability zones. It provides low-latency network connectivity to other availability zones in the same region.

[-primary-ip <text>] - Primary IP Address Assigned to this Instance

The primary IP address assigned to this virtual machine instance.

[-deployment-id <text>] - Deployment ID of This Instance

A cloud provider-supplied unique deployment ID for this virtual machine, for example "2831c724-97ca-4395-b8d3-a65c2a65b502".

[-fault-domain <integer>] - Fault Domain of This Instance

A cloud provider-assigned numerical fault domain ID for this virtual machine within an Availability Set.

[-update-domain <integer>] - Update Domain of This Instance

A cloud provider-assigned numerical update domain ID for this virtual machine within an Availability Set.

[-provider <text>] - Provider on which this instance is running.

The provider on which this instance is running.

Examples

The following examples illustrate typical output from the `system node virtual-machine instance show` command for a virtual machine running in a cloud provider environment.

```
cluster1::> system node virtual-machine instance show
```

```
Node: node1
Instance ID: i-b9c42e97
Account ID: 751083215869
Image ID: ami-7fb4a1c6
Instance Type: m3.xlarge
Region: us-east-1
Version: 2010-08-31
Availability Zone: us-east-1d
Primary IP: 192.168.0.1
Provider: AWS
```

```
cluster1::> system node virtual-machine instance show
```

```
Node: node1
Instance ID: 2831c724-97ca-4395-b8d3-a65c2a65b502_cloudontap-vm
Deployment ID: 2831c724-97ca-4395-b8d3-a65c2a65b502
Version: 2012-11-30
Availability Set: Fault Domain: 0
Update Domain: 0
Primary IP: 192.168.0.1
Provider: Azure
```

system node virtual-machine instance show-system-disks

Display information about Data ONTAP-v system disks

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node virtual-machine instance show-system-disks` command displays the system disks information of the Data ONTAP node running on the virtual machine. There are three types of Data ONTAP-v system disks - boot, core and log. The details contain the physical properties of the disk and its backing information (e.g. backing store name, iSCSI Lun UUID, etc). To filter command output, specify any number of optional fields listed below.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node Name

The name of the Data ONTAP node running in a virtual machine for which information is to be displayed. If this optional parameter is not specified, the command displays information about all nodes in the cluster.

[-vmdisk-type <text>] - Type of the System Disk

The type of the system disk, for example "Boot", "Core" or "Log". This optional parameter selects the information about the system disk with the specified type.

[-vmdisk-name <text>] - Data ONTAP Supplied Name of the System Disk

The Data ONTAP-supplied name of the system disk. This optional parameter selects the information about the system disk with the specified name.

[-vmdisk-serial-number <text>] - Data ONTAP Supplied Serial Number of the System Disk

The Data ONTAP-supplied serial number of the system disk. This optional parameter selects the information about system disk with the specified serial number.

[-vmdisk-capacity {<integer>[KB|MB|GB|TB|PB]] - Size of the System Disk

The size of the system disk. This optional parameter selects the information about system disks with the specified size.

[-vmdisk-area-name <text>] - Name of the System Disk Backing Store

The name of the disk backing store. A backing store represents a storage location for virtual machine files. It can be a VMFS volume, a directory on network-attached storage, or a local file system path. This optional parameter selects the information about the system disks that reside on the specified backing store.

[-vmdisk-file-name <text>] - File Name of the System Disk Used By the Hypervisor

The file name of the virtual disk used by the hypervisor. Each Data ONTAP disk is mapped to a unique VM disk file. This optional parameter selects the information about the system disk mapped to the specified file name.

[-vmdisk-backing-store-type <text>] - Type of the System Disk Backing Store

The type of the disk backing store. It can be a VMFS volume, a directory on network-attached storage, or a local file system path. This optional parameter selects the information about the system disks that are backed by the specified type.

[-vmdisk-backing-store-capacity {<integer>[KB|MB|GB|TB|PB]] - Size of the System Disk Backing Store

The size of the disk backing store. This optional parameter selects the information about the system disks that are backed by stores with the specified capacity.

[-vmdisk-backing-store-nas-path <text>] - Full Path to the Backing Store for NAS

The full path to the backing store for network-attached storage. This optional parameter selects the information about the system disks with the specified NAS path.

[-vmdisk-backing-adapter-pci <text>] - Backing Adapter PCI Device ID

The backing adapter PCI device ID for the virtual disk. This optional parameter selects the information about the system disks that have the specified ID as their backing adapter PCI ID.

[-vmdisk-backing-adapter-device <text>] - Name of the Backing Adapter Device

The name of the backing adapter device. This optional parameter selects the information about the system disks that have the specified name as their backing adapter device name.

[-vmdisk-backing-adapter-model <text>] - Type of the Backing Adapter Model

The type of the backing adapter model. This optional parameter selects the information about the system disks that have the specified type as their backing adapter model type.

[-vmdisk-backing-adapter-driver <text>] - Backing Adapter Driver Name of the Initiator

The backing adapter driver name of the initiator. This optional parameter selects the information about the system disks that have the specified name as their initiator's backing adapter driver name.

[-vmdisk-backing-target-iscsi-name <text>] - iSCSI Name of the System Disk Backing Target

The iSCSI name of the disk backing target. This field is valid only for iSCSI connections. This optional parameter selects the information about the system disks that have the specified name as their backing device iSCSI target name.

[-vmdisk-backing-target-iscsi-address <text>] - iSCSI IP Address of the System Disk Backing Target

The iSCSI IP address of the disk backing target. This field is valid only for iSCSI connections. This optional parameter selects the information about the system disks that have the specified IP as their backing device iSCSI target IP address.

[-vmdisk-backing-device-address <text>] - SCSI Device Name (target-id:lun-id) for the Backing Disk

The SCSI device name for the backing disk. It takes the form target-id:lun-id, for example "2:1". This optional parameter selects the information about the system disks that have the specified backing device address.

[-vmdisk-backing-device-uuid <text>] - Hypervisor-Assigned Unique ID of the Backing Device

The hypervisor-assigned unique ID of the backing device (disk or LUN). This optional parameter selects the information about system disks that are backed by a device with the specified UUID.

[-vmdisk-backing-device-partition <integer>] - Backing Disk Partition Number for the VM Disk File

The backing disk partition number where the corresponding VM disk file resides. This optional parameter selects the information about the system disks that reside on the specified partition number on any disk.

[-vmdisk-backing-device-capacity {<integer>[KB|MB|GB|TB|PB]}] - Size of the Backing Device (Disk or LUN)

The size of the backing device (disk or LUN) in bytes. This optional parameter selects the information about the system disks that have backing devices with the specified capacity.

Examples

The following example shows typical output from the `system node virtual-machine instance show-system-disks` command for the Data ONTAP node running on a virtual machine.

```
cluster1::> system node virtual-machine instance show-system-disks
  Disk Disk  Disk   Store
Node Type Name  Capacity Name   VM Disk File Name
-----
node1
  Boot ad0    1.032 GB store1 store1/node1/DataONTAP.vmdk
  Core ad1    1.505 GB store2 store2/node1/DataONTAP-var.vmdk
  Log  ad2    5.001 GB store3 store3/node1/DataONTAP-nvram.vmdk
```

```
Warning: Unable to list entries on node node2. Failed to connect
         to the vSphere server. Reason: Either the server hostname
         or IP address is not set or there are network issues.
         Correct the vSphere credentials using the "system node
         virtual-machine hypervisor modify-credentials" command.
3 entries were displayed.
```

system script commands

Capture CLI session to a file for later upload. Analogous to the unix `'script'` command

system script delete

Delete saved CLI session logs

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system script delete` command deletes files that contain CLI session records. Use the [“system script show” on page 1232](#) command to display saved CLI sessions.

Parameters

-username <text> - Log Owner Username

Use this parameter to specify the name of the user whose CLI session record files are deleted. The default is the username is that of the logged in user.

-filename <text> - Log Filename

Use this parameter to specify the names of CLI session record files to delete.

Examples

The following example shows how to delete the files named `sessionlog2` and `sessionlog3`.

```
cluster1::> system script delete -filename sessionlog2,sessionlog3
```

The following example deletes all saved script files.

```
cluster1::> system script delete *
```

system script show

Display saved CLI session logs

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system script show` command displays information about files that contain records of CLI sessions.

For security reasons, the command normally displays only the script files created by the logged in user. Administrative users can display all log files using the `-user` parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-user]

Use this parameter to display all script files created by all users, along with the username associated with each file.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-username <text>] - Log Owner Username

Use this parameter to display information only about files saved by the user you specify. The default username is that of the logged in user.

[-filename <text>] - Log Filename

Use this parameter to display information only about files that have the file name you specify.

[-size-limit {<integer>[KB|MB|GB|TB|PB]] - Logfile Size Limit

Use this parameter to display information only about files that have the size limit you specify.

[-state <State of CLI session log>] - Current State

Use this parameter to display information only about files that have the state you specify. Valid values for this parameter are `open-and-logging`, `file-full`, and `file-closed`.

[-size {<integer>[KB|MB|GB|TB|PB]] - Current Logfile Size

Use this parameter to display information only about files that are the size you specify.

[-mtime <MM/DD/YYYY HH:MM:SS>] - Last Modification Time

Use this parameter to display information only about files that were last modified at the date and time you specify.

[-this-session {yes|no}] - Session is Logging

Use this parameter with the value `yes` to display information only about files that are recording the current CLI session. Use this parameter with the value `no` to display information only about files that are not recording the current CLI session.

Examples

The following example displays typical system script information.

```
cluster1::> system script show
This
-----
FileName      Sess State      Size  Last Mod Date
-----
sessionlog1    no  file-closed    435B   12/2/2008 10:51:12
sessionlog2    yes open-and-logging 193B   12/2/2008 10:51:29
2 entries were displayed.
```

system script start

Start logging all CLI I/O to session log

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system script start` command starts creating a record of your CLI session. The record is stored in a file. Use the [“system script show” on page 1232](#) `-this-session yes` command to display files that are recording the current CLI session. Use the [“system script stop” on page 1233](#) command to stop recording the current CLI session.

Parameters

-filename <text> - Filename to Log To

Use this parameter to specify the file name to which the CLI session record is saved.

-size-limit {<integer>[KB|MB|GB|TB|PB]} - Logfile Size Limit Max:2GB

Use this parameter to specify the maximum size of the file that contains the CLI session record. When the file size reaches this limit, recording stops. The default file size limit is 1 MB. The maximum file size limit is 2 GB.

Examples

The following example shows how to start creating a record of the CLI session in a file named `sessionlog3`. The size limit of this file is 20 MB.

```
cluster1::> system script start -filename sessionlog3 -size-limit 20MB
```

system script stop

Stops logging CLI I/O

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system script stop` command stops creating a record of your CLI session, if you started creating the record by using the [“system script start” on page 1233](#) command. Use the [“system script show” on page 1232](#) `-this-session yes` command to display files that are recording the current CLI session.

Examples

The following example shows how to stop creating a record of your CLI session.

```
cluster1::> system script stop
```

system script upload

Upload the selected CLI session log

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system script upload` command uploads a CLI session record file to a remote location. Specify the remote location using an FTP or HTTP URI. Use the [“system script show” on page 1232](#) command to display saved CLI sessions. Use the [“system script start” on page 1233](#) command to record a CLI session and save it to a file.

Parameters

-username <text> - Username If Not Your Own

Use this parameter to specify the name of the user who owns the file to upload. By default, this is the user who is logged in.

-filename <text> - Filename to Log To

Use this parameter to specify the name of a file to be uploaded.

-destination {(ftp|http)://(hostname|IPv4 Address|['IPv6 Address'])...} - URI to Send File To

Use this parameter to specify the FTP or HTTP destination of the file.

Examples

The following example shows how to upload the file named `sessionlog3` to the destination `ftp://now.example.com/cli_sessions`.

```
cluster1::> system script upload -filename sessionlog3 -destination ftp://now.example.com/cli_sessions
```

system service-processor commands

Display and configure the Service Processor

system service-processor reboot-sp

Reboot the Service Processor on a node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system service-processor reboot-sp` command reboots the Service Processor of the specified node.

Parameters

-node {<nodename>|local} - Node

This parameter specifies the node whose Service Processor is to be rebooted.

[-image {primary|backup}] - Image to Boot with After Reboot

This parameter specifies the image that the Service Processor uses after the reboot. By default, the primary image is used. Avoid booting the SP from the backup image. Booting from the backup image is reserved for troubleshooting and recovery purposes only. It might require that the SP automatic firmware update be disabled, which is not a recommended setting. You should contact technical support before attempting to boot the SP from the backup image.

Examples

The following command reboots the Service Processor of node "node1" into the primary image.

```
cluster1:: system service-processor reboot-sp -node node1 -image primary
```

NOTE : If your console connection is through the SP, it will be disconnected.
Do you want to reboot the SP ? [y|n]: y

```
cluster1::
```

The following command reboots the Service Processors of all nodes. Since -image is not specified, the Service Processors will boot into the primary image.

```
cluster1:: system service-processor reboot-sp -node *
```

NOTE : If your console connection is through the SP, it will be disconnected.
Do you want to reboot the SP ? [y|n]: y
2 entries were acted on.

```
cluster1::
```

system service-processor show

Display the Service Processor information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system service-processor show` command displays information about the Service Processor of each node in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

In case a node is offline or its Service Processor management daemon is down, the command displays the last known IP address of its Service Processor. Only the IP address is displayed in such cases.

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects information for the Service Processor of the specified node.

[-type {SP|NONE|BMC}] - Type of Device

Selects information for the Service Processors of the specified type.

[-status {online|offline|sp-daemon-offline|node-offline|degraded|rebooting|unknown|updating}] - Status

Selects information for the Service Processors whose status matches the specified value.

[-ip-configured {true|false}] - Is Network Configured

Selects information for the Service Processors whose network is configured (true) or not configured (false).

[-address <IP Address>, ...] - Public IP Address

Selects information for the Service Processors that use the specified IP address or addresses.

[-mac <MAC Address>] - MAC Address

Selects information for the Service Processors that use the specified MAC address.

[-fw-version <text>] - Firmware Version

Selects information for the Service Processors that are running the specified firmware version.

[-part-num <text>] - Part Number

Selects information for the Service Processors that have the specified part number.

[-serial-num <text>] - Serial Number

Selects information for the Service Processors that have the specified serial number.

[-dev-rev <text>] - Device Revision

Selects information for the Service Processors that have the specified device revision.

[-autoupdate-enabled {true|false}] - Is Firmware Autoupdate Enabled

Selects information for the Service Processors that have the specified status for firmware automatic update.

Examples

The following example displays basic information for the Service Processors of all the nodes.

```
cluster1::> system service-processor show
Node      Type Status      IP      Firmware
Configured Version  IP Address
-----
node1     SP  online      true     2.2X5    192.168.1.201
node2     SP  online      true     2.2X5    192.168.1.202
2 entries were displayed.

cluster1::>
```

The following example displays all available information for the Service Processors of all the nodes.

```
cluster1::> system service-processor show -instance

Node: node1
Type of Device: SP
Status: online
Is Network Configured: true
Public IP Address: 192.168.1.201
MAC Address: ab:cd:ef:fe:ed:01
Firmware Version: 2.2X5
Part Number: Not Applicable
Serial Number: Not Applicable
Device Revision: Not Applicable
Is Firmware Autoupdate Enabled: true

Node: node2
Type of Device: SP
Status: online
Is Network Configured: true
Public IP Address: 192.168.1.202
MAC Address: ab:cd:ef:fe:ed:02
Firmware Version: 2.2X5
Part Number: Not Applicable
Serial Number: Not Applicable
Device Revision: Not Applicable
Is Firmware Autoupdate Enabled: true
2 entries were displayed.

cluster1::>
```

The following example displays only the type, status and firmware version for the Service Processors of all the nodes.

```
cluster1::> system service-processor show -fields type,status,fw-version
node      type status fw-version
-----
node1     SP  online 2.2X5
node2     SP  online 2.2X5
2 entries were displayed.

cluster1::>
```

system service-processor api-service commands

Display and configure the Service Processor API service

system service-processor api-service modify

Modify service processor API service configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system service-processor api-service modify` command modifies SP API service configuration. The SP API is a secure network API that enables Data ONTAP to communicate with the Service Processor over the network.

Parameters

[-is-enabled {true|false}] - Is SP API Service Enabled

This parameter enables or disables the API service of the Service Processor. When the API service is disabled, features like network-based firmware updates and network-based down filer log collection will not be available, and the slower serial-interface will be used for firmware updates and down filer log collections.

[-port <integer>] - SP API Service Port

This parameter specifies the port number on the Service Processor used for the API service. By default, port 50000 is used.

Examples

The following example modifies the port number used for the SP API service and then disables the SP API service.

```
cluster1::*>system service-processor api-service modify -port 50001

cluster1::*>system service-processor api-service show
Service Processor API service configuration
is-enabled: true
port: 50001

cluster1::*>system service-processor api-service modify -is-enabled false

cluster1::*>system service-processor api-service show
Service Processor API service configuration
is-enabled: false
port: 50001
```

system service-processor api-service renew-certificates

Renew SSL and SSH certificates used for secure communication with Service Processor API service

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system service-processor api-service renew-certificates` command renews the internal SSL and SSH certificates used for secure communication with the Service Processor API service. If the parameter `-renew-all` is not specified, only host certificates are renewed.

Parameters

[-renew-all {true|false}] - Renew CA Certificates Also

This parameter specifies the type of certificates that needs to be renewed. If this parameter is set to false, only the host certificates (that is, the client and server certificates) are renewed. If this parameter is set to true, the root-ca certificate is renewed along with the host certificates.

Examples

The following example renews the host certificates and the root-ca certificates. The second command renews only the host certificates.

```
cluster1::*>system service-processor api-service renew-certificates -renew-all true
cluster1::*>system service-processor api-service renew-certificates
```

system service-processor api-service show

Display service processor API service configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system service-processor api-service show` command displays the Service Processor API service configuration.

Examples

The following example displays the SP API service configuration:

```
cluster1::*>system service-processor api-service show
  Service Processor API service configuration
is-enabled: true
  port: 50000
```

system service-processor image commands

Service Processor Firmware Image commands

system service-processor image modify

Enable/Disable automatic firmware update

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system service-processor image modify` command enables or disables automatic firmware update on the Service Processor of specified node or nodes.

Parameters

-node {<nodename>|local} - Node

The parameter specifies the node on which automatic Service Processor firmware update is to be enabled or disabled.

[-autoupdate {true|false}] - Firmware Autoupdate

Setting this parameter to `true` enables automatic firmware update. Setting this parameter to `false` disables automatic firmware update. This is a mandatory parameter.

Examples

The following command enables automatic firmware update for the Service Processor on the local node.

```
cluster1::> system service-processor image modify -node local -autoupdate true
```

The following command enables automatic firmware update for the Service Processors on all the nodes.

```
cluster1::> system service-processor image modify -node * -autoupdate true
2 entries were modified.
```

system service-processor image show

Display the details of currently installed Service Processor firmware image

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system service-processor image show` command displays information about the currently installed firmware images on the Service Processor of each node in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

Parameters

[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects firmware image information for the Service Processor of the specified node.

[-image {primary|backup}] - Image

Selects firmware image information for the Service Processors that are running the primary or backup image as specified.

[-type {SP|NONE|BMC}] - Type

Selects firmware image information for the Service Processors of the specified type.

[-status {installed|corrupt|updating|auto-updating|none}] - Image Status

Selects firmware image information for the Service Processors whose image status matches the specified value.

[-is-current {true|false}] - Is Image Current

Selects firmware image information for the SP whose current image matches the specified status. This parameter indicates the partition (primary or backup) that the SP is currently booted from, not whether the installed firmware version is most current.

[-version <text>] - Firmware Version

Selects firmware image information for the Service Processors running the specified firmware version.

[-autoupdate {true|false}] - Firmware Autoupdate

Selects firmware image information for the Service Processors whose automatic update matches the specified configuration.

[-last-update-status {failed|passed}] - Last Update Status

Selects firmware image information for the Service Processors whose last update is of the specified status.

Examples

The following command displays basic firmware information for the Service Processors of all the nodes.

```
cluster1::> system service-processor image show
```

Node	Type	Image	Status	Is Current	Version
node1	SP	primary	installed	true	2.2X8
		backup	installed	false	2.2X5
node2	SP	primary	installed	true	2.2X8
		backup	installed	false	2.2X5

4 entries were displayed.

```
cluster1::>
```

The following command displays all available firmware information for the Service Processors of all the nodes.

```
cluster1::> system service-processor image show -instance
```

```

      Node: node1
      Image: primary
      Type: SP
      Image Status: installed
      Is Image Current: true
      Firmware Version: 2.2X8
      Firmware Autoupdate: true
      Last Update Status: passed

      Node: node1
      Image: backup
      Type: SP
      Image Status: installed
      Is Image Current: false
      Firmware Version: 2.2X5
      Firmware Autoupdate: true
      Last Update Status: passed

      Node: node2
      Image: primary
      Type: SP
      Image Status: installed
      Is Image Current: true
      Firmware Version: 2.2X8
      Firmware Autoupdate: true
      Last Update Status: passed

      Node: node2
      Image: backup
      Type: SP
      Image Status: installed
      Is Image Current: false
      Firmware Version: 2.2X5
      Firmware Autoupdate: true
      Last Update Status: passed
4 entries were displayed.
cluster1::>
```

system service-processor image update

Update Service Processor firmware

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system service-processor image update` command installs a new firmware version on the Service Processor of specified node in a cluster. If this command fails, it will display and log an appropriate error message and abort. No automatic command retries will be performed. This command also specifies which firmware image is to be installed on the Service Processor and how.

You can use the command [“system service-processor image update-progress show” on page 1241](#) to check the progress of the update.

The following parameter combinations are not supported for this command:

- `-update-type differential` with `-clear-logs true`
- `-baseline true` with `-package <text>`

Parameters

-node {<nodename>|local} - Node

This parameter specifies the node whose Service Processor's firmware is to be updated.

[-package <text>] - Firmware Package

This parameter specifies the package that will be installed. You can find the package file in the SP Update Repository field of the [“system node image package show” on page 1212](#) command. If you do not specify this parameter, the Service Processor is updated to the most recent version of the firmware that is available in the update repository. You must specify this parameter if `baseline` is false or omitted.

[-baseline {true|false}] - Install Baseline

If you set this parameter to true, the command installs the Service Processor firmware version that is bundled with the currently running release of Data ONTAP. This is a safety mechanism that allows you to revert the SP firmware to the version that was qualified and bundled with the currently running version of Data ONTAP on your system. If not specified, this parameter defaults to false.

[-clear-logs {true|false}] - Clear Logs After Update

If you set this parameter to `true`, the command resets log settings to factory default and clears contents of all logs maintained by the Service Processor, including:

- Event logs
- IPMI logs
- Forensics logs

Examples

The following command reverts the firmware on the Service Processor of the local node to the version that was packaged with the currently running release of Data ONTAP. A complete install will be performed, clearing all logs maintained by the Service Processor. The second command displays the status of the in-progress firmware install.

```
cluster1::> system service-processor image update -node local -update-type full -baseline true -clear-logs true
```

```
cluster1::>
```

```
cluster1::> system service-processor image update-progress show
```

Node	In Progress	Start Time	Percent Done	End Time
node1	yes	8/28/2012 20:00:34	99	-
node2	no	-	0	-

2 entries were displayed.

```
cluster1::>
```

system service-processor image update-progress commands

The update-progress directory

system service-processor image update-progress show

Display status for the latest Service Processor firmware update

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system service-processor image update-progress show` command displays the progress information of firmware updates on the Service Processor of the specified nodes. The "in-progress" field displays "no" if no update is in progress. This command does not display the progress of an SP firmware update that is triggered from the SP CLI.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

This parameter displays the status of Service Processor firmware update for the specified node.

[-start-time <MM/DD/YYYY HH:MM:SS>] - Latest SP Firmware Update Start Timestamp

This parameter displays the status of the Service Processor whose firmware update start time matches the specified value.

[-percent-done <integer>] - Latest SP Firmware Update Percentage Done

This parameter displays the status of the Service Processor whose update completion percentage matches the specified value.

[-end-time <MM/DD/YYYY HH:MM:SS>] - Latest SP Firmware Update End Timestamp

This parameter displays the status of the Service Processor whose firmware update end time matches the specified value.

[-in-progress {yes|no}] - Is Update in Progress

This parameter displays the update status of the Service Processor that matches the specified in-progress status.

Examples

The following example starts a firmware update on the local node and then uses the command `system service-processor image update-progress show` to display progress of firmware updates on Service Processors of all nodes in the system.

```
cluster1::> system service-processor image update -node local -update-type full -baseline true -clear-logs true
```

```
cluster1::>
```

```
cluster1::> system node service-processor image update-progress show
```

Node	In Progress	Start Time	Percent Done	End Time
node1	yes	8/28/2012 20:00:34	99	-
node2	no	-	0	-

2 entries were displayed.

```
cluster1::>
```

system service-processor log commands

Service Processor Logs

system service-processor log show-allocations

Display the Service Processor log allocation map

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system service-processor log show-allocations` command displays the allocation map of the Service Processor logs collected in the cluster. The Service Processor logs of a node are archived in the `mroot` directory of the collecting node. This command displays the sequence numbers for the Service Processor log files that reside in each collecting node.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

If you specify this parameter, the command displays the sequence numbers of Service Processor log files that the specified node has collected.

[-remote-node <text>] - Remote Node

If you specify this parameter, the command displays the sequence numbers of Service Processor log files that have been collected from the specified remote node.

[-seqList <integer>, ...] - Log File Sequence Numbers

If you specify this parameter, the command displays information about Service Processor log files with the specified sequence number.

Examples

The following example displays the allocation map of the Service Processor log files in the cluster.

```
cluster1::> system service-processor log show-allocation
Node           From Which Node      Log File Sequence
-----
cluster1-01
                cluster1-01      10, 11, 12, 13, 15
                cluster1-02      14, 15, 16, 17
cluster1-02
                cluster1-01      14
                cluster1-02      11, 12, 13
4 entries were displayed.

system service-processor network commands

Display and configure the Service Processor Network

system service-processor network modify

Modify the network configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system service-processor network modify` command modifies the network configuration of the Service Processor of specified node or nodes in a cluster.

If the SP automatic network configuration has been enabled, the `system service-processor network modify` command allows you to only enable or disable the SP IPv4 or Ipv6 network interface.

Parameters

-node {<nodename>|local} - Node

This parameter specifies the node whose Service Processor's network configuration is to be modified.

-address-family {IPv4|IPv6} - Address Family

This parameter specifies whether the IPv4 or the IPv6 configuration is to be modified.

[-enable {true|false}] - Interface Enabled

This parameter enables or disables the underlying network interface for the specified address-family. This is a mandatory parameter.

[-dhcp {v4|none}] - DHCP Status

If this parameter is set to v4, the Service Processor uses network configuration from the DHCP server. Otherwise, the Service Processor uses the network address you specify. If this parameter is not set to v4 or is not specified, you must specify the IP address, netmask, prefix-length, and gateway in the command. DHCP is not supported for IPv6 configuration.

[-ip-address <IP Address>] - IP Address

This parameter specifies the public IP address for the Service Processor. You must specify this parameter when the `-dhcp` parameter is not set to v4.

[-netmask <IP Address>] - Netmask

This parameter specifies the netmask for a Service Processor that uses an IPv4 address. This parameter has no effect if the IP address family is set to IPv6. You must specify this parameter when DHCP is not v4 and the address family is IPv4.

[-prefix-length <integer>] - Prefix Length of Subnet Mask

This parameter specifies the network prefix-length of the Service Processor if the address family is set to IPv6. The parameter has no effect when the address family is set to IPv4. You must specify this parameter when DHCP is not set to v4 and when the address family is set to IPv6.

[-gateway <IP Address>] - Gateway IP Address

This parameter specifies network gateway of the Service Processor. You must specify this parameter when DHCP is not set to v4.

Examples

The following example enables the network interface for IPv4 on the Service Processor of the local node. It first displays the current network configuration information of the local node to show the network interface is initially disabled, and then enables it with IP address 192.168.1.202, netmask as 255.255.255.0 and gateway as 192.168.1.1. It displays the interim state with SP Network Setup Status field showing "in-progress". It finally displays the network configuration again to confirm the specified values took effect.

```

system service-processor network show

Display the network configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system service-processor network show` command displays the network configuration of the Service Processor of each node in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

In case a node is offline or its Service Processor management daemon is down, the command displays the last known IP address of its Service Processor. Only the IP address is displayed in such cases.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects network configuration information for the Service Processor of the specified node.

[-address-family {IPv4|IPv6}] - Address Family

Selects network configuration information for the Service Processors that have the specified IP address family.

[-enable {true|false}] - Interface Enabled

Selects network configuration information for the Service Processors whose network interface for the given address-family is enabled or disabled as specified.

[-type {SP|NONE|BMC}] - Type of Device

Selects network configuration information for the Service Processors of the specified type.

[-status {online|offline|sp-daemon-offline|node-offline|degraded|rebooting|unknown|updating}] - Status

Selects network configuration information for the Service Processors whose status matches the specified value.

[-link-status {up|down|disabled|unknown}] - Link Status

Selects network configuration information for the Service Processors whose link status matches the specified value.

[-dhcp {v4|none}] - DHCP Status

Selects network configuration information for the Service Processors whose DHCP status matches the specified value.

[-ip-address <IP Address>] - IP Address

Selects network configuration information for the Service Processors that use the specified IP address.

[-mac <MAC Address>] - MAC Address

Selects network configuration information for the Service Processors that use the specified MAC address.

[-netmask <IP Address>] - Netmask

This parameter displays information only for the Service Processors that use the specified netmask.

[-prefix-length <integer>] - Prefix Length of Subnet Mask

Selects network configuration information for the Service Processors whose prefix length of subnet mask matches the specified value.

[-router-ip <IP Address>] - Router Assigned IP Address

Selects network configuration information for the Service Processors whose router-assigned IP address matches the specified value.

[-link-local-ip <IP Address>] - Link Local IP Address

Selects network configuration information for the Service Processors whose link local IP address matches the specified value.

[-gateway <IP Address>] - Gateway IP Address

Selects network configuration information for the Service Processors whose gateway IP address matches the specified value.

[-time-last-updated <text>] - Time Last Updated

Selects network information for the Service Processors that have the specified time stamp showing when configuration was last updated.

[-subnet-name <text>] - Subnet Name

Selects network information for the Service Processors that use the specified subnet-name for SP automatic configuration.

[-is-ipv6-ra-enabled {true|false}] - Enable IPv6 Router Assigned Address

Selects network information for the Service Processors that have the specified status for IPv6 router-assigned address.

[-setup-status {not-setup|succeeded|in-progress|failed}] - SP Network Setup Status

Selects network information for the Service Processors that have the specified status for network interface setup.

[-setup-failure-reason {success|subnet-out-of-address|invalid-subnet|other-error}] - SP Network Setup Failure Reason

Selects network information for the Service Processors that have the specified reason for network interface setup failure.

Examples

The following example displays basic network configuration information for the Service Processors of all the nodes.

```
cluster1::> system service-processor network show
```

Node	Status	Address Type	Link State	IP Address
node1	online	IPv4	up	192.168.1.201
DHCP: v4 MAC Address: ab:cd:ef:fe:ed:01 Network Gateway: 192.168.1.1 Network Mask (IPv4 only): 255.255.255.0 Prefix Length (IPv6 only): - IPv6 RA Enabled: - Subnet Name: - SP Network Setup Status: succeeded

cluster1::>

system service-processor network auto-configuration commands

Manage Service Processor Auto-Configuration Resource

system service-processor network auto-configuration disable

Disable Service Processor Auto-Configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system service-processor network auto-configuration disable` command disables the SP's use of subnet resource for the automatic configuration of its networking port. This command is a cluster-wide configuration. When you disable the SP automatic network configuration, all SPs in the cluster will be configured to use IPv4 DHCP. Any addresses previously allocated from the subnet to the SP will be released. If the SP fails to obtain an IPv4 IP address from the DHCP server, an EMS message warns you about the failure. The IPv6 interface will be disabled.

Parameters

-address-family {IPv4|IPv6} - Subnet Address Family

This parameter specifies whether the IPv4 or the IPv6 automatic configuration is to be disabled for the SP.

Examples

The following example disables the automatic configuration for IPv4 on the SP. It first displays the current network configuration and then disables the SP IPv4 automatic network configuration.

```
cluster1::>system service-processor network show
```

Node	Status	Family	Link State	IP Address

node1	online	IPv4	up	192.168.1.2
	DHCP: none			
		MAC Address: ab:cd:ef:fe:ed:01		
		Network Gateway: 192.168.1.1		
		Network Mask (IPv4 only): 255.255.255.0		
		Prefix Length (IPv6 only): -		
		IPv6 RA Enabled: -		
		Subnet Name: ipv4_test		
		SP Network Setup Status: succeeded		

```
cluster1::>system service-processor network auto-configuration disable -address-family Ipv4
```

```
cluster1::>system service-processor network auto-configuration show
```

Cluster Name	SP IPv4 Subnet Name	SP IPv6 Subnet Name

cluster1	-	-

```
cluster1::>system service-processor network show
```

Node	Status	Family	Link State	IP Address

node1	online	IPv4	up	192.168.1.184
		DHCP: v4		
		MAC Address: ab:cd:ef:fe:ed:01		

```

Network Gateway: 192.168.1.1
Network Mask (IPv4 only): 255.255.255.0
Prefix Length (IPv6 only): -
IPv6 RA Enabled: -
Subnet Name: -
SP Network Setup Status: succeeded

```

system service-processor network auto-configuration enable

Enable Service Processor Auto-Configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system service-processor network auto-configuration enable` command enables the automatic network configuration for the SP. This is a cluster-wide configuration. Every node in the cluster will use the specified subnet to allocate IP address, subnet mask and gateway address for the SP configuration. When the SP automatic network configuration is enabled, you do not need to manually manage the SP network of individual nodes. A node that subsequently joins the cluster uses the specified subnet to configure its SP network automatically.

Prior to running this command, the subnet you want to use for the SP automatic network configuration must already be defined in the cluster and must have no resource conflicts with the SP network interface.

Parameters

-address-family {IPv4|IPv6} - Subnet Address Family

This parameter specifies whether the IPv4 or the IPv6 automatic configuration is to be enabled for the SP.

-subnet-name <text> - Subnet Name

This parameter specifies the network subnet that the SP will use for automatic network configuration.

Examples

The following example enables the automatic network configuration for IPv4 on the SP. It first displays the current SP network configuration, displays available network subnet in the cluster, and then enable the SP to use the subnet for IPv4 automatic configuration.

```
cluster1::>system service-processor network show
```

Node	Status	Address Family	Link State	IP Address
node1	online	IPv4	up	192.168.1.201

```

DHCP: v4
MAC Address: ab:cd:ef:fe:ed:01
Network Gateway: 192.168.1.1
Network Mask (IPv4 only): 255.255.255.0
Prefix Length (IPv6 only): -
IPv6 RA Enabled: -
Subnet Name: -
SP Network Setup Status: succeeded

```

```
cluster1::> network subnet show
```

```

IPspace: Default
Subnet
Name      Subnet      Broadcast Domain  Gateway  Avail/Total  Ranges
-----
ipv4_test 192.168.1.0/24 Default  192.168.1.1      3/5      192.168.1.2-192.168.1.6

```

```
cluster1::>system service-processor network auto-configuration enable -address-family ipv4 -subnet-name ipv4_test
```

```
cluster1::system service-processor network> show
```

Node	Status	Address Family	Link State	IP Address

node1	online	IPv4	up	192.168.1.2
DHCP: none				
MAC Address: ab:cd:ef:fe:ed:01				
Network Gateway: 192.168.1.1				
Network Mask (IPv4 only): 255.255.255.0				
Prefix Length (IPv6 only): -				
IPv6 RA Enabled: -				
Subnet Name: ipv4_test				
SP Network Setup Status: succeeded				

system service-processor network auto-configuration show

Display Service Processor Auto-Configuration Setup

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system service-processor network auto-configuration show` command displays the names of the IPv4 and IPv6 network subnet objects configured in the cluster that the SP uses for automatic configuration.

Examples

The following example shows that the SP is configured to use the "ipv4_test" IPv4 subnet in the cluster for the SP automatic network configuration.

```
cluster1::>system service-processor network auto-configuration show
Cluster Name      SP IPv4 Subnet Name      SP IPv6 Subnet Name
-----
cluster1         ipv4_test -
```

system service-processor ssh commands

The ssh directory

system service-processor ssh add-allowed-addresses

Add IP addresses to the list that is allowed to access the Service Processor

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system service-processor ssh add-allowed-addresses` command grants IP addresses access to the Service Processor.

Parameters

-allowed-addresses <IP Address/Mask>, ... - Public IP Addresses

Use this parameter to specify one or more IP addresses with corresponding netmasks. The value should be specified in the format of address/netmask, for example, 10.98.150.10/24, fd20:8b1e:b255:c09b::/64. Use commas to separate multiple address/netmask pairs. If "0.0.0.0/0, ::/0" is specified in the parameter, any IP address is allowed to access the Service Processor.

Examples

The following examples grant the specified IP addresses access to the Service Processor and display the list of public IP addresses that are allowed to access the Service Processor.

```
cluster1:: system service-processor ssh show
Allowed Addresses: 0.0.0.0/0, ::/0

cluster1:: system service-processor ssh add-allowed-addresses -allowed-addresses 192.168.1.202/24, 192.168.10.201/24
Warning: The default "allow all" setting (0.0.0.0/0, ::/0) will be replaced
        with your changes. Do you want to continue? [y/n]: y

cluster1:: system service-processor ssh show
Allowed Addresses: 192.168.1.202/24, 192.168.10.201/24

The following example enables all IP addresses to access the Service Processor.
cluster1:: system service-processor ssh add-allowed-addresses -allowed-addresses 0.0.0.0/0, ::/0

cluster1:: system service-processor ssh show
Allowed Addresses: 0.0.0.0/0, ::/0

cluster1::
```

system service-processor ssh remove-allowed-addresses

Remove IP addresses from the list that is allowed to access the Service Processor

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system service-processor ssh remove-allowed-addresses` command blocks the specified IP address from accessing the Service Processor. If all IP addresses are removed from the access list, then the Service Processor is not accessible from any IP address.

Parameters

-allowed-addresses <IP Address/Mask>, ... - Public IP Addresses

Use this parameter to specify one or more IP addresses with corresponding netmasks. The value should be specified in the format of address/netmask, for example, 10.98.150.10/24, fd20:8b1e:b255:c09b::/64. Use commas to separate multiple address/netmask pairs.

Examples

The following example prevents the specified IP addresses from accessing the Service Processor. It also displays the list of public IP addresses that are allowed to access the Service Processor.

```
cluster1:: system service-processor ssh show
Allowed Addresses: 192.168.1.202/24, 192.168.10.201/24

cluster1:: system service-processor ssh remove-allowed-addresses -allowed-addresses 192.168.1.202/24, 192.168.10.201/24

Warning: If all IP addresses are removed from the allowed address list, all IP
        addresses will be denied access. To restore the "allow all" default,
        use the "system service-processor ssh add-allowed-addresses
        -allowed-addresses 0.0.0.0/0, ::/0" command. Do you want to continue?
        [y/n]: y

cluster1:: system service-processor ssh show
Allowed Addresses: -

cluster1::
```

system service-processor ssh show

Display SSH security information about the Service Processor

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system service-processor ssh show` command displays the IP addresses that are allowed to access the Service Processor by using SSH.

Examples

The following example displays SSH security information about the Service Processor.

```
cluster1::> system service-processor ssh show
Allowed Addresses: 0.0.0.0/0, ::/0

cluster1::>
```

system services commands

Manage system services

system services firewall commands

Manage local firewall configuration

system services firewall modify

Modify firewall status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system services firewall modify` command modifies a node's firewall configuration.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the node on which to modify firewall configuration.

[-enabled {true|false}] - Service Enabled

Use this parameter to specify whether firewall protection is enabled ("*true*") or disabled ("*false*") for the node's network ports. The default setting is *true*.

[-logging {true|false}] - (DEPRECATED)-Enable Logging

Note: This parameter is deprecated and may be removed in a future version of Data ONTAP.

Use this parameter to specify whether logging is enabled ("*true*") or disabled ("*false*") for the firewall service. The default setting is *false*.

Examples

The following example enables firewall protection and logging for a node named `node1`:

```
cluster1::> system services firewall modify -node node1 -enabled true -logging true
```

system services firewall show

Show firewall status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system services firewall show` command displays firewall configuration and logging information. If the command is issued without any parameters, it displays information about all nodes in the cluster. You can also query specific nodes for their firewall information by running the command with the `-node` parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects information about the firewall settings on the node you specify.

[-enabled {true|false}] - Service Enabled

Selects information about the nodes with the firewall enabled ("*true*") or disabled ("*false*").

[-logging {true|false}] - (DEPRECATED)-Enable Logging

Note: This parameter is deprecated and may be removed in a future version of Data ONTAP.

Selects information about the nodes with firewall logging enabled ("*true*") or disabled ("*false*").

Examples

The following example displays information about firewall configuration for all nodes in the cluster:

```
cluster1::> system services firewall show
Node           Enabled Logging
-----
node0           true    false
node1           true    false
node2           true    false
node3           true    false
4 entries were displayed.
```

system services firewall policy commands

Manage firewall policy configuration

system services firewall policy clone

Clone an existing firewall policy

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system services firewall policy clone` command creates a new firewall policy that is an exact copy of an existing policy, but has a new name.

Parameters

-vserver <text> - Vserver owning the Policy

Use this parameter to specify the name of the Vserver owning the existing policy to copy.

-policy <text> - Firewall Policy to be Cloned

Use this parameter to specify the name of the existing policy to copy.

[-destination-vserver <text>] - Vserver owning the New Firewall Policy

Use this parameter to specify the name of the Vserver that will own the new policy to create.

-destination-policy <text> - Name of New Firewall Policy

Use this parameter to specify the name of the new policy to create.

Examples

This example creates a new firewall policy named "data2" on Vserver "vs0" from an existing firewall policy named "data" on Vserver "vs1".

```
cluster1::> system services firewall policy clone -vserver vs0 -policy data -destination-vserver vs1 -destination-policy data2
```

system services firewall policy create

Create a firewall policy entry for a network service

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system services firewall policy create` command creates a firewall policy entry with the specified name and network service. This command is used both to create the first network service associated with a new firewall policy, or to add to an existing firewall policy by associating another network service with an existing policy. You can optionally specify one or more IP addresses with corresponding netmasks that are allowed to use the firewall policy entry.

You can use the [“network interface modify” on page 338](#) command with the `-firewall-policy` parameter to put a firewall policy into effect for a given logical interface by modifying that logical interface to use the specified firewall policy.

Parameters**-vserver <vserver> - Vserver Name**

Use this parameter to specify the name of the Vserver on which the policy is to be created.

-policy <textpolicy_name> - Policy

Use this parameter to specify the name of the policy that is to be created.

-service <service> - Service

Use this parameter to specify the network service that is associated with the policy. Possible values include:

- default - The default protocol or protocols for the port to which the firewall is applied
- http - The HTTP protocol
- https - The HTTPS protocol
- ntp - The NTP protocol
- rsh - The RSH protocol
- snmp - The SNMP protocol
- ssh - The SSH protocol
- telnet - The Telnet protocol

-allow-list <IP Address/Mask>, ... - Allowed IPs

Use this parameter to specify one or more IP addresses with corresponding netmasks that are to be allowed by this firewall policy. The correct format for this parameter is address/netmask, similar to "192.0.2.128/25". Multiple address/netmask pairs should be separated with commas. Use the value 0.0.0.0/0 for "any".

Examples

The following example creates a firewall policy named data that uses the SSH protocol and enables access from all IP addresses on the 192.0.2.128/25 subnet:

```
cluster1::> system services firewall policy create -policy data -service ssh -allow-list 192.0.2.128/25
```

The following example adds an entry to the firewall policy named data, associating the HTTPS protocol with that policy and enabling access from all IP addresses on the 192.0.2.128/25 subnet:

```
cluster1::> system services firewall policy create -policy data -service https -allow-list 192.0.2.128/25
```

system services firewall policy delete

Remove a service from a firewall policy

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system services firewall policy delete` command deletes a firewall policy. You cannot delete a policy that is being used by a logical interface. Use the [“network interface modify” on page 338](#) command with the `-firewall-policy` parameter to change a network interface's firewall policy.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the Vserver of the policy to delete.

-policy <textpolicy_name> - Policy

Use this parameter to specify the name of the policy to delete.

-service <service> - Service

Use this parameter to specify the policy's network service to delete.

Examples

The following example deletes a firewall policy that uses the Telnet protocol on the policy named data:

```
cluster1::> system services firewall policy delete -policy data -service telnet
```

Use wildcards to delete entire policies at once, or particular services from every policy. This example deletes the entire intercluster policy.

```
cluster1::> system services firewall policy delete -policy intercluster -service *
```

This example deletes the telnet service from every policy.

```
cluster1::> system services firewall policy delete -policy * -service telnet
```

system services firewall policy modify

Modify a firewall policy entry for a network service

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The [“system services firewall modify” on page 1254](#) command enables you to modify the list of IP addresses and netmasks associated with a firewall policy.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the Vserver of the policy to modify.

-policy <textpolicy_name> - Policy

Use this parameter to specify the name of the policy to modify.

-service <service> - Service

Use this parameter to specify the policy's network service to modify.

[-allow-list <IP Address/Mask>, ...] - Allowed IPs

Use this parameter to specify one or more IP addresses with corresponding netmasks that are allowed by this firewall policy. The correct format for this parameter is address/netmask, similar to "192.0.2.128/25". Multiple address/netmask pairs should be separated with commas. Use the value 0.0.0.0/0 for "any".

Examples

The following example modifies the firewall policy named data that uses the SSH protocol to enable access from all addresses on the 192.0.2.128 subnet:

```
cluster1::> system services firewall policy modify -policy data -service ssh -allow-list 192.0.2.128/25
```

system services firewall policy show

Show firewall policies

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `system services firewall policy show` command displays information about firewall policies.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

[-instance]}

Use this parameter to display all the fields for the specified policies.

[-vserver <vserver>] - Vserver Name

Use this parameter to display information only about the Vserver you specify.

[-policy <textpolicy_name>] - Policy

Use this parameter to display information about the policy you specify.

[-service <service>] - Service

Use this parameter to display information about the services you specify.

[-allow-list <IP Address/Mask>, ...] - Allowed IPs

Use this parameter to display information about the firewall policies that match the list of allowed IP addresses and netmasks you specify. The correct format for this parameter is address/netmask, similar to "192.0.2.128/25". Multiple address/netmask pairs should be separated with commas.

[-ipspace <text>] - IPspace

Use this parameter to display information only about the IPspace you specify.

Examples

The following example displays information about all firewall policies:

```
cluster1::> system services firewall policy show
Vserver Policy      Service      Allowed
-----
cluster1
  data
    dns          0.0.0.0/0, ::/0
    ndmp          0.0.0.0/0, ::/0
    ndmps         0.0.0.0/0, ::/0
cluster1
  intercluster
    ndmp          0.0.0.0/0, ::/0
    ndmps         0.0.0.0/0, ::/0
cluster1
  mgmt
    dns          0.0.0.0/0, ::/0
    http         0.0.0.0/0, ::/0
    https        0.0.0.0/0, ::/0
    ndmp         0.0.0.0/0, ::/0
```

```
ndmps      0.0.0.0/0, ::/0
ntp        0.0.0.0/0, ::/0
snmp       0.0.0.0/0, ::/0
ssh        0.0.0.0/0, ::/0
```

system services manager commands

Manage services in a cluster

system services manager install commands

Manage installed services

system services manager install show

Display a list of installed services

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system services manager install show` command displays information about installed services.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-service <text>] - Service

Selects information about installed services that have the name you specify.

[-version <service version>] - Version

Selects information about installed services that have the version number you specify.

[-constituent <text>] - Constituent

Selects information about installed services that have the constituent process you specify.

[-nodes {<nodename>|local}, ...] - Nodes

Selects information about services that are installed on the nodes you specify.

[-description <text>] - Description

Selects information about installed services that match the description you specify.

Examples

The following example shows typical output from a two-node cluster.

```
cluster1::> system services manager install show
Service      Version Constituent Nodes
-----
diagnosis
              1.0      schmd      node1, node2
              1.0      shmd       node1, node2
2 entries were displayed.
```

system services manager policy commands

Manage service policies

system services manager policy add

Add a new service policy

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system services manager policy add` command adds a new service policy to the services manager. Policies determine which versions of a service can run on the nodes of the cluster.

Parameters

-service <text> - Service

Use this parameter to specify the name of the service for which to add a policy.

-version <service version> - Version

Use this parameter to specify the minimum version number of the service to run.

Examples

This example adds a service manager policy for version 1.0 of the diagnosis service.

```
cluster1::> system services manager policy add -service diagnosis -version 1.0
```

system services manager policy remove

Remove a service policy

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system services manager policy remove` command removes a policy from the services manager. Policies determine which versions of a service can run on the nodes of the cluster.

Parameters

-service <text> - Service

Use this parameter to specify the name of the service from which to remove a policy.

-version <service version> - Version

Use this parameter to specify the version number that is configured by the policy to remove.

Examples

The following example shows the removal of the service policy for version 1.0 of the diagnosis service.

```
cluster1::> system services manager policy remove -service diagnosis -version 1.0
```

system services manager policy setstate

Enable/disable a service policy

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system services manager policy setstate` command enables or disables services manager policies. Use the [“system services manager policy show” on page 1261](#) command to display information about configured policies.

Parameters

-service <text> - Service

Use this parameter to set the state of the policy you specify.

-version <service version> - Version

Use this parameter to set the state of the policy with the version number you specify.

-state {on|off} - State

Use this parameter with the value "on" to enable the policy. Use this parameter with the value "off" to disable the policy.

Examples

The following example sets the policy for version 1.0 of the diagnosis service to off.

```
cluster1::> system services manager policy setstate -service diagnosis -version 1.0 -state off
```

system services manager policy show

Display service policies

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system services manager policy show` command displays information about policies that determine which versions of a service can run on the nodes of the cluster.

Use the [“system services manager status show” on page 1262](#) command to view information about services that are configured to run in the cluster.

Parameters

[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-service <text>] - Service

Selects policies that apply to the service you specify.

[-version <service version>] - Version

Selects policies that have the version number you specify.

[-constituent <text>] - Constituent

Selects policies that have the constituent process you specify.

[-state {on|off}] - State

Use this parameter with the value "on" to select information about policies that are currently active. Use this parameter with the value "off" to select information about policies that are not currently active.

[-num-active <integer>] - Number Active

Selects policies that have the number of active (running) instances you specify.

[-target-nodes <service affinity>, ...] - Target Nodes

Selects policies that are configured to run on the nodes you specify.

[-tag <UUID>] - Tag (privilege: advanced)

Selects policies that have the UUID you specify. Use this parameter with the `-fields` parameter to display a list of the UUIDs of configured services.

Examples

The following example shows typical output for this command.

```
cluster1::> system services manager policy show
Service      Version State Constituent Number Target
                  Active Nodes
-----
diagnosis    1.0    on    schmd      1    any
              1.0    on    shmd       1    any
2 entries were displayed.
```

system services manager status commands

Display service status

system services manager status show

Display the status of a service

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system services manager status show` command displays the status of system services that are configured to run in the cluster.

System services run on the nodes of the cluster based on policies. Policies determine which versions of a service can run on the nodes of the cluster. Use the [“system services manager policy show” on page 1261](#) command to view existing policies.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-service <text>] - Service

Selects information about services that match the service name you specify.

[-version <service version>] - Version

Selects information about services that are configured to run the version number you specify. The configured version is the minimum version that is allowed to run in the cluster according to a policy. Use the [“system services manager policy show” on page 1261](#) command to view information about service policies.

[-constituent <text>] - Constituent

Selects information about services that have the constituent process you specify.

[-actual-version <service version>] - Actual Version

Selects information about services that are running the version number you specify. This number can be higher than the configured version if a more recent version is installed on the node that is running the service.

[-node <nodename>] - Node

Selects information about services that the services manager has assigned to run on the nodes you specify. If the service state is "running", the service is running on these nodes.

[-state <svc_state>] - State

Selects information about services that are in the state you specify.

[-is-running {true|false}] - Is Running

Use this parameter with the value "true" to select information about services that are currently running. Use this parameter with the value "false" to select information about services that are not currently running.

Examples

The example below shows typical output for a simple cluster.

```
cluster1::> system services manager status show
Service          Version Constituent Actual  Node      State
                  Version
-----
```

```
diagnosis
      1.0    schmd      1.0    cluster1-01    running
      1.0    shmd      1.0    cluster1-01    running
2 entries were displayed.
```

system services ndmp commands

Manage NDMP services

These commands can be used to view or modify the configurations of NDMP service across all the nodes in the cluster. These commands are not supported on Infinite Volumes.

system services ndmp kill

Kill the specified NDMP session

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system services ndmp kill` command is used to terminate a specific NDMP session on a particular node in the cluster. This command is not supported on Infinite Volumes.

Parameters

<integer> - Session Identifier
Session ID of the NDMP session.

Examples

The following example shows how a specific NDMP session on the node named node1 can be terminated:

```
cluster1::> system services ndmp kill 4323 -node node1
```

system services ndmp kill-all

Kill all NDMP sessions

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system services ndmp kill-all` command is used to terminate all NDMP sessions on a particular node in the cluster. This command is not supported on Infinite Volumes.

Parameters

-node {<nodename>|local} - Node
Node on which all NDMP sessions needs to be terminated.

Examples

The following example shows how all NDMP sessions on the node named node1 can be terminated:

```
cluster1::> system services ndmp kill-all -node node1
```

system services ndmp modify

(DEPRECATED)-Modify NDMP service configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "[vserver services ndmp modify](#)" on [page 2024](#)" command.

The `system services ndmp modify` command allows you to modify the NDMP configurations for a node in the cluster. One or more of the following configurations can be modified:

- Enable/disable NDMP service
- Enable/disable sending the NDMP password in clear text. Note that MD5 authentication mode is always enabled.
- NDMP user ID

This command is not supported on Infinite Volumes.

Parameters

-node {<nodename>|local} - Node

This specifies the node whose NDMP configuration is to be modified.

[-enable {true|false}] - NDMP Service Enabled

This optionally specifies whether NDMP is enabled on the node. The default setting is `true`.

[-clear-text {true|false}] - Allow Clear Text Password

This optionally specifies whether the NDMP password can be sent in clear text. The default setting is `true`.

[-user-id <text>] - NDMP User ID

This optionally specifies the ID of the NDMP user.

Examples

The following example modifies the NDMP configuration on a node named `node1`. The configuration enables NDMP, disables sending the password in clear text, and specifies an NDMP user named `ndmp`:

```
cluster1::> system services ndmp modify -node node1 -enable true
-clear-text false -user-id ndmp
```

system services ndmp off

(DEPRECATED)-Disable NDMP service

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "[vserver services ndmp off](#)" on [page 2029](#)" command.

The `system services ndmp off` command is used to disable the NDMP service on any node in the cluster. This command is not supported on Infinite Volumes.

Parameters

-node {<nodename>|local} - Node

The specific node on which NDMP service is to be disabled.

Examples

The following example is used to turn off the NDMP service on node named `node1`:

```
cluster1::> system services ndmp off -node node1
```

system services ndmp on

(DEPRECATED)-Enable NDMP service

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware " [vserver services ndmp on](#) " on page 2029" command.

The `system services ndmp on` command is used to enable the NDMP service across any node in the cluster. This command is not supported on Infinite Volumes.

Parameters

-node {<nodename>|local} - Node

The specific node on which the NDMP service is to be enabled.

Examples

The following example is used to turn on the NDMP service on node named node1:

```
cluster1::> system services ndmp on -node node1
```

system services ndmp password

(DEPRECATED)-Change the NDMP password for the node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware " [vserver services ndmp generate-password](#) " on page 2022" command.

The `system services ndmp password` command is used to change the NDMP password for a node in the cluster. This command is not supported on Infinite Volumes.

Parameters

-node {<nodename>|local} - Node

The specific node for which the password is to be changed.

Examples

The following example is used to change the NDMP password for the node named node1:

```
cluster1::> system services ndmp password -node node1
```

```
Please enter password:
```

```
Confirm password:
```

system services ndmp probe

Display list of NDMP sessions

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system services ndmp probe` command displays diagnostic information about all the NDMP sessions in the cluster. The following fields are displayed for each of the sessions:

- Node
- Session identifier
- NDMP version
- Session authorized
- Data state
- Data operation
- Data server halt reason
- Data server connect type
- Data server connect address
- Data server connect port
- Data bytes processed
- Mover state
- Mover mode
- Mover pause reason
- Mover halt reason
- Mover record size
- Mover record number
- Mover bytes moved
- Mover seek position
- Mover bytes left to read
- Mover window offset
- Mover window length
- Mover position
- Mover SetRecordSize flag
- Mover SetWindow flag
- Mover connect type
- Mover connect address
- Mover connect port
- Effective host
- NDMP client address
- NDMP client port
- SCSI device ID
- SCSI hostadapter
- SCSI target ID
- SCSI LUN ID
- Tape device
- Tape mode
- Is Secure Control Connection
- Data Backup Mode
- Data Path
- NDMP Source Address

This command is not supported on Infinite Volumes.

Parameters

[-node <nodename>|local] - Node

If this parameter is specified, the command displays information about the sessions running on the specified node only. Node should be a valid node name.

[-session-id <integer>] - Session Identifier

If this parameter is specified, the command displays information only about the specified session.

[-ndmp-version <integer>] - NDMP Version

This parameter refers to the NDMP protocol version being used in the session.

[-session-authorized {true|false}] - Session Authorized

This parameter indicates whether an NDMP session is authenticated or not.

[-data-state <component state>] - Data State

This parameter identifies the current state of the data server's state machine.

[-data-operation <data operation>] - Data Operation

This parameter identifies the data server's current operation.

[-data-halt-reason <halt reason>] - Data Server Halt Reason

This parameter identifies the event that caused the data server state machine to enter the HALTED state.

[-data-con-addr-type <address type>] - Data Server Connect Type

This parameter specifies the type of data connection established by the data server. The data connection can be established locally within a given system or between remote networked systems.

[-data-con-addr <text>] - Data Server Connect Address

This parameter specifies the connection endpoint information for the data server's data connection.

[-data-con-port <integer>] - Data Server Connect Port

This parameter specifies the TCP/IP port that the data server will use when establishing a data connection.

[-data-bytes-processed <integer>] - Data Bytes Processed

This parameter represents the cumulative number of data stream bytes transferred between the backup or recovery method and the data connection during the current data operation.

[-mover-state <component state>] - Mover State

This parameter identifies the current state of the NDMP tape server's mover state machine.

[-mover-mode <mover mode>] - Mover Mode

This parameter identifies the direction of the mover data transfer.

[-mover-pause-reason <pause reason>] - Mover Pause Reason

This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

[-mover-halt-reason <halt reason>] - Mover Halt Reason

This parameter identifies the event that caused the mover state machine to enter the HALTED state.

[-mover-record-size <integer>] - Mover Record Size

This parameter represents the current mover record size in bytes.

[-mover-record-num <integer>] - Mover Record Number

This parameter represents the last tape record processed by the mover.

[-mover-bytes-moved <integer>] - Mover Bytes Moved

This parameter represents the cumulative number of data stream bytes written to the data connection or the number of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode of mover operation.

[-mover-*seek-position* <integer>] - Mover Seek Position

This parameter represents the data stream offset of the first byte the DMA requested the mover to transfer to the data connection during a mover read operation.

[-mover-bytes-left-to-read <integer>] - Mover Bytes Left to Read

This parameter represents the number of data bytes remaining to be transferred to the data connection to satisfy the current NDMP_MOVER_READ request.

[-mover-window-offset <integer>] - Mover Window Offset

This parameter represents the absolute offset of the first byte of the mover window within the overall data stream.

[-mover-window-length <integer>] - Mover Window Length

This parameter represents the length of the current mover window in bytes.

[-mover-position <integer>] - Mover Position

This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-position should be an integer.

[-mover-setrecordsize-flag {true|false}] - Mover SetRecordSize Flag

This parameter is used by the DMA to establish the record size used for mover-initiated tape read and write operations.

[-mover-setwindow-flag {true|false}] - Mover SetWindow Flag

This parameter represents whether a mover window has been set or not. A mover window represents the portion of the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

[-mover-con-addr-type <address type>] - Mover Connect Type

This parameter specifies the type of data connection established by the mover. The data connection can be established locally within a given system or between remote networked systems.

[-mover-con-addr <text>] - Mover Connect Address

This parameter specifies the endpoint address or addresses that the mover will use when establishing a data connection.

[-mover-con-port <integer>] - Mover Connect Port

This parameter specifies the TCP/IP port that the mover will use when establishing a data connection.

[-eff-host <host type>] - Effective Host

This parameter indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.

[-client-addr <text>] - NDMP Client Address

This parameter specifies the client's IP address.

[-client-port <integer>] - NDMP Client Port

This parameter specifies the client's port number.

[-spt-device-id <text>] - SCSI Device ID

This parameter specifies the SCSI device ID.

[-spt-ha <integer>] - SCSI Host Adapter

This parameter specifies the SCSI host adapter.

[-spt-scsi-id <integer>] - SCSI Target ID

This parameter specifies the SCSI target.

[-spt-scsi-lun <integer>] - SCSI LUN ID

This parameter specifies the SCSI LUN ID.

[-tape-device <text>] - Tape Device

This parameter specifies the name to identify the tape device.

[-tape-mode <mover mode>] - Tape Mode

This parameter specifies the mode in which tapes are opened.

[-is-secure-control-connection {true|false}] - Is Secure Control Connection

This parameter specifies whether the control connection is secure or not.

[-data-backup-mode <text>] - Data Backup Mode

This parameter specifies whether the mode of data backup is Dump or SMTape.

[-data-path <text>] - Data Path

This parameter specifies the path of data being backed up.

[-source-addr <text>] - NDMP Source Address

This parameter specifies the control connection IP address of the NDMP session.

Examples

The following example displays diagnostic information about all the sessions in the cluster:

```
cluster1::> system services ndmp probe

      Node: cluster1-01
      Session identifier: 4952
      NDMP version: 4
      Session authorized: true
      Data state: IDLE
      Data operation: NOACTION
      Data server halt reason: NA
      Data server connect type: LOCAL
....
...

      Node: cluster1-02
      Session identifier: 5289
      NDMP version: 4
      Session authorized: true
      Data state: IDLE
      Data operation: NOACTION
      Data server halt reason: NA
      Data server connect type: LOCAL
....
...
```

The following example displays diagnostic information of sessions running on the node cluster1-01 only:

```
cluster1::> system services ndmp probe -node cluster1-01

      Node: cluster1-01
      Session identifier: 4952
      NDMP version: 4
      Session authorized: true
      Data state: IDLE
      Data operation: NOACTION
      Data server halt reason: NA
      Data server connect type: LOCAL
....
...
```

system services ndmp show

(DEPRECATED)-Display NDMP service configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "[vserver services ndmp show](#)" on [page 2034](#)" command.

The `system services ndmp show` command displays the following information about the NDMP configuration across all the nodes in the cluster:

- Node name
- Whether NDMP is enabled on the node
- Whether sending the NDMP password in clear text is enabled on the node
- NDMP user ID

A combination of parameters can be optionally supplied to filter the results based on specific criteria. This command is not supported on Infinite Volumes.

Parameters

{ [-fields <fieldname>, ...]

If this parameter is specified, the command displays only the fields that you specify.

| [-instance]}

If this parameter is specified, the command displays detailed information about all entries.

[-node {<nodename>|/local}] - Node

Selects information about the specified node.

[-enable {true|false}] - NDMP Service Enabled

Selects information about the nodes where NDMP is enabled/disabled.

[-clear-text {true|false}] - Allow Clear Text Password

Selects information about the nodes whose clear-text setting matches the specified value.

[-user-id <text>] - NDMP User ID

Selects information about the nodes that have the specified NDMP user ID.

Examples

The following example displays information about the NDMP configuration of all nodes in the cluster:

```
cluster1::> system services ndmp show
Node      Enabled  Clear Text  User ID
-----
node0      true     true        ndmp
node1      true     true        ndmp
node2      true     true        ndmp
node3      true     true        ndmp
4 entries were displayed.
```

system services ndmp status

Display list of NDMP sessions

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system services ndmp status` command lists all the NDMP sessions in the cluster. By default it lists the following details about the active sessions:

- Node
- Session ID

A combination of parameters can be optionally supplied so as to list only those sessions which match specific conditions. A short description of each of the parameter is provided in the parameters section. This command is not supported on Infinite Volumes.

Parameters

{ [-fields <fieldname>, ...]

This optional parameter specifies which all additional fields to display. Any combination of the following fields are valid:

- ndmp-version
- session-authorized
- data-state
- data-operation
- data-halt-reason
- data-con-addr-type
- data-con-addr
- data-con-port
- data-bytes-processed
- mover-state
- mover-mode
- mover-pause-reason
- mover-halt-reason
- mover-record-size
- mover-record-num
- mover-bytes-moved
- mover-seek-position
- mover-bytes-left-to-read
- mover-window-offset
- mover-window-length
- mover-position
- mover-setrecordsize-flag
- mover-setwindow-flag
- mover-con-addr-type
- mover-con-addr
- mover-con-port
- eff-host
- client-addr
- client-port
- spt-device-id
- spt-ha
- spt-scsi-id
- spt-scsi-lun
- tape-device

- tape-modes
- is-secure-control-connection
- data-backup-mode
- data-path
- source-addr

[-instance]

If this parameter is specified, the command displays detailed information about all the active sessions.

[-node {<nodename>|local}] - Node

If this parameter is specified, the command displays information about the sessions running on the specified node only. Node should be a valid node name.

[-session-id <integer>] - Session Identifier

If this parameter is specified, the command displays information about specific NDMP session. A session-id is a number used to identify a particular NDMP session.

[-ndmp-version <integer>] - NDMP Version

This parameter refers to the NDMP protocol version being used in the session.

[-session-authorized {true|false}] - Session Authorized

This field indicates whether an NDMP session is authenticated or not.

[-data-state <component state>] - Data State

This field identifies the current state of the data server's state machine.

[-data-operation <data operation>] - Data Operation

This field identifies the data server's current operation.

[-data-halt-reason <halt reason>] - Data Server Halt Reason

This field identifies the event that caused the data server state machine to enter the HALTED state.

[-data-con-addr-type <address type>] - Data Server Connect Type

This field specifies the type of data connection established by the data server. The data connection can be established locally within a given system or between remote networked systems.

[-data-con-addr <text>] - Data Server Connect Address

This specifies the connection endpoint information for the data server's data connection.

[-data-con-port <integer>] - Data Server Connect Port

This specifies the TCP/IP port that the data server will use when establishing a data connection.

[-data-bytes-processed <integer>] - Data Bytes Processed

This field represents the cumulative number of data stream bytes transferred between the backup or recovery method and the data connection during the current data operation.

[-mover-state <component state>] - Mover State

This parameter identifies the current state of the NDMP tape server's mover state machine.

[-mover-mode <mover mode>] - Mover Mode

This parameter identifies the direction of the mover data transfer.

[-mover-pause-reason <pause reason>] - Mover Pause Reason

This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

[-mover-halt-reason <halt reason>] - Mover Halt Reason

This integer field identifies the event that caused the mover state machine to enter the HALTED state.

[-mover-record-size <integer>] - Mover Record Size

This field represents the current mover record size in bytes.

[-mover-record-num <integer>] - Mover Record Number

This field represents the last tape record processed by the mover.

[-mover-bytes-moved <integer>] - Mover Bytes Moved

This field represents the cumulative number of data stream bytes written to the data connection or the number of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode of mover operation.

[-mover-seek-position <integer>] - Mover Seek Position

This field represents the data stream offset of the first byte the DMA requested the mover to transfer to the data connection during a mover read operation.

[-mover-bytes-left-to-read <integer>] - Mover Bytes Left to Read

This field represents the number of data bytes remaining to be transferred to the data connection to satisfy the current NDMP_MOVER_READ request.

[-mover-window-offset <integer>] - Mover Window Offset

This field represents the absolute offset of the first byte of the mover window within the overall data stream.

[-mover-window-length <integer>] - Mover Window Length

This field represents the length of the current mover window in bytes.

[-mover-position <integer>] - Mover Position

This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-position should be an integer.

[-mover-setrecordsize-flag {true|false}] - Mover SetRecordSize Flag

This field is used by the DMA to establish the record size used for mover-initiated tape read and write operations.

[-mover-setwindow-flag {true|false}] - Mover SetWindow Flag

This flag represents whether a mover window has been set or not. A mover window represents the portion of the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

[-mover-con-addr-type <address type>] - Mover Connect Type

This field specifies the type of data connection established by the mover. The data connection can be established locally within a given system or between remote networked systems.

[-mover-con-addr <text>] - Mover Connect Address

This specifies the endpoint address or addresses that the mover will use when establishing a data connection.

[-mover-con-port <integer>] - Mover Connect Port

This specifies the TCP/IP port that the mover will use when establishing a data connection.

[-eff-host <host type>] - Effective Host

This field indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.

[-client-addr <text>] - NDMP Client Address

This parameter specifies the client's IP address.

[-client-port <integer>] - NDMP Client Port

This parameter specifies the client's port number.

[-spt-device-id <text>] - SCSI Device ID

This parameter specifies the SCSI device ID.

[-spt-ha <integer>] - SCSI Host Adapter

This parameter specifies the SCSI host adapter.

[-spt-scsi-id <integer>] - SCSI Target ID

This parameter specifies the SCSI target.

[-spt-scsi-lun <integer>] - SCSI LUN ID

This parameter specifies the SCSI LUN ID.

[-tape-device <text>] - Tape Device

This parameter specifies the name to identify the tape device.

[-tape-mode <mover mode>] - Tape Mode

This parameter specifies the mode in which tapes are opened.

[-is-secure-control-connection {true|false}] - Is Secure Control Connection

This parameter specifies whether the control connection is secure or not.

[-data-backup-mode <text>] - Data Backup Mode

This parameter specifies whether the mode of data backup is Dump or SMTape.

[-data-path <text>] - Data Path

This parameter specifies the path of data being backed up.

[-source-addr <text>] - NDMP Source Address

This parameter specifies the control connection IP address of the NDMP session.

Examples

The following example displays all the NDMP sessions on the cluster:

```
cluster1::> system services ndmp status
              Session
Node         Id
-----
node-01      17479
node-01      19769
node-02      21118
3 entries were displayed.
```

The following example shows how to display only the sessions running on node-01:

```
cluster1::> system services ndmp status -node node-01
              Session
Node         Id
-----
node-01      17479
node-01      19769
2 entries were displayed.
```

system services ndmp log commands

The log directory

system services ndmp log start

(DEPRECATED)-Start logging for the specified NDMP session

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "[vserver services ndmp log start](#)" on [page 2044](#)" command.

This command is used to start logging on an active NDMP session on a node. You can start logging two different kinds of sessions. The NDMP *server* session manages all NDMP tasks on the node. If you want to

log information regarding the NDMP server, use *server* with the `-session-id` parameter to enable logging. If you want to log information about a particular NDMP session, for example a restore operation, then determine the session ID for the session using the "system services ndmp status" command and use that ID with the `-session-id` parameter to enable logging.

Parameters

-node {<nodename>|local} - Node

This parameter specifies the node.

-session-id {<integer>|server} - Session Identifier

This parameter specifies the NDMP session-id on which logging needs to be started. The session-id is associated with a unique NDMP session. Specify *server* to start logging on the NDMP server session.

-filter <text> - Level Filter

Use this parameter to specify the filter for a particular session ID. This parameter controls the NDMP modules for which logging is to be enabled. This parameter can take five values. They are as follow : *all*, *none*, *normal*, *backend* or "*filter-expression*". The default value for this is *none*.

- *all* turns on logging for all modules.
- *none* disables logging for all modules.
- *normal* is a short cut parameter that enables logging for all modules except *verbose* and *io_loop*. The equivalent filter string is *all-verbose-io_loop*
- *backend* is a short cut parameter that enables logging for all modules except *verbose*, *io_loop*, *ndmps* and *ndmpp*. The equivalent filter string is *all-verbose-io_loop-ndmps-ndmpp*
- (*filter-expression*) is a combination of one or more modules for which logs needs to be enabled. Multiple module names can be combined using following operators :
 - - to remove the given module from the list of specified modules in the filter string. For example the filter *all-ndmpp* will enable logging for all modules but not *ndmpp*.
 - ^ to add the given module or modules to the list of modules specified in the filter string. For example the filter *ndmpp^mover^data* will enable logging for *ndmpp*, *mover* and *data*.

The possible module names and a brief description is given below:

+-----+ Modules Description +-----+	
verbose	verbose message
io	I/O process loop
io_loop	I/O process loop verbose messages
ndmps	NDMP service
ndmpp	NDMP Protocol
rpc	General RPC service
fdc_rpc	RPC to FC driver service
auth	Authentication
mover	NDMP MOVER (tape I/O)
data	NDMP DATA (backup/restore)
scsi	NDMP SCSI (robot/tape ops)
bkup_rpc	RPC to Backup service client
bkup_rpc_s	RPC to Backup service server
cleaner	Backup/Mover session cleaner
conf	Debug configure/reconfigure
dblade	Dblade specific messages
timer	NDMP server timeout messages
vldb	VLDB service
smf	SMF Gateway messages
vol	VOL OPS service

sv	SnapVault NDMP extension	
common	NDMP common state	
ext	NDMP extensions messages	
sm	SnapMirror NDMP extension	
ndmprpc	NDMP Mhost RPC server	
+-----+-----+		

Examples

The following example shows how to start logging on a specific NDMP session 33522, running on the node cluster1-01 with filter normal.

```
cluster1::*> system services ndmp log start -node cluster1-01 -session-id 33522 -filter normal
```

The following example shows how to start logging on the NDMP server session, on the node cluster1-01 with filter all.

```
cluster1::*> system services ndmp log start -session-id server -filter all -node cluster1-01
```

system services ndmp log stop

(DEPRECATED)-Stop logging for the specified NDMP session

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware " [vserver services ndmp log stop](#) " on [page 2046](#)" command.

This command is used to stop logging on an active NDMP session on a node. The NDMP *server* session manages all NDMP tasks on the node. If you want to stop logging information regarding the NDMP server, use *server* with the *-session-id* parameter to disable logging. If you want to stop logging information about a particular NDMP session, for example a restore operation, then determine the session ID for the session using the "system services ndmp status" command and use that ID with the *-session-id* parameter to disable logging.

Parameters

-node {<nodename>|local} - Node

This parameter specifies the node.

-session-id {<integer>|server} - Session Identifier

This parameter specifies the NDMP session-id on which logging needs to be stopped. The session-id is associated with a unique NDMP session. Specify *server* to stop logging on the NDMP server session.

Examples

The following example shows how to stop logging on a specific NDMP session 35512, running on node cluster1-01.

```
cluster1::*> system services ndmp log stop -session-id 35512 -node cluster1-01
```

The following example shows how to stop logging on the NDMP server session, running on node cluster1-01.

```
cluster1::*> system services ndmp log stop -session-id server -node cluster1-01
```

system services ndmp node-scope-mode commands

The node-scope-mode directory

Note: These node-scoped NDMP commands are deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware " ["vserver services ndmp" on page 2022](#)" commands.

system services ndmp node-scope-mode off

(DEPRECATED)-Disable NDMP node-scope-mode

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware " ["vserver services ndmp" on page 2022](#)" command.

This command puts NDMP server in Vserver-aware mode. The Vserver-aware commands are available under ["vserver services ndmp" on page 2022](#).

Examples

The following example shows how to disable the node-scope-mode of NDMP server.

```
cluster1::> system services ndmp node-scope-mode off
NDMP node-scope-mode is disabled.
```

system services ndmp node-scope-mode on

(DEPRECATED)-Enable NDMP node-scope-mode

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware " ["vserver services ndmp" on page 2022](#)" command.

This command puts the NDMP server in the node-scope-mode. In the node-scope-mode, NDMP server has the following behavior:

- All NDMP operations are restricted to resources on the node
- Vserver-aware NDMP commands are disabled
- NDMP authentication falls back to DATA ONTAP 8.1 NDMP authentication scheme

Examples

The following example enables node-scope-mode of operation :

```
cluster1::> system services ndmp node-scope-mode on
NDMP node-scope-mode is enabled.
```

system services ndmp node-scope-mode status

(DEPRECATED)-Status of NDMP node-scope-mode

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware " [vserver services ndmp](#) on page 2022" command.

This command displays whether the NDMP server is operating in node-scope-mode or not.

- NDMP node-scope-mode is disabled - NDMP server is Vserver-aware
- NDMP node-scope-mode is enabled - NDMP server is node scoped

Examples

The following example shows how to check the status of NDMP server in a cluster

```
cluster1::> system services ndmp node-scope-mode status
NDMP node-scope-mode is disabled.
```

system services ndmp service commands

The service directory

system services ndmp service modify

Modify NDMP service configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system services ndmp service modify` command allows you to modify the NDMP service configurations for a node in the cluster. The following configuration can be modified:

- NDMP Common Sessions

This command is not supported on Infinite Volumes.

Parameters

-node {<nodename>|local} - Node

This specifies the node whose NDMP configuration is to be modified.

[-common-sessions <integer>] - NDMP Common Sessions

This optional parameter specifies the number of extra common NDMP sessions supported, in addition to the number of backup and restore sessions supported for a platform. The default value is 4 for all platforms. The number of backup and restore sessions are platform dependent.

CAUTION:

Increasing this parameter can make the storage system unresponsive.

Examples

The following example modifies the NDMP configuration on a node named node1. The configuration sets the NDMP Common Sessions to 16:

```
cluster1::> system services ndmp modify -node node1
-common-sessions 16
```

system services ndmp service show

Display NDMP service configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system services ndmp service show` command displays the following information about the NDMP service configuration across all the nodes in the cluster:

- Node name
- NDMP Common Sessions

A combination of parameters can be optionally supplied to filter the results based on specific criteria. This command is not supported on Infinite Volumes.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects information about the specified node.

[-common-sessions <integer>] - NDMP Common Sessions

Selects information about the nodes that have the specified number of NDMP common sessions.

Examples

The following example displays information about the NDMP configuration of all nodes in the cluster:

```
cluster1::> system services ndmp service show
Node           Common Sessions
-----
node0           16
node1           16
node2           16
node3           16
4 entries were displayed.
```

system services ndmp service start

Start the NDMP service

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system services ndmp service start` command starts the NDMP service daemon for a node. This is different from the [“system services ndmp on” on page 1265](#) command. The [“system services ndmp on” on page 1265](#) command enables the daemon to accept NDMP requests. The NDMP service daemon starts automatically on a node when it boots up. Use this command to start the NDMP service daemon that has been stopped by the [“system services ndmp service stop” on page 1280](#) command. This command is not supported on Infinite Volumes.

Parameters

-node {<nodename>|local} - Node

The node on which the NDMP service needs to be started.

Examples

```
cluster1::*> system services ndmp service start -node node0
```

system services ndmp service stop

Stop the NDMP service

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system services ndmp service stop` command stops the NDMP service daemon on a node. This is a disruptive command and should not be used in normal scenarios. Processing of active sessions continues but the ability to view or kill sessions is lost. This is different from the [“system services ndmp off” on page 1264](#) command. The [“system services ndmp off” on page 1264](#) command disables new NDMP connections on the node but does not stop the NDMP service daemon. This command is not supported on Infinite Volumes.

Parameters

-node {<nodename>|local} - Node

The node on which the NDMP service needs to be stopped.

Examples

```
cluster1::*> system services ndmp service stop -node node0
```

system services ndmp service terminate

Terminate all NDMP sessions

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system services ndmp service terminate` command terminates all active sessions on the node. This command forcefully terminates all NDMP sessions without an opportunity for a graceful shutdown. Use [“system services ndmp kill-all” on page 1263](#) for a clean termination of all active sessions on a node. This command is not supported on Infinite Volumes.

Parameters

-node {<nodename>|local} - Node

The node on which the NDMP sessions need to be terminated

Examples

```
cluster1::*> system services ndmp service terminate -node node0
```

Manage Web Protocols

Manage web protocols

These commands manage the availability of web protocols (HTTP/HTTPS) in the cluster, including the port and encryption configurations for those protocols.

system services web modify

Modify the cluster-level configuration of web protocols

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command modifies the overall availability of web services in the cluster, including the core protocol configurations for those services. In a pre-root or unclustered scenario, its scope applies to the local node.

Parameters

[-external {true|false}] - External Web Services

Defines whether remote clients can access HTTP or HTTPS service content. Along with the [“system services firewall” on page 1254](#) configuration, this parameter controls the visibility for client connections. The default value for this parameter after installation is 'true', which exports web protocols for remote access. If no value is provided during modification, its behavior does not change.

[-per-address-limit <integer>] - Per Address Limit (privilege: advanced)

Limits the number of connections that can be processed concurrently from the same remote address. If more connections are accepted, those in excess of the limit are delayed and processed after the number of connections being processed drops below the limit. The default value is 96.

[-http-enabled {true|false}] - HTTP Enabled (privilege: advanced)

Defines whether HTTP is enabled. The default value for this parameter is *false*.

Examples

The following command changes the maximum size of the wait queue:

```
cluster1::> system services web modify -wait-queue-capacity 256
```

system services web show

Display the cluster-level configuration of web protocols

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the overall availability of web services in the cluster, including the core protocol configurations for those services. In a pre-root or unclustered scenario, its output applies to the local node. The following information explains the External Web Services and Status attributes, two features of web services' availability.

The External Web Services field indicates whether remote clients are allowed to access the HTTP or HTTPS service content. Along with the [“system services firewall” on page 1254](#) configuration, the External Web Services field indicates the visibility for client connections.

The Status field describes the aggregated operational state of cluster-level web services as retrieved from the [“system services web node” on page 1282](#) command. The Status field does not reflect whether the protocols are externally visible, but whether the server processes are running correctly. For detailed information about individual servers, use the [“system services web node show” on page 1282](#) command. The following are the possible values for the Status in node configuration or availability:

- online, all web services are consistently configured and working correctly.
- partial, one or more nodes' web services are unavailable due to an error condition.
- mixed, the nodes in the cluster do not share the same web services configuration. This situation might occur if individual nodes were reconfigured with the [“system services web node” on page 1282](#) command.
- offline, all of the nodes' web services are unavailable due to an error condition.
- unclustered, the current node is not part of an active cluster.

The HTTP Enabled field indicates whether HTTP is enabled.

The per-address-limit field is the limit of the number of connections that can be processed concurrently from the same remote address. If more connections are accepted, those in excess of the limit are delayed and processed after the number of connections being processed drops below the limit.

Examples

The following example displays the availability of web services for the cluster.

```
cluster1::> system services web show
External Web Services: true
                    Status: online
    HTTP Protocol Port: 80
    HTTPS Protocol Port: 443
        HTTP Enabled: true
```

Manage Node Web Servers

Manage the nodes' web servers

These commands manage the availability of web protocols (HTTP/HTTPSs) on specific nodes in the cluster, including the port and encryption configurations for those protocols.

system services web node show

Display the status of the web servers at the node level

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays operational configuration for the web server processes on the nodes in the cluster. This output is aggregated to produce the content for the [“system services web show” on page 1281](#) command.

Parameters

[**-fields** <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the nodes that match this parameter value. Identifies the node where the web server process is being executed.

[-external {true|false}] - External Web Services

Selects the nodes that match this parameter value. Defines whether remote clients can access the HTTP or HTTPS service content. Along with the [“system services firewall” on page 1254](#) command configuration, this parameter controls the visibility for client connections. The default value for this parameter after installation is *true*, which exports web protocols for remote access.

[-http-port <integer>] - HTTP Port

Selects the nodes that match this parameter value. Defines the HTTP port for the node-level web services.

[-https-port <integer>] - HTTPS Port

Selects the nodes that match this parameter value. Defines the encrypted HTTP (HTTPS) port for the node-level web services.

[-http-enabled {true|false}] - HTTP Enabled

Selects the nodes that match this parameter value. Defines whether HTTP is enabled.

[-per-address-limit <integer>] - Per Address Limit (privilege: advanced)

Selects the nodes that match this parameter value. Limits the number of connections that can be processed concurrently from the same remote address. If more connections are accepted, those in

excess of the limit are delayed and processed after the number of connections being processed drops below the limit.

[-status {offline|partial|mixed|online|unclustered}] - Protocol Status

Selects the nodes that match this parameter value. Describes the operational state of node-level web services. This parameter does not reflect whether protocols are externally visible, but whether the server processes are running correctly. The following are the possible values that describe the service availability:

- online, indicates that web services are working correctly.
- offline, indicates that web services are unavailable due to an error condition.
- unclustered, indicates that the current node is not part of an active cluster.

[-total-hits <integer>] - Total HTTP Requests

Selects the nodes that match this parameter value. Indicates the total number of requests serviced by the web server.

[-total-bytes <integer>] - Total Bytes Served

Selects the nodes that match this parameter value. Indicates the total number of bytes returned by the web server.

Examples

The following example displays the status of web servers for nodes in the cluster.

```
cluster1::system services web node> show
Node      HTTP External HTTP Port HTTP Port Status Total HTTP Requests Total Bytes Served
-----
node1     true  true   80   443 online      5      1362
node2     true  true   80   443 online      5      1362
2 entries were displayed.
```

SMTape Commands

Manage SMTape operations

smtape commands description

system smtape abort

Abort an active SMTape session

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command aborts the backup or restore operations based on the session identifier. You can perform SMTape operations using the [“system smtape backup” on page 1284](#) or [“system smtape restore” on page 1286](#) commands. A unique session identifier is assigned for each new SMTape operation. This command aborts sessions that are in active and waiting states.

Parameters

-session <Sequence Number> - Session Identifier

Use this parameter to specify the session identifier for a backup or restore session.

Examples

Abort the SMTape session with the session identifier 20

```
cluster1::> system smtape abort -session 20
```

Abort posted to session 20.

system smtape backup

Backup a volume to tape devices

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command performs a baseline backup of a specified volume path to a tape device. You can use the command `system hardware tape drive show` to view the list of tape devices in the cluster. You must specify a Snapshot copy name to perform an SMTape backup operation. The Snapshot copy name specified is used as the base Snapshot copy. A new unique session ID is assigned for this SMTape operation and the status of the session can be monitored using the command [“system smtape status” on page 1288](#). This session ID can be subsequently used to perform other operations such as to find the SMTape status, abort an SMTape operation, and continue an SMTape operation.

The volume and tape device must reside on the same node in the cluster. You must retain the base Snapshot copy created during this backup operation in order to use this Snapshot copy to re-establish a SnapMirror relationship upon a restore.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver name on which the volume is located. You need not specify this parameter if only one cluster Vserver exists.

-volume <volume name> - Volume Name

Use this parameter to specify the name of the volume that needs to be backed up to tape.

-backup-snapshot <snapshot name> - Snapshot Name

Use this parameter to specify the name of the Snapshot copy while performing an SMTape backup operation.

-tape </node_name/tape_device> - Tape Name

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is `/node_name/tape_device`, where `node_name` is the name of the cluster node owning the tape and `tape_device` is the name of the tape device.

[-tape-block-size <integer>] - Tape Record Size in KB

Use this parameter to specify the tape record size in KB for backup and restore operations. The tape record size is in multiples of 4KB, ranging from 4KB to 256KB. The default tape record size is 240KB unless it is specified.

Examples

The following example will start the backup of a volume *datavol* in a Vserver *vserver0* to a tape *rst0a*. Both the volume and tape reside on the same node *cluster1-01*. The Snapshot copy to be backed up is *datavol_snapshot* and the tape record size has the value of 256KB.

```
cluster1::> system smtape backup -vserver vserver0 -volume datavol  
-backup-snapshot datavol_snapshot -tape /cluster1-01/rst0a  
-tape-block-size 256
```

Session 21 created successfully

The following example will start the backup of a volume *datavol* in a Vserver *vserver0* to a tape *rst0a*. The volume *datavol* is in a Vserver *vserver0*. Both the volume and tape reside on the same node *cluster1-01*. The Snapshot copy to be backed up is *datavol_snapshot* and the tape record size has the default value of 240KB.

```
cluster1::> system smtape backup -vserver vserver0 -volume datavol
-backup-snapshot datavol_snapshot -tape /cluster1-01/nrst0l
```

Session 22 created successfully

system smtape break

Make a restored volume read-write

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command breaks the relationship between the tape backup of a volume and a restored volume, changing the restored volume from read-only to read/write.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver name on which the volume is located. You need not specify this parameter if only one cluster Vserver exists.

-volume <volume name> - Volume Name

Use this parameter to specify the name of the read-only volume that needs to be made read/writeable after a restore.

Examples

Make the read-only volume *datavol* on Vserver *vserver0* writeable after a restore.

```
cluster1::> system smtape break -vserver vserver0 -volume datavol
[Job 84] Job succeeded: SnapMirror Break Succeeded
```

system smtape continue

Continue SMTape session waiting at the end of tape

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command continues the SMTape backup and restore operations using the specified tape device. You can use this command when an SMTape operation has reached the end of current tape and is in the wait state to write to or read from a new tape.

If a tape device is not specified, the original tape device will be used.

User has to make sure that the correct tape media is inserted in the device and positioned appropriately before issuing this command.

Parameters

[-tape </node_name/tape_device>] - Tape Name

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is */node_name/tape_device*, where *node_name* is the name of the cluster node owning the tape and *tape_device* is the name of the tape device.

-session <Sequence Number> - Session Identifier

Use this parameter to specify the session identifier for the SMTape backup or restore operations.

Examples

Continues an SMTape session having session ID *20* on tape device *rst0a* on the node *node1* in the cluster.

```
cluster1::> system smtape continue -session 20 -tape /node1/rst0a
continue on session 20 succeeded
```

The following example continues session *40* on the same tape device that was being used by the session.

```
cluster1::> system smtape continue -session 40
continue on session 40 succeeded
```

system smtape restore

Restore a volume from tape devices

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command performs restore of a backup image created using the command [“system smtape backup” on page 1284](#) in the specified tape device to a destination volume path. A new unique session ID is assigned for this operation; the status of the session can be monitored using the command [“system smtape status” on page 1288](#). It is required that the volume and tape device reside in the same cluster node. The volume must be of type DP (Data Protection) and should be placed in the restricted mode prior to a restore. Any existing data on the volume will get overwritten upon a restore. The volume will remain as read-only and of type DP after the restore. You can use the command [“system smtape break” on page 1285](#) to get read/write permissions on the volume. Restore to an Infinite Volume is not supported. Restore can be done to a non-root DP volume.

Parameters**-vserver <vserver name> - Vserver Name**

Use this parameter to specify the Vserver name on which the volume is located. You need not specify this parameter if only one cluster Vserver exists.

-volume <volume name> - Volume Name

Use this parameter to specify the volume name on which the tape content will be restored.

-tape </node_name/tape_device> - Tape Name

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is */node_name/tape_device*, where *node_name* is the name of the cluster node owning the tape and *tape_device* is the name of the tape device.

[-tape-block-size <integer>] - Tape Record Size in KB

Use this parameter to specify the tape record size in KB for backup and restore operations. The tape record size is in multiples of 4KB, ranging from 4KB to 256KB. The default tape record size is 240KB unless it is specified. Use the same record size which was used during the backup. If the tape record size is different from the tape record size that was used at the time of backup then `system smtape restore` will fail.

Examples

The following example will start the restore to a volume *datavol* from a tape *rst0a*. The volume *datavol* is in a Vserver *vserver0*. Both *vserver0* and *rst0a* reside on the same node *cluster1-01*.

```
cluster1::> system smtape restore -vserver vserver0 -volume datavol
-tape /cluster1-01/rst0a -tape-block-size 256
```

Session 2 created successfully

The following example will start the restore to a volume *datavol* from a tape *rst0a*. The volume *datavol* is in a Vserver *vserver0*. Both *vserver0* and *rst0a* reside on the same node *cluster1-01*. The default tape record size of 240KB was used during backup.

```
cluster1::> system smtape restore -vserver vserver0 -volume datavol  
-tape /cluster1-01/rst0a
```

Session 5 created successfully

system smtape showheader

Display SMTape header

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the image header of a tape. The tape must have a valid backup of data. The following information about the backup is displayed:

- Tape Number - the tape number if the backup spans multiple tape devices.
- WAFL Version - WAFL version of the storage system when the volume was backed up on tape.
- Backup Set ID - a unique backup set ID for the baseline backup.
- Source Storage System - the source storage system where the volume resided when the backup was performed.
- Source Volume - the source volume that was backed up to tape.
- Source Volume Capacity - the capacity of the source volume that was backed up to tape.
- Source Volume Used Size - the used size of the source volume that was backed up to tape.
- Source Snapshot - name of the Snapshot copy used for the backup.
- Volume Type - type of the volume.
- Is SIS Volume - this field is true if the backed up volume was a SIS volume.
- Backup Version - the SMTape backup version.
- Backup Sequence No - the backup sequence number.
- Backup Mode - this field describes the backup mode.
- Time of Backup - the time at which the backup was performed.
- Time of Previous Backup - the time at which the previous backup was performed; this information is displayed only if the previous backup was an incremental backup.
- Volume Total Inodes - number of inodes of the backed up volume.
- Volume Used Inodes - number of used inodes of the backed up volume.
- Number of Snapshots - number of Snapshot copies present in this backup.
- Snapshot ID - is the Snapshot ID of the backup Snapshot.
- Snapshot Time - time at which the backup Snapshot copy was created.
- Snapshot Name - name of the Snapshot copy which was backed up to tape.

Parameters

-tape </node_name/tape_device> - **Tape Name**

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is `/node_name/tape_device`, where `node_name` is the name of the cluster node owning the tape and `tape_device` is the name of the tape device.

[-tape-block-size <integer>] - Tape Record Size in KB

Use this parameter to specify the tape record size in KB for backup and restore operations. The tape record size is in multiples of 4KB, ranging from 4KB to 256KB. The default tape record size is 240KB unless it is specified.

Examples

The following example reads the image header from the tape `nrst0l` residing on the node `cluster1-01` and displays relevant tape header information.

```
cluster1::> system smtape showheader -tape /cluster1-01/nrst0l
-tape-block-size 240

Tape record size in KB: 240
  Tape Number: 1
  WAFL Version: 23577
  Backup Set ID: 7d0c9a15-8e20-11e1-8741-123478563412
Source Storage System: cluster1-01
Source Volume: /vs1/srcvol
Source Volume Capacity: 400.00MB
Source Volume Used Size: 0.00
Source Snapshot: mysnap
  Volume Type: Flex
  Is SISVolume: no
  Backup Version: 1:3
Backup Sequence No: 0
  Backup Mode: dw-data
  Time of Backup: 4/24/2012 15:16:38
Time of Previous Backup: 0/0/0 00:00:00
Volume Total Inodes: 12789
Volume Used Inodes: 100
Number of Snapshots: 1
  Snapshot ID: 1
  Snapshot Time: 4/24/2012 15:16:10
  Snapshot Name: mysnap
```

system smtape status commands

The status directory

system smtape status clear

Clear SMTape sessions

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command clears SMTape sessions which are completed, failed or Unknown state.

Parameters

[-session <Sequence Number>] - Session Identifier

Use this parameter to clear the SMTape sessions with the specified session identifier.

[-node {<nodename>|local}] - Node Name

Use this parameter to clear the SMTape sessions related to the specified node.

[-type {backup|restore}] - Operation Type

Use this parameter to clear the SMTape sessions of the specified operation type. These can be either backup or restore sessions.

[-status {COMPLETED|FAILED|UNKNOWN}] - Session Status

Use this parameter to clear the SMTape sessions which have the status as specified in the parameter.

[-path <text>] - Path Name

Use this parameter to clear the SMTape sessions which have path as specified in the parameter.

[-device <text>] - Device Name

Use this parameter to clear the SMTape sessions on a specific tape device.

[-backup-snapshot <snapshot name>] - Snapshot Name

Use this parameter to clear the SMTape sessions using the Snapshot copy name as specified in the parameter.

[-tape-block-size <integer>] - Tape Block Size

Use this parameter to clear the SMTape sessions with the tape block size as specified in the parameter.

Examples

The following example clears all the completed SMTape sessions in the cluster:

```
cluster1::> system smtape status clear  
5 sessions are purged.
```

The SMTape sessions on the node *node1* in the cluster are cleared.

```
cluster1::> system smtape status clear -node node1  
3 sessions are purged.
```

system smtape status show

Show status of SMTape sessions

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command lists the status of all SMTape sessions in the cluster. By default, this command lists the following information:

- Session
- Type
- Status
- Progress
- Path
- Device
- Node

Parameters

{ [-fields <fieldname>, ...]

Use this parameter to display additional fields about each session apart from the default entries. This parameter is optional. Any combination of the following fields is valid:

- Session
- Node
- Type
- Status

- Path
- Device
- Progress
- Start-time
- End-time
- Update-time
- Backup-snapshot
- Tape-block-size
- Error

| [-instance]}

Displays detailed information about the specified sessions.

[-session <Sequence Number>] - Session Identifier

Selects information about a specific SMTape session. A Session Identifier is a number that is used to identify a particular SMTape session.

[-node {<nodename>|local}] - Node Name

Selects information about sessions related to the specified node.

[-type {backup|restore}] - Operation Type

Selects information about SMTape sessions of the specified operation type.

[-status {COMPLETED|FAILED|ACTIVE|WAITING|ABORTING|UNKNOWN}] - Session Status

Selects information about SMTape sessions having the specified status in the parameter.

[-path <text>] - Path Name

Selects information about SMTape sessions on a volume which is at the specified path name. This is the logical path of the volume and you must specify the path name in the following format: /vserver_name/volume_name.

[-device <text>] - Device Name

Selects information about the SMTape sessions on the specified tape device. You must specify the tape device name in the following format: /node_name/tape_device.

[-progress {<integer>[KB|MB|GB|TB|PB]}] - Bytes Transferred

Selects information about SMTape sessions in which the number of data bytes transferred in a particular session matches with the number specified in this parameter.

[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time

Selects information about SMTape sessions whose starting time matches the specified starting time.

[-end-time <MM/DD/YYYY HH:MM:SS>] - End Time

Selects information about SMTape sessions whose ending time matches the specified ending time.

[-backup-snapshot <snapshot name>] - Snapshot Name

Selects information about SMTape sessions that use a particular Snapshot copy name which matches the specified Snapshot copy name in the parameter in backup or restore operations.

[-tape-block-size <integer>] - Tape Block Size

Selects information about SMTape sessions that use a particular tape block size which matches the specified tape block size parameter in backup or restore operations.

[-error <text>] - Error Description

Selects information about SMTape sessions that have a particular error description which matches the specified error description in the parameter.

Examples

Displays default entries about the five SMTape sessions.

```
cluster1::> system smtape status show
```

Session	Type	Status	Progress	Path	Device	Node
5	Backup	COMPLETED	50MB	/vsrvr1/vol1	/cls1-01/nrst0l	cluster1-01
4	Restore	FAILED	0B	/vsrvr1/vol3	/cls1-02/nrst2l	cluster1-02
3	Backup	COMPLETED	50MB	/vsrvr1/vol3	/cls1-01/nrst0l	cluster1-01
2	Backup	COMPLETED	50MB	/vsrvr1/vol2	/cls1-03/nrst0m	cluster1-03
1	Backup	COMPLETED	50KB	/vsrvr1/vol5	/cls1-01/nrst0n	cluster1-01

5 entries were displayed.

The following example shows the output with the `-instance` argument.

```
cluster1::> system smtape status show -instance
```

```
Session Identifier: 1
  Node Name: node1
  Operation Type: Backup
    Status: COMPLETED
    Path Name: /vs1/vol1
    Device Name: /node1/rst0a
  Bytes Transferred: 2048
    Start Time: 1/4/2012 14:26:24
    End Time: 1/4/2012 14:29:45
    Last updated: 1/4/2012 14:29:45
    Snapshot Name: vol1.snapshot
    Tape Block Size: 240
    Error Description: None
```

system status commands

System Status service

Display the ONTAP system status.

system status show

Display System Status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system status show` command displays information about the status of objects in Data ONTAP. You can limit output to specific types of information and specific status in Data ONTAP, or filter output by specific field values.

To see a list of values that are in use for a particular field, use the `-fields` parameter of this command with the list of field names you wish to view.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-internal-name <text>] - Internal Full Name

Selects status of objects that match this parameter value.

[-name <text>] - Name

Selects status of objects that match this parameter value.

[-vserver-id <text>] - Vserver ID

Selects status of objects that match this parameter value.

[-cluster-id <text>] - Cluster ID

Selects status of objects that match this parameter value.

[-is-cluster-scope {true|false}] - Cluster Scope

Selects status of objects that match this parameter value.

[-status <text>] - Status Value

Use this parameter to display the status.

[-update-time <MM/DD/YYYY HH:MM:SS>] - Update Time

Use this parameter to display the status last update time.

Examples

```
cluster1::> system status show
Cluster:tfarrellnscluster-1
Node:tfarrell-vsim1
Hypervisor system name:vsimesxrtp060.gdl.englab.netapp.com

system snmp commands

The snmp directory

Manage cluster-wide SNMP settings. SetRequest PDU is not supported. There is no default community for the SNMP agent. SNMPv3 users are created using "security login create" CLI.

system snmp authtrap

Enables or disables SNMP authentication traps

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Use this command to either enable or disable the standard SNMP authentication failure traps.

Parameters

[-authtrap <integer>] - Enables SNMP Authentication Trap

Enter the value of 1 to enable SNMP authentication failure traps. By default, SNMP authentication trap is disabled and the value is 0.

Examples

The following example demonstrates how to set the SNMP authtrap.

```
cluster1::> system snmp authtrap -authtrap 1
```

```
cluster1::> system snmp show
contact:
    private
location:
    NB
authtrap:
    1
init:
    0
traphosts:
    -
community:
    - -
```

system snmp contact

Displays or modifies contact details

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Sets the contact name as the System.sysContact.0 MIB-II variable.

Parameters

[-contact <text>] - Contact

Specifies the contact name. Without any value specified, this command displays current setting of contact name.

Examples

The following example sets the contact name for SNMP.

```
cluster1::> system snmp contact -contact private

cluster1::> system snmp show
contact:
    private
location:
    NB
authtrap:
    1
init:
    0
traphosts:
    -
community:
    - -
```

system snmp enable-snmpv3

Enables SNMPv3 cluster-wide

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system snmp enable-snmpv3` command enables SNMPv3 server on the entire cluster. When this command is run, SNMP users and SNMP traphosts that are non-compliant to FIPS will be deleted automatically, since cluster FIPS mode is enabled. Any SNMPv1 user, SNMPv2c user or SNMPv3 user (with none or MD5 as authentication protocol or none or DES as encryption protocol or both) is non-compliant to FIPS. Any SNMPv1 traphost or SNMPv3 traphost (configured with an SNMPv3 user non-compliant to FIPS) is non-compliant to FIPS.

Examples

The following command enables SNMPv3 server on the entire cluster, within a cluster named cluster1:

```
cluster1:: set -privilege advanced

Warning: These advanced commands are potentially dangerous; use them only when
        directed to do so by NetApp personnel.
Do you want to continue? [y/n]: y

cluster1::* system snmp enable-snmpv3

Warning: If you enable SNMPv3 using this command, any SNMP users and
        SNMP traphosts that are non-compliant to FIPS will be
        deleted automatically, since cluster FIPS mode is enabled.
        Any SNMPv1 user, SNMPv2c user or SNMPv3 user (with none or
        MD5 as authentication protocol or none or DES as encryption
        protocol or both) is non-compliant to FIPS. Any SNMPv1
        traphost or SNMPv3 traphost (configured with an SNMPv3 user
        non-compliant to FIPS) is non-compliant to FIPS.
Do you want to continue? [y/n]: y

1 entry was modified.

cluster1::*
```

system snmp init

Enables or disables SNMP traps

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Initializes or disables sending of traps by the SNMP daemon from the cluster.

Parameters

[-init <integer>] - Initialize Traps

Use the value of 1 to initialize SNMP daemon to send traps or use a value of 0 to stop sending traps from the cluster. If no value is specified, this command displays the current setting of init. Traps are enabled by default.

Examples

The following command initializes SNMP daemon to send traps.

```
cluster1::> system snmp init -init 1

cluster1::> system snmp show
contact:
    private
location:
    NB
authtrap:
    1
init:
    1
traphosts:
    -
community:
    -
```

system snmp location

Displays or modifies location information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Sets the location name as the System.sysLocation.0 MIB-II variable.

Parameters

[-location <text>] - Location

Specifies the location details. If no value is specified, this command displays the current setting of location.

Examples

This command sets the location name.

```
cluster1::> system snmp location -location NB

cluster1::> system snmp show
contact:
    private
location:
    NB
authtrap:
    1
init:
    1
traphosts:
    -
community:
    -
```

system snmp prepare-to-downgrade

Change SNMP configuration to the default settings for releases earlier than Data ONTAP 9.3.0

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `system snmp prepare-to-downgrade` command prepares the SNMP subsystem for a downgrade or a revert. More specifically, it prepares the SNMPv3 client feature for a downgrade or a revert. It deletes all storage switches that were explicitly added for monitoring and are using SNMPv3 as the underlying protocol. It also deletes any cluster switches that are using SNMPv3 for monitoring. Finally, it deletes any remote switch SNMPv3 users configured in ONTAP.

Examples

The following command prepares the SNMP subsystem for a downgrade or a revert, within a cluster named `cluster1`:

```
cluster1::> system snmp prepare-to-downgrade
```

system snmp show

Displays SNMP settings

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Lists the current values of all the SNMP parameters.

Examples

The example below shows a typical command display.

```
cluster1::> system snmp show
contact:
    private
location:
    NB
authtrap:
    1
init:
    1
traphosts:
    xxx.example.com(192.168.xxx.xxx)
community:
    -
```

system snmp community commands

The community directory

Adds, deletes and displays communities.

system snmp community add

Adds a new community with the specified access control type

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system snmp community add` command adds communities with the specified access control type. Only read-only communities are supported. There is no limit for the number of communities supported.

Parameters

-vserver <Vserver Name> - Vserver

This parameter specifies the Vserver to which the community will be added. If no Vserver is specified, the community is added to the admin Vserver.

-community-name <text> - Community

This parameter specifies the name of the community.

-type <ctype> - access type

This parameter specifies 'ro' for read-only community.

Examples

The following example adds the read-only community name 'private'.

```
cluster1::> system snmp community add -type ro
-community-name private

cluster1::> system snmp community show
ro private
```

system snmp community delete

Deletes community with the specified access control type

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system snmp community delete` command deletes communities with the specified access control type. Only read-only communities are supported.

Parameters

-vserver <Vserver Name> - Vserver

This parameter specifies the Vserver from which you wish to delete the community. If no Vserver is specified, the community is deleted from the admin Vserver.

-community-name <text> - Community

Specify the name of the community.

-type <ctype> - access type

Specify 'ro' for a read-only community.

Examples

The following example deletes the read-only community 'private':

```
cluster1::> system snmp community delete -type ro
-community-name private

cluster1::> system snmp community show
This table is currently empty.
```

system snmp community show

Displays communities

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Displays the current list of SNMP communities.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver

Selects the Vserver to which the SNMP community belongs

[-community-name <text>] - Community

Selects the SNMP v1/v2c community string

[-access <ctype>] - access

Selects the access type of the SNMP v1/v2c community. Read-only (ro) is the only access type supported

Examples

```
cluster1::> system snmp community show
```

```
cluster1  
ro private
```

system snmp traphost commands

The traphost directory

Adds, deletes and displays SNMP managers.

system snmp traphost add

Add a new traphost

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Adds the SNMP manager who receives the SNMP trap PDUs. The SNMP manager can be a hostname or IP address. There is no limit on the number of traphosts supported.

Parameters

-peer-address <Remote InetAddress> - Remote IP Address

Specifies the IP address or hostname of the traphost. If the USM user is associated, then the SNMPv3 traps are generated for this traphost using the associated USM user's authentication and privacy credentials. If no USM user is associated, then the SNMP v1/v2c traps are generated for this traphost. For the SNMP v1/v2c traps, the default community string is 'public', when no community is defined. When the community strings are defined, then the first community string is chosen for the SNMP v1/v2c traps.

[-usm-username <text>] - USM User Name

Specifies a predefined SNMPv3 USM user. The SNMPv3 traps are generated using this USM user's authentication and privacy credentials for the traphost identified by the `peer-address` parameter.

Examples

In the following example, the command adds a hostname 'yyy.example.com' for the SNMPv3 traps:

```
cluster1::> system snmp traphost add -peer-address yyy.example.com -usm-username MyUsmUser

cluster1::> system snmp traphost show
      yyy.example.com(yyy.example.com)(192.168.xxx.xxx)    USM User: MyUsmUser
```

In the following example, the command adds a hostname 'xxx.example.com' for the SNMP v1/v2c traps:

```
cluster1::> system snmp traphost add xxx.example.com

cluster1::> system snmp traphost show
      yyy.example.com(yyy.example.com)(192.168.xxx.xxx)    USM User: MyUsmUser
      xxx.example.com(yyy.example.com)(xxx.xxx.xxx.xxx)    Community: public
```

system snmp traphost delete

Delete a traphost

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Deletes the SNMP manager, who receives the SNMP trap PDUs. The SNMP manager can be a hostname or IP address. There is no limit on the number of traphosts supported.

Parameters

-peer-address <Remote InetAddress> - Remote IP Address

Specifies the IP address or hostname of the traphost. If the USM user is associated, then specify the USM user to delete the traphost.

[-usm-username <text>] - USM User Name

Specifies the USM user associated with traphost.

Examples

In the following example, the command deletes the SNMPv3 traphost 'yyy.example.com' associated with the USM user:

```
cluster1::> system snmp traphost delete -peer-address yyy.example.com -usm-username MyUsmUser
```

In the following example, the command deletes the SNMP v1/v2c traphost 'xxx.example.com' associated with a community string:

```
cluster1::> system snmp traphost delete -peer-address xxx.example.com
```

system snmp traphost show

Displays traphosts

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Displays list of the SNMP v1/v2c and SNMP v3 managers, that receive trap PDUs.

Examples

In the following example, the command displays all the host names or IP addresses that have been added until now:

```
cluster1::> system snmp traphost show
      yyy.example.com(yyy.example.com)(192.168.xxx.xxx)    USM User: MyUsmUser
      xxx.example.com(yyy.example.com)(xxx.xxx.xxx.xxx)    Community: public
```

system timeout commands

Manage the timeout value for CLI sessions

system timeout modify

Set the CLI inactivity timeout value

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system timeout modify` command sets the timeout value for CLI sessions. If there is no CLI activity during the length of the timeout interval, the logged in user is logged out. The default value is 30 minutes. To prevent CLI sessions from timing out, specify a value of 0 (zero).

Parameters

[-timeout <integer>] - Timeout (in minutes)

Use this parameter to specify the timeout value, in minutes.

Examples

The following example shows how to modify the timeout value for CLI sessions to be 10 minutes:

```
cluster1::> system timeout modify -timeout 10
```

The following example shows how to prevent CLI sessions from timing out:

```
cluster1::> system timeout modify -timeout 0
```

system timeout show

Display the CLI inactivity timeout value

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system timeout show` command displays the timeout value for CLI sessions. If there is no CLI activity during the length of the timeout interval, the logged in user is logged out. A timeout value of 0 minutes means that the CLI sessions never time out.

Examples

The following example displays the timeout value for CLI sessions:

```
cluster1::> system timeout show  
CLI session timeout: 15 minute(s)
```

Chapter 27. Template Commands

The Templates directory

The `template` commands enable you to manage Templates and their parameters.

template copy

Copy a template

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Use this command to copy an existing template. The copied template becomes a readwrite template and can be customized using template parameter family of commands.

Parameters

-name <template name> - Name of the template

This parameter specifies the name of the template.

-destination-name <template name> - Destination template

This parameter specifies the name of the destination template.

Examples

The following example copies template1 to template2. The template2 will be a readwrite template:

```
cluster1::> template copy -name template1 -destination-name template2
```

template delete

Delete an existing template

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Use this command to delete an existing template.

Parameters

-name <template name> - Name of the template

This parameter specifies the name of the template.

Examples

The following example deletes a template named template1 from the cluster:

```
cluster1::> template delete -name template1
```

template download

Download a template

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Use this command to download a template from an external server to the cluster.

Parameters

-uri *{(ftp|http)://(hostname|IPv4 Address|'IPv6 Address')}...* - **URI of the template**

This parameter specifies the URI from which the template will be downloaded.

[-name <template name>] - **Name of the template**

This parameter specifies the name that will be assigned to the template in the cluster.

Examples

The following example downloads the template specified in the -uri parameter value and names the template as template1:

```
cluster1::> template download -uri http://www.example.com/netapp-templates/mysample -name template1
```

The following example downloads the template specified in the -uri parameter value:

```
cluster1::> template download -uri http://www.example.com/netapp-templates/template1
```

template provision

Provision Data ONTAP resources using the template

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The command `template provision` provisions ONTAP system based on the template that is passed as an input to the template parameter. A wizard is presented which will accept the required inputs.

Parameters

-name <template name> - **Name of the template**

This parameter specifies the name of the template

[-simulate {true|false}] - **Simulate**

If this parameter is specified, the provisioning is just simulated and there will be no changes done to the system.

Examples

The following example provisions a vservers with required protocols using template.

```
cluster-1::> template provision -name VserverEnvironmentSetup
Press Ctrl+C to abort.

template rename

Rename a template

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Use this command to rename an existing template.

Parameters

-name <template name> - Name of the template

This parameter specifies the name of the template.

-new-name <template name> - New name of the template

This parameter specifies the template's new name.

Examples

The following example renames a template template1 as template2:

```
cluster1::> template rename -name template1 -new-name template2
```

template show

Display templates

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `template show` command displays information about templates. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, then the command displays the following information about all the templates:

- Template Name
- Permission (*readonly* or *readwrite*)

To display detailed information about a single template, run the command with the `-name` parameter. The detailed view provides all of the information in the previous list with the following additional information:

- Parent Template Name
- Description
- Version
- UUID of the Template

To display detailed information about all templates, run the command with the `-instance` parameter.

You can specify additional parameters to display information that matches only those parameters. For example, to display information only about templates with *readonly* permissions, run the command with the `-permission readonly` parameter.

Parameters

{ [-fields <fieldname>, ...]

This parameter specifies the fields that need to be displayed.

| [-instance]}

If this parameter is specified, the command displays information about all entries.

[-name <template name>] - Name of the template

If this parameter is specified, the command displays the detailed information about the template that matches the specified name.

[-permission <template_permission>] - Permission

If this parameter is specified, the command displays information about the template or templates that matches the specified permission.

[-parent-template <text>] - Parent template name

If this parameter is specified, the command displays information about the template or templates that matches the specified parent template name.

[-description <text>] - Description

If this parameter is specified, the command displays information about the template or templates that matches the specified description.

[-version <text>] - Version

If this parameter is specified, the command displays information about the template or templates that matches the specified version.

[-uuid <UUID>] - UUID of the template

If this parameter is specified, the command displays information about the template or templates that matches the specified uuid.

Examples

The following example displays information about all templates in the cluster:

```
cluster1::> template show
Template                                     Permission
-----
template1                                   readonly
template2                                   readwrite
```

The following example displays detailed information about a template named template1:

```
cluster1::> template show -name template1
Name of the Template: template1
Permission: readonly
Parent Template Name: -
Description: Template to configure Vserver Environment
Version: 1.0
UUID of the Template: c8dfef58-b5c5-5697-a829-18d4ee0ba202
```

template show-permissions

Display Template Allowed and Disallowed System Objects

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The template show-permission command shows all the system objects that are allowed and disallowed for the current user.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-name <text>] - Name

If you specify this parameter, only permissions that match the specified name are displayed.

[-object-name <text>] - Object Name

If you specify this parameter, only permissions that match the specified object-name are displayed.

[-permission <text>] - Permission

If you specify this parameter, only permissions that match the specified permission are displayed.

[-command-name <text>] - Command Name

If you specify this parameter, only permissions that match the specified command-name are displayed.

Examples

The following example shows all the the allowed and disallowed system objects

```
cluster1::> template show-permissions
Template: VserverEnvironmentSetup
Object Name      Command Name      Permission
-----
access.dns       vservice dns create allowed
network.interface network interface create allowed
network.routes   network route create allowed
protocols.CIFS    vservice cifs create allowed
```

template upload

Upload an existing template to an external server

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Use this command to upload an existing template on to an external server.

Parameters

-name <template name> - **Name of the template**

This parameter specifies the name of the template.

-uri {(ftp|http)://(hostname|IPv4 Address|['IPv6 Address'])*} - **URI to upload the template**

This parameter specifies the URI to which the template will be uploaded.

Examples

The following example uploads a template template1 on to an external server specified in the uri input parameter:

```
cluster1::*> template upload -name template1 -uri http://www.example.com/mytemplates/
```

Template Parameter Commands

The template parameter directory

The `template parameter` commands enable you to manage Parameters of Templates.

template parameter modify

Modify the template parameters

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `template parameter modify` command can be used to modify the following attributes of a template parameter:

- Default value of the parameter

Parameters

-template <template name> - **Name of the template**

Name of the template.

-name <text> - **Name of the parameter**

This parameter specifies the name of the parameter.

[-default-value <text>] - **Default value of the parameter**

This parameter specifies the default value of the parameter. This value is used by the [“template provision” on page 1302](#) command when it provisions the system using this template.

Examples

The following example modifies the default value of the parameter param1 in template template1 to value1:

```
cluster1::> template parameter modify -template template1 -parameter param1 -default-value value1
```

template parameter show

Display template parameters

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `template parameter show` command displays information about the parameters of a template. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all the parameters of all the templates in the system:

- Name of the template
- Name of the parameter
- Permission (*readonly* or *readwrite*)
- Default Value for the parameter
- Readonly
- Description

To display detailed information about a single parameter of the template run the command with the `-name` parameter. The detailed view provides all of the information in the previous list with the following additional information:

- Recommended Value for the parameter
- Maximum Length
- Range Maximum
- Range Minimum
- Allowed Values

To display detailed information about all the parameters of the template, run the command with the `-instance` parameter

You can specify additional parameters to display information that matches only those parameters. For example, to display information about all the parameters of the templates with *readonly* permissions, run the command with the `-permission readonly` parameter.

Parameters

{ [-fields <fieldname>, ...]

This parameter specifies the fields that need to be displayed.

| [-instance]}

If this parameter is specified, the command displays information about all entries.

[-template <template name>] - Name of the template

Name of the template.

[-name <text>] - Name of the parameter

If this parameter is specified, the command displays information about the parameter of all the templates that matches the specified parameter name.

[-permission <text>] - Template permission

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified permission.

[-type <text>] - Type of the parameter

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified type.

[-description <text>] - Parameter description

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified description.

[-recommended-value <text>] - Recommended value of the parameter

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified recommended value.

[-default-value <text>] - Default value of the parameter

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified default value.

[-readonly {yes|no}] - Read-only parameter

If this parameter is specified with a value of true, then all the parameters that cannot be modified of all templates are displayed. If the value specified is false, then all the parameters that can be modified of all templates are displayed.

[-max-length <integer>] - Maximum length

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified maximum length.

[-range-max <integer>] - Maximum range

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified maximum range.

[-range-min <integer>] - Minimum range

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified minimum range.

[-allowed-vals <text>] - Allowed values

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified allowed values.

Examples

The following example displays information about all the parameters of all the templates in the cluster:

```
cluster1::> template parameter show
Template: template1
Permission: readonly
```

Parameter	Type	Default Value	Read Only	Description
parameter1	string	-	No	Parameter1
parameter2	IPAddress	-	No	Parameter2

Chapter 28. Volume Commands

Manage virtual storage, including volumes, snapshots, and mirrors

The `volume` commands enable you to manage volumes, mirrors, and Snapshot(tm) copies.

volume autosize

Set/Display the autosize settings of the flexible volume.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume autosize` command allows the user to specify the maximum size that a volume will automatically grow to when it is out of space or the minimum size that it will shrink to when the amount of used space is below a certain threshold. If only the volume/Vserver name is specified then the current settings are displayed. This command is not supported on Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver Name

This parameter can be used to specify the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This parameter specifies the volume for which the user wants to set or display the autosize configuration.

{ [-maximum-size <integer>[KB|MB|GB|TB|PB]] - Maximum Autosize

This parameter allows the user to specify the maximum size to which a flexible volume can grow. The default for FlexVol volumes is 120% of the volume size. If the value of this parameter is invalidated by manually resizing the volume or is invalid when the autosize feature is enabled, the maximum size is reset to 120% of the volume size. The value for `-maximum-size` cannot be set larger than the platform-dependent maximum FlexVol volume size. If you specify a larger value, the value of `-maximum-size` is automatically reset to the supported maximum without returning an error. This parameter is not supported on Infinite Volumes.

[-minimum-size <integer>[KB|MB|GB|TB|PB]] - Minimum Autosize

This parameter specifies the minimum size to which the volume can automatically shrink. If the volume was created with the `grow_shrink` autosize mode enabled, then the default minimum size is equal to the initial volume size. If the value of the `-minimum-size` parameter is invalidated by a manual volume resize or is invalid when autosize is enabled, the minimum size is reset to the volume size. This parameter is not supported on Infinite Volumes.

[-grow-threshold-percent <percent>] - Grow Threshold Used Space Percentage

This parameter specifies the used space threshold for the automatic growth of the volume. When the volume's used space becomes greater than this threshold, the volume will automatically grow unless it has reached the maximum autosize. This parameter is not supported on Infinite Volumes.

[-shrink-threshold-percent <percent>] - Shrink Threshold Used Space Percentage

This parameter specifies the used space threshold for the automatic shrinking of the volume. When the amount of used space in the volume drops below this threshold, the volume will shrink unless it has reached the specified minimum size. This parameter is not supported on Infinite Volumes.

[-mode {off|grow|grow_shrink}] - Autosize Mode

This parameter specifies the autosize mode for the volume. The supported autosize modes are:

- *off* - The volume will not grow or shrink in size in response to the amount of used space.
- *grow* - The volume will automatically grow when used space in the volume is above the grow threshold.
- *grow_shrink* - The volume will grow or shrink in size in response to the amount of used space.

By default, *-mode* is *off* for new FlexVol volumes, except for DP mirrors, for which the default value is *grow_shrink*. The *grow* and *grow_shrink* modes work together with Snapshot autodelete to automatically reclaim space when a volume is about to become full. The volume parameter *-space-mgmt-try-first* controls the order in which these two space reclamation policies are attempted. This parameter is not supported on Infinite Volumes.

[*-reset [true]*] - Autosize Reset

This option allows the user to reset the values of autosize, max-autosize, min-autosize, autosize-grow-threshold-percent, autosize-shrink-threshold-percent and autosize-mode to their default values based on the current size of the volume. For example, the max-autosize value will be set to 120% of the current size of the volume.

Examples

The following example sets the autosize settings on a volume named vol1. The maximum size to grow is 1TB and autogrow is enabled.

```
cluster1::> vol autosize vol1 -maximum-size 1t -mode grow
(volume autosize)
vol autosize: Flexible volume 'vs1:vol1' autosize settings UPDATED.
```

The following example shows the autosize settings on a volume named vol1. The maximum size to grow is 1TB and autogrow is enabled.

```
cluster1::> vol autosize vol1
(volume autosize)
Volume autosize is currently ON for volume 'vs1:vol1'.
The volume is set to grow to a maximum of 1t.
```

volume create

Create a new volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume create` command creates a volume on a specified Vserver and storage aggregates. You can optionally specify the following attributes for the new volume:

- Size
- State (online, offline, or restricted)
- Type (read-write or data-protection)
- Export policy
- User ID
- Group ID
- Security style (All volume types: UNIX mode bits, CIFS ACLs, or mixed NFS and CIFS permissions.)
- Default UNIX permissions for files on the volume
- Language

- Junction path
- Whether the junction path is active (advanced privilege level or higher only)
- Whether the volume is the root volume for its Vserver (advanced privilege level or higher only)
- Comment
- Whether autosizing is enabled for FlexVols
- Maximum size for autosizing FlexVols
- Minimum size for autosize
- Grow used space threshold percentage for autosize
- Shrink used space threshold percentage for autosize
- Whether autosizing is enabled for FlexVols
- Current mode of operation of volume autosize
- Maximum directory size (advanced privilege level or higher only)
- Space guarantee style (none or volume)
- Space SLO type (none, thick or semi-thick)
- Snapshot policy
- Snapshot reserve percentage
- Whether the volume create operation runs as a foreground or background process
- Caching policy
- Encrypt
- Cache retention priority
- Efficiency policy
- Tiering minimum cooling days

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the volume is located. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name

This specifies the name of the volume that is to be created. A volume's name must start with an alphabetic character (a to z or A to Z) and be 197 or fewer characters in length for FlexGroups, and 203 or fewer characters in length for all other volume types. Volume names must be unique within a Vserver.

{ -aggregate <aggregate name> - Aggregate Name

This specifies the storage aggregate on which the volume is to be created. This parameter only applies to FlexVol volumes.

| -aggr-list <aggregate name>, ... - List of Aggregates for FlexGroup Constituents

Specifies an array of names of aggregates to be used for FlexGroup constituents. Each entry in the list will create a constituent on the specified aggregate. An aggregate may be specified multiple times to have multiple constituents created on it. This parameter only applies to FlexGroups.

[-aggr-list-multiplier <integer>] - Aggregate List Repeat Count

Specifies the number of times to iterate over the aggregates listed with the -aggr-list parameter when creating a FlexGroup. The aggregate list will be repeated the specified number of times. Example:

```
-aggr-list aggr1,aggr2 -aggr-list-multiplier 2
```

will cause four constituents to be created in the order *aggr1*, *aggr2*, *aggr1*, *aggr2*.

The default value is 4.

This parameter only applies to FlexGroups

| -auto-provision-as <FlexGroup>] - Automatically Provision as Volume of Type

Use this parameter to automatically select existing aggregates for provisioning FlexGroup volumes. Note that the fastest aggregate type with at least one aggregate on each node of the cluster will be selected. When auto provisioning a FlexGroup volume, the size of the FlexGroup volume should be a minimum of 800 GB per node.

This parameter only applies to FlexGroups.

[-size {<integer>[KB|MB|GB|TB|PB]]] - Volume Size

This optionally specifies the size of the volume. The size is specified as a number followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit designation is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. The minimum size for a FlexVol volume is 20 MB. The minimum size for a FlexGroup volume is 200 MB per constituent. However, the recommended size for a FlexGroup volume is a minimum of 100 GB per constituent. For all volumes, the default size is set to the minimum size. The volume's maximum size is limited by the platform maximum. If the volume's guarantee is set to `volume`, the volume's maximum size can also be limited by the available space in the hosting aggregates. Volumes can be increased and decreased in size with the [“volume modify” on page 1321](#) command. The maximum number of files a volume is configured for is listed under "Total Files" when running the command [“volume show” on page 1334](#) - instance.

[-state {online|restricted|offline|force-online|force-offline|mixed}] - Volume State

This optionally specifies the volume's state. A restricted volume does not provide client access to data but is available for administrative operations.

Note: The *mixed* state applies to FlexGroups only and cannot be specified as a target state.

[-policy <text>] - Export Policy

This optionally specifies the ID number of the export policy associated with the volume. For information on export policies, see the documentation for the [“vserver export-policy create” on page 1665](#) command. FlexGroups do not support policies that allow NFSv4 protocol access.

[-user <user name>] - User ID

This optionally specifies the name or ID of the user that is set as the owner of the volume's root.

[-group <group name>] - Group ID

This optionally specifies the name or ID of the group that is set as the owner of the volume's root.

[-security-style <security style>] - Security Style

This optionally specifies the security style for the volume. Possible values include *unix* (for UNIX mode bits), *ntfs* (for CIFS ACLs), *mixed* (for mixed NFS and CIFS permissions) and *unified* (for mixed NFS and CIFS permissions with unified ACLs). Regardless of the security style, both NFS and CIFS clients can read from and write to the volume.

[-unix-permissions <unix perm>] - UNIX Permissions

This optionally specifies the default UNIX permissions for files on the volume. Specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX `ls` command (for example, `-rwxr-x---`). For information on UNIX permissions, see the UNIX or Linux documentation. The default setting is 0755 or `---rwxr-xr-x`.

[-junction-path <junction path>] - Junction Path

This optionally specifies the volume's junction path. The junction path name is case insensitive and must be unique within a Vserver's namespace.

[-junction-active {true|false}] - Junction Active (privilege: advanced)

This optionally specifies whether the volume's junction path is active. The default setting is `true`. If the junction path is inactive, the volume does not appear in the Vserver's namespace. This parameter is available only at the advanced privilege level and higher.

`[-vsroot {true|false}] - Vserver Root Volume (privilege: advanced)`

This optionally specifies whether the volume is the root volume of its Vserver. The default setting is `false`. If this parameter is set to `true`, the default size of the newly created volume is 1GB. This parameter is not supported on FlexGroups.

`[-comment <text>] - Comment`

This optionally specifies a comment for the volume.

`[-max-autosize {<integer>[KB|MB|GB|TB|PB]] - Maximum Autosize`

This parameter allows the user to specify the maximum size to which a volume can grow. The default for volumes is 120% of the volume size. If the value of this parameter is invalidated by manually resizing the volume, the maximum size is reset to 120% of the volume size. The value for `-max-autosize` cannot be set larger than the platform-dependent maximum volume size. If you specify a larger value, the value of `-max-autosize` is automatically reset to the supported maximum without returning an error.

`[-min-autosize {<integer>[KB|MB|GB|TB|PB]] - Minimum Autosize`

This parameter specifies the minimum size to which the volume can automatically shrink. If the volume was created with the `grow_shrink` autosize mode enabled, then the default minimum size is equal to the initial volume size. If the value of the `-min-autosize` parameter is invalidated by a manual volume resize, the minimum size is reset to the volume size.

`[-autosize-grow-threshold-percent <percent>] - Autosize Grow Threshold Percentage`

This parameter specifies the used space threshold for the automatic growth of the volume. When the volume's used space becomes greater than this threshold, the volume will automatically grow unless it has reached the maximum autosize.

`[-autosize-shrink-threshold-percent <percent>] - Autosize Shrink Threshold Percentage`

This parameter specifies the used space threshold for the automatic shrinking of the volume. When the amount of used space in the volume drops below this threshold, the volume will shrink unless it has reached the specified minimum size.

`[-autosize-mode {off|grow|grow_shrink}] - Autosize Mode`

This parameter specifies the autosize mode for the volume. The supported autosize modes are:

- `off` - The volume will not grow or shrink in size in response to the amount of used space.
- `grow` - The volume will automatically grow when used space in the volume is above the grow threshold.
- `grow_shrink` - The volume will grow or shrink in size in response to the amount of used space.

By default, `-autosize-mode` is `off` for new volumes, except for data protection mirrors, for which the default value is `grow_shrink`. The `grow` and `grow_shrink` modes work together with Snapshot autodelete to automatically reclaim space when a volume is about to become full. The volume parameter `-space-mgmt - try - first` controls the order in which these two space reclamation policies are attempted.

`[-maxdir-size {<integer>[KB|MB|GB|TB|PB]] - Maximum Directory Size (privilege: advanced)`

This optionally specifies the maximum directory size. The default maximum directory size is model-dependent and optimized for the size of system memory.

`{ [-space-slo {none|thick|semi-thick}] - Space SLO`

This optionally specifies the Service Level Objective for space management (the space SLO setting) for the volume. The space SLO value is used to enforce volume settings so that sufficient space is set aside to meet the space SLO. The default setting is `none`. There are three supported values: `none`, `thick` and `semi-thick`.

- *none*: The value of *none* does not provide any guarantee for overwrites or enforce any restrictions. It should be used if the admin plans to manually manage space consumption in the volume and aggregate, and out of space errors.
- *thick*: The value of *thick* guarantees that the hole fills and overwrites to space-reserved files in this volume will always succeed by reserving space. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:
 - Space Guarantee: *volume* - The entire size of the volume is preallocated in the aggregate. Changing the volume's *space-guarantee* type is not supported.
 - Fractional Reserve: *100* - 100% of the space required for overwrites is reserved. Changing the volume's *fractional-reserve* setting is not supported.
- *semi-thick*: The value of *semi-thick* is a best-effort attempt to ensure that overwrites succeed by restricting the use of features that share blocks and auto-deleting backups and Snapshot copies in the volume. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:
 - Space Guarantee: *volume* - The entire size of the volume is preallocated in the aggregate. Changing the volume's *space-guarantee* type is not supported.
 - Fractional Reserve: *0* - No space will be reserved for overwrites by default. However, changing the volume's *fractional-reserve* setting is supported. Changing the setting to 100 means that 100% of the space required for overwrites is reserved.
 - Snapshot Autodelete: *enabled* - Automatic deletion of Snapshot copies is enabled to reclaim space. To ensure that the overwrites can be accommodated when the volume reaches threshold capacity, the following volume snapshot autodelete parameters are set automatically to the specified values and cannot be modified:
 - *enabled*: *true*
 - *commitment*: *destroy*
 - *trigger*: *volume*
 - *defer-delete*: *none*
 - *destroy-list*: *vol_clone, lun_clone, file_clone, cifs_share*

In addition, with a value of *semi-thick*, the following technologies are not supported for the volume:

- File Clones with autodelete disabled: Only full file clones of files, LUNs or NVMe namespaces that can be autodeleted can be created in the volume. The use of *autodelete* for file clone create is required.
- Partial File Clones: Only full file clones of files or LUNs that can be autodeleted can be created in the volume. The use of *range* for file clone create is not supported.
- Volume Efficiency: Enabling volume efficiency is not supported to allow autodeletion of Snapshot copies.

[*-space-guarantee* | *-s* {*none*|*volume*}] - Space Guarantee Style

This optionally specifies the space guarantee style for the volume. A value of *volume* reserves space on the aggregates for the entire volume. A value of *none* reserves no space on the aggregates, meaning that writes can fail if an aggregate runs out of space. Because CIFS does not handle out-of-space conditions, do not use the value *none* if the volume is accessible to CIFS clients. The default setting for the volumes on All Flash FAS systems is *none*, otherwise the default setting is *volume*. The *file* setting is no longer supported.

[*-type* {*RW*|*DP*}] - Volume Type

This optionally specifies the volume's type, either read-write (RW) or data-protection (DP). If you do not specify a value for this parameter, a RW volume is created by default.

[*-percent-snapshot-space* <*percent*>] - Space Reserved for Snapshot Copies

This optionally specifies the amount of space that is reserved in the volume for Snapshot copies. The default setting is 5 percent, except for data protection mirrors for which the default is 0 percent.

[-snapshot-policy <snapshot policy>] - Snapshot Policy

This optionally specifies the Snapshot policy for the volume. The default is the Snapshot policy for all volumes on the Vserver, as specified by the `-snapshot-policy` parameter of the [“vserver create” on page 1514](#) and [“vserver modify” on page 1516](#) commands. The schedules associated with the `snapshot-policy` for a FlexGroup cannot have an interval shorter than 30 minutes.

[-language <Language code>] - Language

This optionally specifies the language encoding setting for the volume. By default, the volume inherits the Vserver language encoding setting.

Note: You cannot modify the language encoding setting of a volume.

[-foreground {true|false}] - Foreground Process

This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the operation completes. This parameter applies only to FlexGroups. For FlexVol volumes, the command always runs in the foreground.

[-nvfail {on|off}] - NVFAIL Option

Setting this optional parameter to `true` causes the volume to set the `in-nvfailed-state` flag to `true`, if committed writes to the volume are lost due to a failure. The `in-nvfailed-state` flag fences the volume from further data access and prevents possible corruption of the application data. Without specifying a value, this parameter is automatically set to `false`.

[-storage-service <storage service name>] - Storage Service Name (privilege: advanced)

This parameter is no longer supported.

[-unreachable-attr-action {return-generated|wait}] - Action When Attributes Are Not Reachable (privilege: advanced)

This parameter is no longer supported.

[-namespace-aggregate <aggregate name>] - Namespace Aggregate (privilege: advanced)

This parameter is no longer supported.

[-max-namespace-constituent-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of Namespace Constituent (privilege: advanced)

This parameter is no longer supported.

[-ns-mirror-aggr-list <aggregate name>, ...] - List of Aggregates for Namespace Mirrors (privilege: advanced)

This parameter is no longer supported.

[-data-aggr-list <aggregate name>, ...] - List of Aggregates for Data Constituents (privilege: advanced)

This parameter is no longer supported.

[-max-data-constituent-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of Each Data Constituent (privilege: advanced)

This parameter is no longer supported.

{ [-qos-policy-group <text>] - QoS Policy Group Name

This optional parameter specifies which QoS policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) that do not adjust based on the volume allocated space or used space. If you do not assign a policy group to a volume, the system will not monitor and control the traffic to it.

| [-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name

This optional parameter specifies which QoS adaptive policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that

adjust based on the volume allocated space or used space. This parameter is not supported on FlexGroups.

[-caching-policy <text>] - Caching Policy Name

This optionally specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in a Flash Pool aggregate or Flash Cache modules. If a caching policy is not assigned to this volume, the system uses *auto* as the default caching policy.

Both metadata and user data are eligible for caching. Metadata consists of directories, indirect blocks and system metafiles. They are eligible for read caching only. When a random write pattern is detected on user data, the first such write is eligible for read caching while all subsequent overwrites are eligible for write caching. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread-random_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta-random_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random_read_write-random_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all_read-random_write - Read caches all metadata, randomly read and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all_read_random_write-random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.
- all-random_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is *auto*.

[-cache-retention-priority {normal|low|high}] - Cache Retention Priority (privilege: advanced)

This optionally specifies the cache retention priority to apply to the volume. A cache retention priority defines how long the blocks of a volume will be cached in flash pool once they become cold. If a cache retention priority is not assigned to this volume, the system uses the default policy. This parameter is available only at the advanced privilege level and higher.

The available cache retention priority are:

- low - Cache the cold blocks for the lowest time.
- normal - Cache the cold blocks for the default time.
- high - Cache the cold blocks for the highest time.

`[-is-autobalance-eligible {true|false}]` - Is Eligible for Auto Balance Aggregate (privilege: advanced)

If the Auto Balance feature is enabled, this parameter specifies whether the volume might be considered for system workload balancing. When set to *true*, the Auto Balance Aggregate feature might recommend moving this volume to another aggregate. The default value is *true*.

`[-max-constituent-size {<integer>[KB|MB|GB|TB|PB]]` - Maximum size of a FlexGroup Constituent (privilege: advanced)

This optionally specifies the maximum size of a FlexGroup constituent. The default value is determined by checking the maximum FlexVol size setting on all nodes used by the FlexGroup. The smallest value found is selected as the default for the `-max-constituent-size` for the FlexGroup. This parameter applies to FlexGroups only.

`[-efficiency-policy <efficiency policy>]` - Storage Efficiency Policy (privilege: advanced)

This optionally specifies which storage efficiency policy to apply to the volume. This parameter is applicable only for All-Flash FAS. This parameter is not supported on data protection volumes on any platform. To disable compression on the volume in All-Flash FAS, use the value *none*. The default value is *inline-only*.

`[-vserver-dr-protection {protected|unprotected}]` - Vserver DR Protection

This optionally specifies whether the volume should be protected by Vserver level SnapMirror. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship. The default value for a volume of type "RW" is *protected*.

`[-encrypt [true]]` - Enable Encryption

This parameter allows the user to create an encrypted volume. When it is set to *true*, a new key is generated, and the volume will be encrypted using the generated key. By default, volume created is not encrypted.

`[-tiering-policy {snapshot-only|auto|none|backup}]` - Volume Tiering Policy

This optional parameter specifies the tiering policy to apply to the volume. This policy determines whether the user data blocks of a volume in a FabricPool will be tiered to the capacity tier when they become cold. FabricPool combines flash (performance tier) with an object store (external capacity tier) into a single aggregate. If a tiering policy is not assigned to this volume, then 'snapshot-only' is assigned as the default policy. Temperature of a volume block increases if it is accessed frequently and decreases when it is not.

The available tiering policies are:

- *snapshot-only* - This policy allows tiering of only the volume Snapshot copies not associated with the active file system. The default minimum cooling period is 2 days. The `-tiering-minimum-cooling-days` parameter can be used to override the default.
- *auto* - This policy allows tiering of both snapshot and active file system user data to the capacity tier. The default cooling period is 31 days. The `-tiering-minimum-cooling-days` parameter can be used to override the default.
- *none* - Volume blocks will not be tiered to the capacity tier.
- *backup* - On DP volumes this policy allows all transferred user data blocks to start in the capacity tier.

`[-tiering-minimum-cooling-days <integer>]` - Volume Tiering Minimum Cooling Days (privilege: advanced)

This optional parameter specifies the minimum number of days that user data blocks of the volume must be cooled before they can be considered cold and tiered out to the capacity tier. This parameter is only used for tiering purpose and does not affect the reporting of inactive data. The value specified should be greater than the frequency that applications in the volume shift between different sets of data. Valid values are between 2 and 63. You cannot set this parameter on 'none' or 'backup' volume tiering policy. The default value for this option is tied to the volume's tiering-policy. See the tiering-policy section of this man page for corresponding default values. If the tiering policy on the volume gets changed, then this option will be reset to the default value corresponding to the new tiering policy.

Examples

Specifies the number of times to iterate over the aggregates listed with the `-aggr-list` parameter when creating a FlexGroup. The aggregate list will be repeated the specified number of times. Example:

```
-aggr-list aggr1,aggr2 -aggr-list-multiplier 2
```

The following example creates a new volume named `user_jdoe` on a Vserver named `vs0` and a storage aggregate named `aggr1`. Upon its creation, the volume is placed in the online state. It uses the export policy named `default_expolicy`. The owner of the volume's root is a user named `jdoe` whose primary group is named `dev`. The volume's junction path is `/user/jdoe`. The volume is 250 GB in size, space for the entire volume is reserved on the aggregate, and the create operation runs in the background.

```
cluster1::> volume create -vserver vs0 -volume user_jdoe -aggregate aggr1
               -state online -policy default_expolicy -user jdoe -group dev
               -junction-path /user/jdoe -size 250g -space-guarantee volume
               -percent-snapshot-space 20 -foreground false
```

The following example creates a new volume named `vol_cached` on a Vserver named `vs0` and a Flash Pool storage aggregate named `aggr1`. The newly created volume is placed online and uses `auto` as the caching policy.

```
cluster1::> volume create -vserver vs0 -volume vol_cached -aggregate aggr1
               -state online -caching-policy auto
```

The following example creates a new FlexGroup named `media_vol` on a Vserver named `vs0` with four constituents on aggregates `aggr1` and `aggr2`. Upon its creation, the volume is placed in the online state. The volume's junction path is `/media`. The volume is 200 TB in size, no space for the volume is reserved on the aggregates, and the create operation runs in the background.

```
cluster1::> volume create -vserver vs0 -volume media_vol
               -aggr-list aggr1,aggr1,aggr2,aggr2 -junction-path /media -size 200TB
               -space-guarantee none -foreground false
```

The following example creates a new FlexGroup volume named `fg` on a Vserver named `vs0` on aggregates selected by Data ONTAP.

```
cluster1::> volume create -vserver vs0 -volume fg -auto-provision-as flexgroup
```

volume delete

Delete an existing volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume delete` command deletes the specified volumes. Before deleting a volume, the user is prompted to confirm the operation unless the `-force` flag is specified. If this volume was associated with a policy group the underlying qos workload is deleted.

Notes:

- If there is a qtree or quota policy associated with a volume, it is deleted when you delete the volume.
- A volume must be offline (see [“volume offline” on page 1331](#)) to be deleted.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the name of the Vserver from which the volume is to be deleted. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name

This specifies the name of the volume that is to be deleted.

[-force [true]] - Force Delete (privilege: advanced)

If this parameter is specified, the user is not prompted to confirm each deletion operation. In addition, the operation is run only on the local node, and several potential errors are ignored. By default, this setting is false. This parameter is available only at the advanced privilege level and higher.

`[-foreground {true|false}] - Foreground Process`

This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the operation completes.

Examples

The following example deletes a volume named `vol1_old` from a Vserver named `vs0`:

```
cluster1::> volume delete -vserver vs0 -volume vol1_old
```

volume expand

Expand the size of a volume by adding constituents

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume expand` command allows the user to increase the size of a FlexGroup by adding constituents. The size of the new constituents is determined by the size of the smallest existing constituent. This command only applies to FlexGroups.

Parameters

`-vserver <vserver name> - Vserver Name`

This parameter can be used to specify the Vserver on which the volume is located.

`-volume <volume name> - Volume Name`

This parameter specifies the volume for which the user wants to expand.

`-aggr-list <aggregate name>, ... - List of Aggregates for FlexGroup Constituents`

Specifies an array of names of aggregates to be used for new FlexGroup constituents. Each entry in the list will create a constituent on the specified aggregate. An aggregate may be specified multiple times to have multiple constituents created on it.

`[-aggr-list-multiplier <integer>] - Aggregate List Repeat Count`

Specifies the number of times to iterate over the aggregates listed with the `-aggr-list` parameter when expanding a FlexGroup. The aggregate list will be repeated the specified number of times. Example:

```
-aggr-list aggr1,aggr2 -aggr-list-multiplier 2
```

will cause four constituents to be created in the order *aggr1*, *aggr2*, *aggr1*, *aggr2*. The default value is 1.

`[-foreground {true|false}] - Foreground Process`

If `false` is specified for this parameter, the command runs as a job in the background. If `true` is specified, the command will not return until the operation is complete. The default value is `true`.

Examples

Specifies the number of times to iterate over the aggregates listed with the `-aggr-list` parameter when expanding a FlexGroup. The aggregate list will be repeated the specified number of times. Example:

```
-aggr-list aggr1,aggr2 -aggr-list-multiplier 2
```

The following example increases the size of a FlexGroup by adding 3 constituents:

```
cluster1:: volume show -vserver vs1 -volume flexgroup -fields size
vserver volume      size
-----
vs1      flexgroup 180TB
```

```
cluster1:: volume expand -vserver vs1 -volume flexgroup -aggr-list aggr1,aggr2,aggr3
```

Warning: The following number of constituents of size 20TB will be added to FlexGroup "flexgroup": 3. Expanding the FlexGroup will cause the state of

```
all Snapshot copies to be set to "partial". Partial Snapshot copies
cannot be restored.
Do you want to continue? [y|n]: y
[Job 52] Job succeeded: Successful
```

```
cluster1:: volume show -vserver vs1 -volume flexgroup -fields size
vserver volume      size
-----
vs1      flexgroup 240TB
```

The following example increase the size of a FlexGroup by adding 6 constituents using the `-aggr-list-multiplier`:

```
cluster1:: volume show -vserver vs1 -volume flexgroup -fields size
vserver volume      size
-----
vs1      flexgroup 240TB

cluster1:: volume expand -vserver vs1 -volume flexgroup -aggr-list aggr1,aggr2 -aggr-list-multiplier 3

Warning: The following number of constituents of size 20TB will be added to
FlexGroup "flexgroup": 6. Expanding the FlexGroup will cause the state of
all Snapshot copies to be set to "partial". Partial Snapshot copies
cannot be restored.
Do you want to continue? [y|n]: y
[Job 53] Job succeeded: Successful

cluster1:: volume show -vserver vs1 -volume flexgroup -fields size
vserver volume      size
-----
vs1      flexgroup 360TB
```

volume make-vsroot

Designate a non-root volume as a root volume of the Vserver

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `volume make-vsroot` command promotes a non-root volume of the Vserver to be the Vserver's root volume. The Vserver's root volume must be a FlexVol volume with a size of atleast 1 GB.

For instance, if you run this command on a volume named *user* that is located on a Vserver named *vs0*, the volume *user* is made the root volume of the Vserver *vs0*.

If you run this command on a Vserver with Infinite Volume, you must create a new root volume. You cannot promote an existing non-root volume to be the root volume of the Vserver with Infinite Volume. When the command executes, the new root volume is created on the aggregate specified by the *aggregate* parameter, and the old root volume is deleted.

This command is available only at the advanced privilege level and higher.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which a non-root volume is to be made the root volume.

-volume <volume name> - Volume Name

This specifies the non-root volume that is to be made the root volume of its Vserver. For Vservers with FlexVol volume this must be an existing FlexVol volume. For Vservers with Infinite Volume this must be a non-existent volume that will be created during the execution of the command. Using a SnapLock volume as the root volume for a Vserver is not supported.

[*-aggregate <aggregate name>*] - Aggregate Name

This specifies the aggregate that the new root volume will be created on for Vservers with Infinite Volume. This parameter is not supported for Vservers with FlexVol volumes.

Examples

The following example makes a volume named *root_vs0_backup* the root volume of its Vserver with FlexVol volumes, which is named *vs0*.

```
node::> volume make-vsroot -vserver vs0 -volume root_vs0_backup
```

The following example makes a volume named *root_vs1* the root volume of the Vserver with Infinite Volume *vs1*.

```
node::> volume make-vsroot -vserver vs1 -volume root_vs1 -aggregate aggr1
```

volume modify

Modify volume attributes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume modify` command can be used to modify the following attributes of a volume:

- Size
- State (online, offline, restricted, force-online or force-offline)
- Export policy
- User ID
- Group ID
- Security style (All volume types: UNIX mode bits, CIFS ACLs, or mixed NFS and CIFS permissions. Only Infinite Volumes can use unified.)
- Default UNIX permissions for files on the volume
- Whether the junction path is active
- Comment
- Volume nearly full threshold percent
- Volume full threshold percent
- Maximum size for autosizing
- Minimum size for autosize
- Grow used space threshold percentage for autosize
- Shrink used space threshold percentage for autosize
- Whether autosizing is enabled
- Current mode of operation of volume autosize
- Reset the autosize values to their defaults
- Total number of files for user-visible data permitted on the volume
- Space guarantee style (none or volume)
- Space SLO type (none, thick or semi-thick)
- Snapshot policy
- Use logical space reporting
- Use logical space enforcement
- Convert ucode

- Caching policy
- Cache retention priority
- Tiering minimum cooling days

You can use the [“volume move” on page 1428](#) command to change a volume's aggregate or node. You can use the [“volume rename” on page 1333](#) command to change a volume's name. You can use the [“volume make-vsroot” on page 1320](#) command to make a volume the root volume of its Vserver.

You can change additional volume attributes by using this command at the advanced privilege level and higher.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the volume is located. If only one data Vserver exists, you do not need to specify this parameter. Although node Vservers are not displayed when using <Tab> completion, this parameter supports node Vservers for modifying the root volume of the specified node Vserver.

-volume <volume name> - Volume Name

This specifies the volume that is to be modified.

[-size {<integer>[KB|MB|GB|TB|PB]] - Volume Size

This optionally specifies the new size of the volume. The size is specified as a number followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit designation is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. A relative rather than absolute size change can be specified by adding + or - before the given size: for example, specifying +30m adds 30 megabytes to the volume's current size. The minimum size for a volume is 20 MB (the default setting). The volume's maximum size is limited by the platform maximum. If the volume's guarantee is set to *volume*, the volume's maximum size can also be limited by the available space in the hosting aggregate. If the volume's guarantee is currently disabled, its size cannot be increased. This parameter is not supported on Infinite Volumes that are managed by storage services.

[-state {online|restricted|offline|force-online|force-offline|mixed}] - Volume State

This optionally specifies the volume's state. A restricted volume does not provide client access to data but is available for administrative operations.

Note: The *mixed* state applies to Infinite Volumes only and cannot be specified as a target state.

[-policy <text>] - Export Policy

This optionally specifies the ID number of the export policy associated with the volume. For information on export policy, see the documentation for the [“vserver export-policy create” on page 1665](#) command. FlexGroups do not support export policies that allow NFSv4 protocol access.

[-user <user name>] - User ID

This optionally specifies the name or ID of the user that is set as the owner of the volume's root.

[-group <group name>] - Group ID

This optionally specifies the name or ID of the group that is set as the owner of the volume's root.

[-security-style <security style>] - Security Style

This optionally specifies the security style for the volume. Possible values include *unix* (for UNIX mode bits), *ntfs* (for CIFS ACLs), *mixed* (for mixed NFS and CIFS permissions) and *unified* (for mixed NFS and CIFS permissions with unified ACLs). Regardless of the security style, both NFS and CIFS clients can read from and write to the volume. The *unified* security style can only be used on Infinite Volumes.

[-unix-permissions <unix perm>] - UNIX Permissions

This optionally specifies the default UNIX permissions for files on the volume. Specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX *ls* command (for example,

-rwxr-x---). For information on UNIX permissions, see the UNIX or Linux documentation. The default setting is 0755 or -rwxr-xr-x.

[-junction-active {true|false}] - Junction Active (privilege: advanced)

This optionally specifies whether the volume's junction path is active. The default setting is `true`. If the junction is inactive, the volume does not appear in the Vserver's namespace.

[-comment <text>] - Comment

This optionally specifies a comment for the volume.

[-space-nearly-full-threshold-percent <percent>] - Volume Nearly Full Threshold Percent

This optionally specifies the percentage at which the volume is considered nearly full, and above which an EMS warning will be generated. This parameter is not supported on Infinite Volumes. The default value is 95%. The maximum value for this option is 99%. Setting this threshold to 0 disables the volume nearly full space alerts.

[-space-full-threshold-percent <percent>] - Volume Full Threshold Percent

This optionally specifies the percentage at which the volume is considered full, and above which a critical EMS error will be generated. This parameter is not supported on Infinite Volumes. The default value is 98%. The maximum value for this option is 100%. Setting this threshold to 0 disables the volume full space alerts.

{ [-max-autosize <integer>[KB|MB|GB|TB|PB]] - Maximum Autosize

This parameter allows the user to specify the maximum size to which a volume can grow. The default for volumes is 120% of the volume size. If the value of this parameter is invalidated by manually resizing the volume, the maximum size is reset to 120% of the volume size. The value for `-max-autosize` cannot be set larger than the platform-dependent maximum volume size. If you specify a larger value, the value of `-max-autosize` is automatically reset to the supported maximum without returning an error. This parameter is not supported on Infinite Volumes.

[-min-autosize <integer>[KB|MB|GB|TB|PB]] - Minimum Autosize

This parameter specifies the minimum size to which the volume can automatically shrink. If the volume was created with the `grow_shrink` autosize mode enabled, then the default minimum size is equal to the initial volume size. If the value of the `-min-autosize` parameter is invalidated by a manual volume resize, the minimum size is reset to the volume size. This parameter is not supported on Infinite Volumes.

[-autosize-grow-threshold-percent <percent>] - Autosize Grow Threshold Percentage

This parameter specifies the used space threshold for the automatic growth of the volume. When the volume's used space becomes greater than this threshold, the volume will automatically grow unless it has reached the maximum autosize. This parameter is not supported on Infinite Volumes.

[-autosize-shrink-threshold-percent <percent>] - Autosize Shrink Threshold Percentage

This parameter specifies the used space threshold for the automatic shrinking of the volume. When the amount of used space in the volume drops below this threshold, the volume will shrink unless it has reached the specified minimum size. This parameter is not supported on Infinite Volumes.

[-autosize-mode {off|grow|grow_shrink}] - Autosize Mode

This parameter specifies the autosize mode for the volume. The supported autosize modes are:

- `off` - The volume will not grow or shrink in size in response to the amount of used space.
- `grow` - The volume will automatically grow when used space in the volume is above the grow threshold.
- `grow_shrink` - The volume will grow or shrink in size in response to the amount of used space.

By default, `-autosize-mode` is `off` for new volumes, except for DP mirrors, for which the default value is `grow_shrink`. The `grow` and `grow_shrink` modes work together with Snapshot autodelete to automatically reclaim space when a volume is about to become full. The volume parameter `-space-mgmt-try-first` controls the order in which these two space reclamation policies are attempted. This parameter is not supported on Infinite Volumes.

[`-autosize-reset` [*true*]] - Autosize Reset

This allows the user to reset the values of `autosize`, `max-autosize`, `min-autosize`, `autosize-grow-threshold-percent`, `autosize-shrink-threshold-percent` and `autosize-mode` to their default values. For example, the `max-autosize` value will be set to 120% of the current size of the volume. This parameter is not supported on Infinite Volumes.

[`-files` <*integer*>] - Total Files (for user-visible data)

This optionally specifies the total number of files for user-visible data permitted on the volume. This value can be raised or lowered. Raising the total number of files does not immediately cause additional disk space to be used to track files. Instead, as more files are created on the volume, the system dynamically increases the number of disk blocks that are used to track files. The space assigned to track files is never freed, and the `files` value cannot be decreased below the current number of files that can be tracked within the assigned space for the volume.

[`-maxdir-size` {<*integer*>[*KB*|*MB*|*GB*|*TB*|*PB*]}] - Maximum Directory Size (privilege: advanced)

This optionally specifies the maximum directory size. The default maximum directory size is model-dependent, and optimized for the size of system memory. You can increase it for a specific volume by using this option, but doing so could impact system performance. If you need to increase the maximum directory size, work with customer support. This parameter is not supported on Infinite Volumes.

{ [`-space-slo` {*none*|*thick*|*semi-thick*}] - Space SLO

This optionally specifies the Service Level Objective for space management (the space SLO setting) for the volume. The space SLO value is used to enforce volume settings so that sufficient space is set aside to meet the space SLO. This parameter is not supported on Infinite Volumes. The default setting is *none*. There are three supported values: *none*, *thick* and *semi-thick*.

- *none*: The value of *none* does not provide any guarantee for overwrites or enforce any restrictions. It should be used if the admin plans to manually manage space consumption in the volume and aggregate, and out of space errors.
- *thick*: The value of *thick* guarantees that the hole fills and overwrites to space-reserved files in this volume will always succeed by reserving space. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:
 - Space Guarantee: *volume* - The entire size of the volume is preallocated in the aggregate. Changing the volume's `space-guarantee` type is not supported.
 - Fractional Reserve: *100* - 100% of the space required for overwrites is reserved. Changing the volume's `fractional-reserve` setting is not supported.
- *semi-thick*: The value of *semi-thick* is a best-effort attempt to ensure that overwrites succeed by restricting the use of features that share blocks and auto-deleting backups and Snapshot copies in the volume. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:
 - Space Guarantee: *volume* - The entire size of the volume is preallocated in the aggregate. Changing the volume's `space-guarantee` type is not supported.
 - Fractional Reserve: *0* - No space will be reserved for overwrites by default. However, changing the volume's `fractional-reserve` setting is supported. Changing the setting to 100 means that 100% of the space required for overwrites is reserved.
 - Snapshot Autodelete: *enabled* - Automatic deletion of Snapshot copies is enabled to reclaim space. To ensure that the overwrites can be accommodated when the volume reaches threshold capacity, the following volume snapshot autodelete parameters are set automatically to the specified values and cannot be modified:
 - `enabled`: *true*
 - `commitment`: *destroy*
 - `trigger`: *volume*
 - `defer-delete`: *none*

- `destroy-list: vol_clone, lun_clone, file_clone, cifs_share`

In addition, with a value of *semi-thick*, the following technologies are not supported for the volume:

- File Clones with autodelete disabled: Only full file clones of files, LUNs or NVMe namespaces that can be autodeleted can be created in the volume. The use of `autodelete` for file clone create is required.
- Partial File Clones: Only full file clones of files or LUNs that can be autodeleted can be created in the volume. The use of `range` for file clone create is not supported.
- Volume Efficiency: Enabling volume efficiency is not supported to allow autodeletion of Snapshot copies.

[`-space-guarantee` | `-s {none|volume}`] - Space Guarantee Style

This option controls whether the volume is guaranteed some amount of space in the aggregate. The default setting for the volumes on All Flash FAS systems is *none*, otherwise the default setting is *volume*. The file setting is no longer supported. Volume guaranteed means that the entire size of the volume is preallocated. The *none* value means that no space is preallocated, even if the volume contains space-reserved files or LUNs; if the aggregate is full, space is not available even for space-reserved files and LUNs within the volume. Setting this parameter to *none* enables you to provision more storage than is physically present in the aggregate (thin provisioning). When you use thin provisioning for a volume, it can run out of space even if it has not yet consumed its nominal size and you should carefully monitor space utilization to avoid unexpected errors due to the volume running out of space. For flexible root volumes, to ensure that system files, log files, and cores can be saved, the space-guarantee must be *volume*. This is to ensure support of the appliance by customer support, if a problem occurs. Disk space is preallocated when the volume is brought online and, if not used, returned to the aggregate when the volume is brought offline. It is possible to bring a volume online even when the aggregate has insufficient free space to preallocate to the volume. In this case, no space is preallocated, just as if the *none* option had been selected. In this situation, the `vol` options and `vol status` command display the actual value of the space-guarantee option, but indicate that it is disabled. This parameter is not supported on FlexGroups or Infinite Volumes that are managed by storage services.

[`-fractional-reserve <percent>`] - Fractional Reserve

This option changes the amount of space reserved for overwrites of reserved objects (LUNs, files) in a volume. This parameter is not supported on Infinite Volumes. The option is set to 100 by default with `guarantee` set to *volume*. A setting of 100 means that 100% of the required reserved space is actually reserved so the objects are fully protected for overwrites. The value is set to 0 by default with `guarantee` set to *none*. The value can be either 0 or 100 when `guarantee` is set to *volume* or *none*. Using a value of 0 indicates that no space will be reserved for overwrites. This returns the extra space to the available space for the volume, decreasing the total amount of space used. However, this does leave the protected objects in the volume vulnerable to out of space errors. If the percentage is set to 0%, the administrator must monitor the space usage on the volume and take corrective action.

[`-min-readahead {true|false}`] - Minimum Read Ahead (privilege: advanced)

This optionally specifies whether minimum readahead is used on the volume. The default setting is *false*.

[`-atime-update {true|false}`] - Access Time Update Enabled (privilege: advanced)

This optionally specifies whether the access time on inodes is updated when a file is read. The default setting is *true*.

[`-snapdir-access {true|false}`] - Snapshot Directory Access Enabled

This optionally specifies whether clients have access to `.snapshot` directories. The default setting is *true*.

[`-percent-snapshot-space <percent>`] - Space Reserved for Snapshot Copies

This optionally specifies the amount of space that is reserved on the volume for Snapshot copies. The default setting is 5 percent.

[`-snapshot-policy <snapshot policy>`] - Snapshot Policy

This optionally specifies the Snapshot policy for the volume. The default is the Snapshot policy for all volumes on the Vserver, as specified by the `-snapshot-policy` parameter of the [“vserver create”](#) on page

1514 and “[vserver modify](#)” on page 1516 commands. The schedules associated with the `snapshot-policy` for an Infinite Volume cannot have an interval shorter than hourly. When replacing a `snapshot-policy` on a volume, any existing Snapshot copies on the volume that do not match any of the prefixes of the new `snapshot-policy` will not be deleted. This is because the Snapshot scheduler will not clean up older Snapshot copies if the prefixes do not match. Once the new `snapshot-policy` takes effect, depending on the new retention count, any existing Snapshot copies that continue to use the same prefixes may be deleted. For example, if your existing `snapshot-policy` is setup to retain 150 weekly snapshot copies and you create a new `snapshot-policy` that uses the same prefixes but changes the retention count to 50 snapshot copies. Once the new `snapshot-policy` takes effect it will start deleting older snapshot copies until there are only 50 remaining.

`[-foreground {true|false}] - Foreground Process`

This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the operation completes. This parameter applies only to Infinite Volumes. For FlexVol volumes, the command always runs in the foreground.

`[-nvfail {on|off}] - NVFAIL Option`

Setting this optional parameter to `true` causes the volume to set the in-nvfailed-state flag to `true`, if committed writes to the volume are lost due to a failure. The in-nvfailed-state flag fences the volume from further data access and prevents possible corruption of the application data. Without specifying a value, this parameter is automatically set to `false`.

`[-in-nvfailed-state {true|false}] - Volume's NVFAIL State (privilege: advanced)`

This field is automatically set to `true` on a volume when committed writes to the volume are possibly lost due to a failure, and the volume has the nvfail option enabled. With this field set, the client access to the volume is fenced to protect against possible corruptions that result from accessing stale data. The administrator needs to take appropriate recovery actions to recover the volume from the possible data loss. After the recovery is completed, the administrator can clear this field and restore the client access to the volume. This field can be cleared using the CLI but it cannot be set.

`[-dr-force-nvfail {on|off}] - Force NVFAIL on MetroCluster Switchover`

Setting this optional parameter to `true` on a volume causes the MetroCluster switchover operation to set the in-nvfailed-state flag to `true` on that volume. The in-nvfailed-state flag prevents further data access to the volume. The default value is `false`. This parameter has no effect on a negotiated or an automatic switchover, and is not supported on FlexGroups or Infinite Volumes.

`[-filesystem-size-fixed {true|false}] - Is File System Size Fixed`

This option causes the file system to remain the same size and not grow or shrink when a SnapMirrored volume relationship is broken, or when a volume add is performed on it. It is automatically set to `true` when a volume becomes a SnapMirrored volume. It stays set to `true` after the `snapmirror break` command is issued for the volume. This allows a volume to be SnapMirrored back to the source without needing to add disks to the source volume. If the volume is a traditional volume and the size is larger than the file system size, setting this option to `false` forces the file system to grow to the size of the volume. If the volume is a flexible volume and the volume size is larger than the file system size, setting this option to `false` forces the volume size to equal the file system size. The default setting is `false`.

`[-extent-enabled {off|on|space-optimized}] - (DEPRECATED)-Extent Option`

Note: This parameter has been deprecated and may be removed in a future release of Data ONTAP.

Setting this option to `on` or `space-optimized` enables extents in the volume. This causes application writes to be written in the volume as a write of a larger group of related data blocks called an extent. Using extents may help workloads that perform many small random writes followed by large sequential reads. However, using extents may increase the amount of disk operations performed on the controller, so this option should only be used where this trade-off is desired. If the option is set to `space-optimized` then the reallocation update will not duplicate blocks from Snapshot copies into the active file system, and will result in conservative space utilization. Using `space-optimized` may be useful when the volume has Snapshot copies or is a SnapMirror source, when it can reduce the storage used in the volume and the

amount of data that SnapMirror needs to move on the next update. The `space-optimized` value can result in degraded read performance of Snapshot copies. The default value is `off`; extents are not used.

`[-space-mgmt-try-first {volume_grow|snap_delete}] - Primary Space Management Strategy`

A flexible volume can be configured to automatically reclaim space in case the volume is about to run out of space, by either increasing the size of the volume using `autogrow` or deleting Snapshot copies in the volume using `Snapshot autodelete`. If this option is set to `volume_grow` the system will try to first increase the size of volume before deleting Snapshot copies to reclaim space. If the option is set to `snap_delete` the system will first automatically delete Snapshot copies and in case of failure to reclaim space will try to grow the volume. This parameter is not supported on Infinite Volumes.

`[-read-realloc {off|on|space-optimized}] - Read Reallocation Option`

Setting this option to `on` or `space-optimized` enables read reallocation in the volume. This results in the optimization of file layout by writing some blocks to a new location on disk. The layout is updated only after the blocks have been read because of a user read operation, and only when updating their layout will provide better read performance in the future. Using read reallocation may help workloads that perform a mixture of random writes and large sequential reads. If the option is set to `space-optimized` then the reallocation update will not duplicate blocks from Snapshot copies into the active file system, and will result in conservative space utilization. Using `space-optimized` may be useful when the volume has Snapshot copies or is a SnapMirror source, when it can reduce the storage used in the volume and the amount of data that snapmirror needs to move on the next update. The `space-optimized` value can result in degraded read performance of Snapshot copies. The default value is `off`.

`[-sched-snap-name {create-time|ordinal}] - Naming Scheme for Automatic Snapshot Copies`

This option specifies the naming convention for automatic Snapshot copies. If set to `create-time`, automatic Snapshot copies are named using the format `<schedule_name>.yyyy-mm-dd_hhmm`. Example: "hourly.2010-04-01_0831". If set to `ordinal`, only the latest automatic Snapshot copy is named using the format `<schedule_name>.<n>`. Example: "hourly.0". Older automatic Snapshot copies are named using the format `<schedule_name>.yyyy-mm-dd_hhmm`. Example: "hourly.2010-04-01_0831".

`[-storage-service <storage service name>] - Storage Service Name (privilege: advanced)`

The name of the storage service for the Infinite Volume. This parameter applies to Infinite Volumes only.

`[-unreachable-attr-action {return-generated|wait}] - Action When Attributes Are Not Reachable (privilege: advanced)`

This parameter specifies the information that an Infinite Volume returns when a client lists a directory that contains one or more files with inaccessible attributes, which can happen when a data constituent is not online. When this parameter is set to `return-generated`, the Infinite Volume returns default values for the attributes, which appear to the client as a file size of 0 and timestamps that are in the past. When this parameter is set to `wait`, the Infinite Volume returns a RETRY error, which may cause some clients to hang. When the inaccessible file attributes become available, the Infinite Volume returns them to the client. The default setting is `return-generated`. This parameter applies to Infinite Volumes only.

`[-namespace-aggregate <aggregate name>] - Namespace Aggregate (privilege: advanced)`

The name of the aggregate in which to create the Infinite Volume namespace constituent. If a name is not provided, Data ONTAP picks the aggregate assigned to the Vserver that has the most usable space. This parameter can only be specified for DP Infinite Volumes that do not have an existing namespace constituent. This parameter applies to Infinite Volumes only.

`[-max-namespace-constituent-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of Namespace Constituent (privilege: advanced)`

The maximum size of the namespace constituent. The default value is 10TB. This parameter applies to Infinite Volumes only.

`[-ns-mirror-aggr-list <aggregate name>, ...] - List of Aggregates for Namespace Mirrors (privilege: advanced)`

Specifies the aggregates that can be used to create Infinite Volume namespace mirror constituents. No other aggregate will be chosen for this purpose. Aggregates in this list will remain available for other uses in the Infinite Volume. This parameter applies to Infinite Volumes only.

`[-max-data-constituent-size {<integer>[KB|MB|GB|TB|PB]]` - Maximum Size of Each Data Constituent (privilege: advanced)

This parameter specifies the maximum size of an Infinite Volume data constituent. The default value is determined by checking the maximum FlexVol size setting on all nodes used by the Infinite Volume. The smallest value found is selected as the default for the maximum constituent size. This parameter applies to Infinite Volumes only.

`{ [-qos-policy-group <text>] - QoS Policy Group Name`

This optional parameter specifies which QoS policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a volume, the system will not monitor and control the traffic to it. To remove this volume from a policy group, enter the reserved keyword "none". This parameter is not supported on Infinite Volumes.

`| [-qos-adaptive-policy-group <text>]] - QoS Adaptive Policy Group Name`

This optional parameter specifies which QoS adaptive policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the volume allocated space or used space. To remove this volume from an adaptive policy group, enter the reserved keyword "none". This parameter is not supported on FlexGroups or Infinite Volumes.

`[-caching-policy <text>] - Caching Policy Name`

This parameter specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in a Flash Pool aggregate or Flash Cache modules. This parameter is not supported on Infinite Volumes.

Both metadata and user data are eligible for caching. Metadata consists of directories, indirect blocks and system metafiles. They are eligible for read caching only. When a random write pattern is detected on user data, the first such write is eligible for read caching while all subsequent overwrites are eligible for write caching. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread-random_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta-random_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random_read_write-random_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all_read-random_write - Read caches all metadata, randomly read and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all_read_random_write-random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.

- `all-random_write` - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is `auto`.

`[-cache-retention-priority {normal|low|high}]` - Cache Retention Priority (privilege: advanced)

This parameter specifies the cache retention priority to apply to the volume. A cache retention priority defines how long the blocks of a volume will be cached in flash pool once they become cold. If a cache retention priority is not assigned to this volume, the system uses the default policy. This parameter is not supported on Infinite Volumes.

The available cache retention priority are:

- `low` - Cache the cold blocks for the lowest time.
- `normal` - Cache the cold blocks for the default time.
- `high` - Cache the cold blocks for the highest time.

`[-is-autobalance-eligible {true|false}]` - Is Eligible for Auto Balance Aggregate (privilege: advanced)

If the Auto Balance feature is enabled, this parameter specifies whether the volume might be considered for system workload balancing. When set to `true`, the Auto Balance Aggregate feature might recommend moving this volume to another aggregate. The default value is `true`.

`[-max-constituent-size {<integer>[KB|MB|GB|TB|PB]}]` - Maximum size of a FlexGroup Constituent (privilege: advanced)

This optionally specifies the maximum size of a FlexGroup constituent. The default value is determined by checking the maximum FlexVol size setting on all nodes used by the FlexGroup. The smallest value found is selected as the default for the `-max-constituent-size` for the FlexGroup. This parameter applies to FlexGroups only.

`[-vserver-dr-protection {protected|unprotected}]` - Vserver DR Protection

This optionally specifies whether the volume should be protected by Vserver level SnapMirror. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship. This parameter is not supported on Infinite Volumes.

`[-is-space-reporting-logical {true|false}]` - Logical Space Reporting

This optionally specifies whether to report space logically on the volume. When space is reported logically, ONTAP reports the volume space such that all the physical space saved by the storage efficiency features are also as reported as used. This parameter is not supported on FlexGroups or Infinite Volumes. The default setting is `false`.

`[-tiering-policy {snapshot-only|auto|none|backup}]` - Volume Tiering Policy

This optional parameter specifies the tiering policy to apply to the volume. This policy determines whether the user data blocks of a volume in a FabricPool will be tiered to the capacity tier when they become cold. FabricPool combines flash (performance tier) with an object store (external capacity tier) into a single aggregate. Temperature of a volume block increases if it is accessed frequently and decreases when it is not.

The available tiering policies are:

- `snapshot-only` - This policy allows tiering of only the volume Snapshot copies not associated with the active file system. The default cooling period is 2 days. The `-tiering-minimum-cooling-days` parameter can be used to override the default.
- `auto` - This policy allows tiering of both snapshot and active file system user data to the capacity tier. The default cooling period is 31 days. The `-tiering-minimum-cooling-days` parameter can be used to override the default.
- `none` - Volume blocks will not be tiered to the capacity tier.

- backup - On DP volumes this policy allows all transferred user data blocks to start in the capacity tier.

[-tiering-minimum-cooling-days <integer>] - Volume Tiering Minimum Cooling Days (privilege: advanced)

The parameter specifies the minimum number of days that user data blocks of the volume must be cooled before they can be considered cold and tiered out to the capacity tier. This parameter is only used for tiering purpose and does not affect the reporting of inactive data. The value specified should be greater than the frequency that applications in the volume shift between different sets of data. Valid values are between 2 and 63. You cannot set this parameter on 'none' or 'backup' volume tiering policy.

Examples

The following example modifies a volume named vol4 on a Vserver named vs0. The volume's export policy is changed to default_expolicy and its size is changed to 500 GB.

```
cluster1::> volume modify -vserver vs0 -volume vol4 -policy default_expolicy -size 500g
```

The following example modifies a volume named vol2. It enables autogrow and sets the maximum autosize to 500g

```
cluster1::> volume modify -volume vol2 -autosize-mode grow -max-autosize 500g
```

The following example modifies a volume named vol2 to have a space guarantee of none.

```
cluster1::> volume modify -space-guarantee none -volume vol2
```

The following example modifies all volumes in Vserver vs0 to have a fractional reserve of 30%.

```
cluster1::> volume modify -fractional-reserve 30 -vserver vs0 *
```

The following example modifies a volume named vol2 to grow in size by 5 gigabytes

```
cluster1::> volume modify -volume vol2 -size +5g
```

The following example modifies a volume named vol2 to have a different caching policy. The volume must be on a Flash Pool aggregate.

```
cluster1::> volume modify -volume vol2 -caching-policy none
```

volume mount

Mount a volume on another volume with a junction-path

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume mount` command mounts a volume at a specified junction path.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This specifies the volume that is to be mounted.

-junction-path <junction path> - Junction Path Of The Mounting Volume

This specifies the junction path of the mounted volume. The junction path name is case insensitive and must be unique within a Vserver's namespace.

[-active {true|false}] - Activate Junction Path

This optionally specifies whether the mounted volume is accessible. The default setting is `false`. If the mounted path is not accessible, it does not appear in the Vserver's namespace.

[-policy-override {true|false}] - Override The Export Policy

This optionally specifies whether the parent volume's export policy overrides the mounted volume's export policy. The default setting is `false`.

Examples

The following example mounts a volume named `user_tsmith` on a Vserver named `vs0`. The junction path for the mounted volume is `/user/tsmith`. The mounted volume is accessible, and the mounted volume's export policy is not overridden by the parent volume's export policy.

```
node::> volume mount -vserver vs0 -volume user_tsmith
-junction-path /user/tsmith -active true -policy-override false
```

volume offline

Take an existing volume offline

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume offline` command takes the volume offline. If the volume is already in restricted or `iron_restricted` state, then it is already unavailable for data access, and much of the following description does not apply. The current root volume may not be taken offline. A number of operations being performed on the volume in question can prevent volume offline from succeeding for various lengths of time. If such operations are required, the command may take additional time to complete. If they do not, the command is aborted. The `-force` flag can be used to forcibly offline a volume.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the name of the Vserver from which the volume is to be taken offline. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name

This specifies the name of the volume that is to be taken offline.

[-force | -f [true]] - Force Offline

This specifies whether the offline operation is forced. Using this option to force a volume offline can potentially disrupt access to other volumes. The default setting is `false`.

[-foreground {true|false}] - Foreground Process

This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the operation completes. This parameter applies only to Infinite Volumes. For FlexVol volumes, the command always runs in the foreground.

[-disable-luns-check [true]] - Disable Check for Existing LUNs

Taking the volume offline will make all associated LUNs and NVMe namespaces unavailable, which normally requires a user confirmation. If this parameter is specified, the command proceeds without a confirmation. The default setting is `false`.

Examples

The following example takes the volume named `vol1` offline:

```
cluster1::> volume offline vol1
Volume 'vs1:vol1' is now offline.
```

volume online

Bring an existing volume online

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume online` command brings the volume online. A volume can only be brought online if it is offline or restricted. If the volume is inconsistent but has not lost data, the user will be cautioned and prompted before bringing it online. It is advisable to run `wafli-iron` (or do a `snapmirror initialize` in case of a replica volume) prior to bringing an inconsistent volume online. Bringing an inconsistent volume online increases the risk of further file system corruption. If the containing aggregate cannot honor the space guarantees required by this volume, the volume online operation will fail. It is not advisable to use volumes with their space guarantees disabled. Lack of free space can lead to failure of writes which in turn can appear as data loss to some applications.

Parameters

-vserver <vserver name> - Vserver Name

This parameter specifies the name of the Vserver from which the volume is to be brought online. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume that is to be brought online.

[-force | -f [true]] - Force Online

When this parameter is used, the volume will be brought online even if there is not enough space available in the aggregate to honor the volume's space guarantee.

[-foreground {true|false}] - Foreground Process

This parameter specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the operation completes. This parameter applies only to Infinite Volumes. For FlexVol volumes, the command always runs in the foreground.

Examples

The following example brings a volume named `vol1` online:

```
cluster1::> volume online vol1
Volume 'vs1:vol1' is now online.
```

volume rehost

Rehost a volume from one Vserver into another Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `volume rehost` command rehosts a volume from source Vserver onto destination Vserver. The volume name must be unique among the other volumes on the destination Vserver.

Parameters

-vserver <vserver name> - Source Vserver name

This specifies the Vserver on which the volume is located.

-volume <volume name> - Target volume name

This specifies the volume that is to be rehosted.

-destination-vserver <vserver name> - Destination Vserver name

This specifies the destination Vserver where the volume must be located post rehost operation.

{ [-force-unmap-luns {true|false}] - Unmap LUNs in volume

This specifies whether the rehost operation should unmap LUNs present on volume. The default setting is *false* (the rehost operation shall not unmap LUNs). When set to true, the command will unmap all mapped LUNs on the volume.

| [-auto-remap-luns {true|false}] - Automatic Remap of LUNs

This specifies whether the rehost operation should perform LUN mapping operation at the destination Vserver for the LUNs mapped on the volume at the source Vserver. The default setting is *false* (the rehost operation shall not map LUNs at the destination Vserver). When set to true, at the destination Vserver the command will create initiators groups along with the initiators (if present) with same name as that of source Vserver. Then the LUNs on the volume are mapped to initiator groups at the destination Vserver as mapped in source Vserver.

Examples

The following example rehosts a volume named vol3 on Vserver named vs1 to a destination Vserver named vs2:

```
cluster::> volume rehost -vserver vs1 -volume vol3 -destination-vserver vs2
```

volume rename

Rename an existing volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume rename` command renames a volume. The volume name must be unique among the other volumes on the same Vserver. The `volume rename` command is not supported for FlexGroups.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the volume is located. For a node's root volume, use the name of the node for this parameter.

-volume <volume name> - Volume Name

This specifies the volume that is to be renamed.

-newname <volume name> - Volume New Name

This specifies the volume's new name. A volume's name must start with an alphabetic character (a to z or A to Z) and be 203 or fewer characters in length.

[-foreground {true|false}] - Foreground Process

This specifies whether the operation runs in the foreground. The default setting is *true* (the operation runs in the foreground). When set to true, the command will not return until the operation completes.

This parameter applies only to Infinite Volumes. For FlexVol volumes, the command always runs in the foreground.

Examples

The following example renames a volume named vol3_backup as vol3_save on a Vserver named vs0:

```
node::> volume rename -vserver vs0 -volume vol3_backup -newname vol3_save
```

volume restrict

Restrict an existing volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume restrict` command puts the volume in restricted state. If the volume is online, then it will be made unavailable for data access as described under [“volume offline” on page 1331](#).

Parameters

-vserver <vserver name> - Vserver Name

This specifies the name of the Vserver from which the volume is to be restricted. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name

This specifies the name of the volume that is to be restricted.

[-foreground {true|false}] - Foreground Process

This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the operation completes.

This parameter applies only to Infinite Volumes. For FlexVol volumes, the command always runs in the foreground.

Examples

The following example restricts a volume named `vol1`:

```
cluster1::> volume restrict vol1
Volume 'vs1:vol1' is now restricted.
```

volume show

Display a list of volumes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume show` command displays information about volumes. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all volumes:

- Vserver name
- Volume name
- Aggregate name
- State (online, offline, restricted, or mixed)
- Type (RW for read-write or DP for data-protection)
- Size
- Available size
- Percentage of space used

To display detailed information about a single volume, run the command with the `-vserver` and `-volume` parameters. The detailed view provides all of the information in the previous list and the following additional information:

- Name ordinal
- Volume data set ID
- Volume master data set ID
- Volume style (trad, flex or infinitevol)
- Whether the volume is a Cluster volume or Node volume

- Export policy name
- User ID
- Group ID
- Security style (unix, ntfs, mixed or unified)
- UNIX permissions
- Junction path
- Junction path source
- Whether the junction path is active
- Parent volume name
- Vserver root volume
- Comment
- Filesystem size
- Total user-visible size
- Used size
- Used percentage
- Volume nearly full threshold percent
- Volume full threshold percent
- Autosize enabled
- Maximum autosize
- Minimum autosize
- Autosize grow threshold percent
- Autosize shrink threshold percent
- Autosize mode
- Total files
- Files used
- Expected available size
- Over provisioned size
- Snapshot reserve available size
- Logical used size
- Logical used percent
- Logical available size
- Active filesystem logical used size
- Snapshot copy logical used size
- Use logical space reporting
- Use logical space enforcement
- Maximum directory size
- Space guarantee style
- Whether a space guarantee is in effect
- Space SLO type (none, thick or semi-thick)
- Whether space SLO is in effect
- Whether minimum readahead is enabled

- Whether access time update is enabled
- Whether Snapshot directory access is enabled
- Percentage of space reserved for Snapshot Copies
- Percentage of Snapshot copy space used
- Snapshot policy name
- Creation time
- If the filesystem size is fixed
- Overwrite reserve
- Fractional reserve
- Which space management strategy to try first
- Language
- Whether there's one data volume per member aggregate
- Concurrency level
- Optimization policy
- Whether the volume is a clone
- Volume UUID
- Whether failover is enabled
- Failover state
- (DEPRECATED)-Extent option
- Read reallocation option
- Consistency state
- Whether volume is quiesced on disk
- Whether volume is quiesced in memory
- Whether volume contains shared or compressed data
- Space saved by storage efficiency
- Percentage of space saved by storage efficiency
- Space saved by deduplication
- Percentage of space saved by deduplication
- Space shared by deduplication
- Space saved by compression
- Percentage of space saved by compression
- Volume Size Used by Snapshot Copies
- Caching policy
- FlexGroup master data set ID
- FlexGroup index
- FlexGroup UUID
- Maximum size of the FlexGroup constituent
- Whether the volume has FlexGroup enabled
- Whether a FlexGroup is Qtree enabled
- Whether the volume is the destination of a move that is currently in cutover
- List of the aggregates used by the FlexGroup

- List of the nodes used by the FlexGroup
- SnapLock Type
- Is in pre-commit phase of Copy-Free Transition
- Application that the volume belongs to
- Application UUID

To display detailed information about all volumes, run the command with the `-instance` parameter. Fields not supported by Infinite Volumes will display a value of "-".

You can specify additional parameters to display information that matches only those parameters. For example, to display information only about data-protection volumes, run the command with the `-type DP` parameter.

Parameters

{ [-fields <fieldname>, ...]

This specifies the fields that need to be displayed. The fields `Vserver` and `policy` are the default fields (see example).

| [-encryption]

If this parameter is specified, the command displays the following information:

- Vserver name
- Volume name
- Aggregate name
- Volume state
- Encryption state

| [-junction]

If this parameter is specified, the command displays the following information:

- Vserver name
- Volume name
- Whether the volume's junction is active
- Junction path
- Junction path source (if the volume is a mirror)

| [-settings] (privilege: advanced)

If this parameter is specified, the command displays the following information:

- Vserver name
- Volume name
- Whether minimum readahead is enabled on the volume
- Whether the access time is updated on inodes when a file on the volume is read
- Whether clients have access to `.snapshot` directories
- Whether automatic Snapshot copies are enabled on the volume

| [-instance]}

If this parameter is specified, the command displays information about all entries.

[-vserver <vserver name>] - Vserver Name

If this parameter and the `-volume` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

[-volume <volume name>] - Volume Name

If this parameter and the `-vserver` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes matching the specified name.

[-aggregate <aggregate name>] - Aggregate Name

If this parameter is specified, the command displays information only about the volume or volumes that are located on the specified storage aggregate. This field is displayed as "-" for FlexGroups.

[-aggr-list <aggregate name>, ...] - List of Aggregates for FlexGroup Constituents

If this parameter is specified, the command displays information only about the FlexGroup or FlexGroups that are located on the specified list of storage aggregates. This parameter applies to FlexGroups only.

[-size <integer>[KB|MB|GB|TB|PB]] - Volume Size

If this parameter is specified, the command displays information only about the volume or volumes that have the specified size. Size is the maximum amount of space a volume can consume from its associated aggregate(s), including user data, metadata, Snapshot copies, and Snapshot reserve. Note that for volumes without a `-space-guarantee` of *volume*, the ability to fill the volume to this maximum size depends on the space available in the associated aggregate or aggregates.

[-name-ordinal <text>] - Name Ordinal (privilege: advanced)

If this parameter is specified, it denotes the ordinal assignment used in relation to this volume's name. Ordinals are used to disambiguate volumes that have the same base name on the same controller. A value of "0" indicates that the base volume name is unique on the controller. A value greater than zero indicates that the volume's base name is used by two or more volumes on the same controller, and that appending "(n)" to this volume's name uniquely identifies it on this controller.

[-dsid <integer>] - Volume Data Set ID

If this parameter is specified, the command displays information only about the volume or volumes that match the specified data set ID. This field is displayed as "-" for FlexGroups.

[-msid <integer>] - Volume Master Data Set ID

If this parameter is specified, the command displays information only about the volume or volumes that match the specified master data set ID.

[-state {online|restricted|offline|force-online|force-offline|mixed}] - Volume State

If this parameter is specified, the command displays information only about the volume or volumes that have the specified state. The *mixed* state only applies to FlexGroups and Infinite Volumes. If the state of a FlexGroup or Infinite Volume is *mixed*, that indicates that not all of the constituents are in the same state. If this is the case use the "volume show -is-constituent true" command to find out which constituents are not in the proper state.

[-volume-style {flex|infinitevol}] - Volume Style

If this parameter is specified, the command displays information only about the volumes that have the specified style. Possible values are *flex* for FlexVol volumes, and *infinitevol* for Infinite Volumes.

[-volume-style-extended {flexvol|infinitevol|infinitevol-constituent|flexgroup|flexgroup-constituent}] - Extended Volume Style

If this parameter is specified, the command displays information only about the volumes that are configured with the specified extended style. Possible values are *flexvol* for FlexVol volumes, *infinitevol* for Infinite Volumes, *infinitevol-constituent* for Infinite Volume constituents, *flexgroup* for FlexGroups and *flexgroup-constituent* for FlexGroup constituents.

[-is-cluster-volume {true|false}] - Is Cluster-Mode Volume

If this parameter is specified, the command displays information only about cluster volumes (true) or node root volumes and other node scoped volumes (false).

[-is-constituent {true|false}] - Is Constituent Volume

If this parameter is specified, the command displays information only about volumes that either are or are not constituents of a FlexGroup or Infinite Volume, depending on the value provided.

[-policy <text>] - Export Policy

If this parameter is specified, the command displays information only about the volume or volumes that use the specified export policy.

[-user <user name>] - User ID

If this parameter is specified, the command displays information only about the volume or volumes whose root is owned by the specified user.

[-group <group name>] - Group ID

If this parameter is specified, the command displays information only about the volume or volumes whose root is owned by the specified group.

[-security-style <security style>] - Security Style

If this parameter is specified, the command displays information only about the volume or volumes that have the specified security style (*unix* for UNIX mode bits, *ntfs* for CIFS ACLs, *mixed* for both styles or *unified* for Unified UNIX, NFS and CIFS permissions).

[-unix-permissions <unix perm>] - UNIX Permissions

If this parameter is specified, the command displays information only about the volume or volumes whose default UNIX permissions match the specified permissions. Specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX *ls* command (for example, -rwxr-x---). For information on UNIX permissions, see the UNIX or Linux documentation.

[-junction-path <junction path>] - Junction Path

If this parameter is specified, the command displays information only about the volume or volumes that have the specified junction path.

[-junction-path-source {RW_volume|LS_mirror}] - Junction Path Source

If this parameter is specified, the command displays information only about the volume or volumes that have the specified junction path source.

[-junction-active {true|false}] - Junction Active

If this parameter is specified, the command displays information only about the volume or volumes whose junction paths have the specified status.

[-junction-parent <volume name>] - Junction Parent Volume

If this parameter is specified, the command displays information only about the volume or volumes that have the specified parent volume.

[-vsroot {true|false}] - Vserver Root Volume (privilege: advanced)

If this parameter is specified, the command displays information only about the volume or volumes that match the specified setting; that is, whether they are the root volumes for their Vservers.

[-comment <text>] - Comment

If this parameter is specified, the command displays information only about the volume or volumes that match the specified comment text.

[-available {<integer>[KB|MB|GB|TB|PB]] - Available Size

If this parameter is specified, the command displays information only about the volume or volumes that have the specified available size. Available is the amount of free space currently available to be used by this volume. For a volume with a *-space-guarantee* of type *volume*, available is always *-total* minus *-used*. For volumes that do not have a *-space-guarantee* of type *volume*, available could be reduced if the volume's associated aggregate or aggregates are space constrained.

[-filesystem-size {<integer>[KB|MB|GB|TB|PB]] - Filesystem Size

If this parameter is specified, the command displays information only about the volume or volumes that have the specified filesystem size. Filesystem size is the same as the volume's *-size* unless the volume is

or was a physical replica destination. In this case, the file system size corresponds to the `-size` of the source volume, until `-filesystem-size-fixed` is set to `false`.

`[-total {<integer>[KB|MB|GB|TB|PB]]` - Total User-Visible Size

If this parameter is specified, the command displays information only about the volume or volumes that have the specified total size. Total is the total space available for user data and file system metadata. It does not include the Snapshot reserve.

`[-used {<integer>[KB|MB|GB|TB|PB]]` - Used Size

If this parameter is specified, the command displays information only about the volume or volumes that have the specified used size. Used is the amount of space occupied by user data and file system metadata. It includes Snapshot spill (the amount of space by which Snapshot copies exceed Snapshot reserve). It does not include the Snapshot reserve.

`[-percent-used <percent>]` - Used Percentage

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of used space. This row is based on a value of used space that includes the space used by Snapshot copies or the Snapshot reserve (whichever is greater) in relation to the current volume size.

`[-space-nearly-full-threshold-percent <percent>]` - Volume Nearly Full Threshold Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified nearly full threshold percent.

`[-space-full-threshold-percent <percent>]` - Volume Full Threshold Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified full threshold percent.

`[-max-autosize {<integer>[KB|MB|GB|TB|PB]]` - Maximum Autosize

If this parameter is specified, the command displays information only about the volume or volumes that have the specified maximum automatic size.

`[-min-autosize {<integer>[KB|MB|GB|TB|PB]]` - Minimum Autosize

If this parameter is specified, the command displays information only about the volume or volumes that have the specified minimum automatic size. This field is displayed as "-" for FlexGroups.

`[-autosize-grow-threshold-percent <percent>]` - Autosize Grow Threshold Percentage

If this parameter is specified, the command displays information only about the volume or volumes that have the specified automatic grow used space threshold percentage. This field is displayed as "-" for FlexGroups.

`[-autosize-shrink-threshold-percent <percent>]` - Autosize Shrink Threshold Percentage

If this parameter is specified, the command displays information only about the volume or volumes that have the specified automatic shrink used space threshold percentage. This field is displayed as "-" for FlexGroups.

`[-autosize-mode {off|grow|grow_shrink}]` - Autosize Mode

If this parameter is specified, the command displays information only about the volume or volumes that have the specified automatic sizing mode setting. This field is displayed as "-" for FlexGroups.

`[-files <integer>]` - Total Files (for user-visible data)

If this parameter is specified, the command displays information only about the volume or volumes that have the specified number of files.

`[-files-used <integer>]` - Files Used (for user-visible data)

If this parameter is specified, the command displays information only about the volume or volumes that have the specified number of files used.

`[-maxdir-size {<integer>[KB|MB|GB|TB|PB]]` - Maximum Directory Size (privilege: advanced)

If this parameter is specified, the command displays information only about the volume or volumes that have the specified maximum directory size.

[-space-guarantee-enabled {true|false}] - Space Guarantee in Effect

If this parameter is specified, the command displays information only about the volume or volumes that have the specified space-guarantee setting. If the value of `-space-guarantee` is *none*, the value of `-space-guarantee-enabled` is always *true*. In other words, because there is no guarantee, the guarantee is always in effect. If the value of `-space-guarantee` is *volume*, the value of `-space-guarantee-enabled` can be *true* or *false*, depending on whether the guaranteed amount of space was available when the volume was mounted.

[-is-space-slo-enabled {true|false}] - Space SLO in Effect

If this parameter is specified, the command displays information only about the volume or volumes that have their `space-slo` setting in effect or not, depending on the value specified for this parameter. If the value of `space-slo` is *none*, the space SLO is always considered to be in effect. If the value of `space-slo` is *semi-thick* or *thick*, the space SLO may be in effect depending on whether the required amount of space was available when the volume was mounted.

[-space-slo {none|thick|semi-thick}] - Space SLO

If this parameter is specified, the command displays information only about the volume or volumes that have the specified `space-slo` setting. The space SLO setting is the Service Level Objective for space management for the volume.

[-space-guarantee | -s {none|volume}] - Space Guarantee Style

If this parameter is specified, the command displays information only about the volume or volumes that have the specified space guarantee style. If the value of `-space-guarantee` is *none*, the value of `-space-guarantee-enabled` is always *true*. In other words, because there is no guarantee, the guarantee is always in effect. If the value of `-space-guarantee` is *volume*, the value of `-space-guarantee-enabled` can be *true* or *false*, depending on whether the guaranteed amount of space was available when the volume was mounted.

[-fractional-reserve <percent>] - Fractional Reserve

If this parameter is specified, the command displays information only about the volume or volumes that have the specified `fractional-reserve` setting.

[-type {RW|DP}] - Volume Type

If this parameter is specified, the command displays information only about the volume or volumes of the specified volume type (RW for read-write or DP for data-protection).

[-min-readahead {true|false}] - Minimum Read Ahead (privilege: advanced)

If this parameter is specified, the command displays information only about the volume or volumes that have the specified `minimum-readahead` setting.

[-atime-update {true|false}] - Access Time Update Enabled (privilege: advanced)

If this parameter is specified, the command displays information only about the volume or volumes that have the specified `access-time update` setting.

[-snapdir-access {true|false}] - Snapshot Directory Access Enabled

If this parameter is specified, the command displays information only about the volume or volumes that have the specified `Snapshot-copy access` setting.

[-percent-snapshot-space <percent>] - Space Reserved for Snapshot Copies

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space reserved for Snapshot copies.

[-snapshot-space-used <percent_no_limit>] - Snapshot Reserve Used

If this parameter is specified, the command displays information only about the volume or volumes that have the specified used percentage of the reserve for Snapshot copies.

[-snapshot-policy <snapshot policy>] - Snapshot Policy

If this parameter is specified, the command displays information only about the volume or volumes that use the specified Snapshot policy.

[-create-time <Date>] - Creation Time

If this parameter is specified, the command displays information only about the volume or volumes that have the specified creation time.

[-language <Language code>] - Language

If this parameter is specified, the command displays information only about the volume or volumes that store data in the specified language. To determine the available languages, enter `volume show-language?` at the clustershell command prompt.

[-clone-volume {true|false}] - Clone Volume

If this parameter is specified, the command displays information only about volumes that are clones (true) or not clones (false).

[-node {<nodename>|local}] - Node name

If this parameter is specified, the command displays information only the volume or volumes that are located on the specified storage system. This field is displayed as "-" for FlexGroups.

[-clone-parent-vserver <vserver name>] - Clone Parent Vserver Name

If this parameter is specified, the command displays information only about the volumes with a matching FlexClone parent Vserver name.

[-clone-parent-name <volume name>] - FlexClone Parent Volume

If this parameter is specified, the command displays information only about the volumes with a matching FlexClone parent volume name.

[-uuid <UUID>] - UUID of the Volume (privilege: advanced)

If this parameter is specified, the command displays information only about the volume or volumes that match the specified UUID.

[-nvfail {on|off}] - NVFAIL Option

If this parameter is specified, the command displays information only about volumes for which failover is enabled (on) or disabled (off).

[-in-nvfailed-state {true|false}] - Volume's NVFAIL State

If this parameter is specified, the command displays information only about volumes which are in the failed over state (true) or not (false).

[-dr-force-nvfail {on|off}] - Force NVFAIL on MetroCluster Switchover

If this parameter is specified, the command displays information only about volumes for which dr-force-nvfail is enabled (on) or disabled (off).

[-filesystem-size-fixed {true|false}] - Is File System Size Fixed

If this parameter is specified, the command displays information only about the volume or volumes that have the specified `filesystem-size-fixed` setting.

[-extent-enabled {off|on|space-optimized}] - (DEPRECATED)-Extent Option

Note: This parameter has been deprecated and may be removed in a future release of Data ONTAP.

If this parameter is specified, the command displays information only about volumes that have extents enabled (on), not enabled (off) or space optimized (space-optimized).

[-overwrite-reserve {<integer>[KB|MB|GB|TB|PB]}] - Reserved Space for Overwrites

If this parameter is specified, the command displays information only about the volume or volumes that have the specified `overwrite-reserve` setting.

[-space-mgmt-try-first {volume_grow|snap_delete}] - Primary Space Management Strategy

If this parameter is specified, the command displays information only about the volume or volumes that have the specified `space-mgmt-try-first` setting. Possible values are `volume_grow` and `snap_delete`. This field is displayed as "-" for FlexGroups.

[-read-realloc {off|on|space-optimized}] - Read Reallocation Option

If this parameter is specified, the command displays information only about volumes that have read reallocation enabled (on), not enabled (off) or space optimized (space-optimized).

[-sched-snap-name {create-time|ordinal}] - Naming Scheme for Automatic Snapshot Copies

If this parameter is specified, the command displays information only about the volume or volumes that have the specified automatic Snapshot-copy naming convention.

[-is-inconsistent {true|false}] - Inconsistency in the File System

If this parameter is specified, the command displays information only about volumes that are inconsistent (true) or consistent (false) in the file system.

[-is-quieted-on-disk {true|false}] - Is Volume Quiesced (On-Disk)

If this parameter is specified, the command displays information only about volumes that are quiesced (true) or not quiesced (false) on disk.

[-is-quieted-in-memory {true|false}] - Is Volume Quiesced (In-Memory)

If this parameter is specified, the command displays information only about volumes that are quiesced (true) or not quiesced (false) in memory.

[-transition-state <state>] - Transition Operation State (privilege: advanced)

If this parameter is specified, the command displays information only about the volume or volumes that match the specified transition state.

[-transition-behavior {data-move|data-protection|none}] - Transition Behavior (privilege: advanced)

If this parameter is specified, the command displays information only about the volume or volumes that match the specified transition behavior. Possible values are:

- data-move: Volumes that are being moved from a system operating in 7-Mode.
- data-protection: Volumes that are being replicated from a system operating in 7-Mode for disaster recovery.
- none: Volumes that are not part of transition.

[-is-copied-for-transition {true|false}] - Copied for Transition (privilege: advanced)

If this parameter is specified, the command displays information only about the volume or volumes that match the specified value based on whether the volume is copied for transition or not.

[-is-transitioned {true|false}] - Transitioned (privilege: advanced)

If this parameter is specified, the command displays information only about the volume or volumes that match the specified value based on whether the volume is transitioned or not.

[-is-sis-volume {true|false}] - Volume Contains Shared or Compressed Data

If this parameter is specified, the command displays information only about those volumes that match the specified storage efficiency setting. Infinite Volumes will report the aggregated setting of their constituent data volumes as *true* or *false* if all constituents have the same setting, otherwise no value will be reported.

[-sis-space-saved {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Storage Efficiency

If this parameter is specified, the command displays information only about those volumes that have the specified amount of space saved by the storage efficiency technology.

[-sis-space-saved-percent <percent>] - Percentage Saved by Storage Efficiency

If this parameter is specified, the command displays information only about those volumes that have the specified percentage of space saved by the storage efficiency technology.

[-dedupe-space-saved {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Deduplication

If this parameter is specified, the command displays information only about those volumes that have the specified amount of space saved due to deduplication.

[-dedupe-space-saved-percent <percent>] - Percentage Saved by Deduplication

If this parameter is specified, the command displays information only about those volumes that have the specified percentage of space saved due to deduplication.

[-dedupe-space-shared {<integer>[KB|MB|GB|TB|PB]}] - Space Shared by Deduplication

If this parameter is specified, the command displays information only about those volumes that have the specified amount of shared space due to deduplication.

[-compression-space-saved <integer>[KB|MB|GB|TB|PB]] - Space Saved by Compression

If this parameter is specified, the command displays information only about those volumes that have the specified amount of space saved due to compression.

[-compression-space-saved-percent <percent>] - Percentage Space Saved by Compression

If this parameter is specified, the command displays information only about those volumes that have the specified percentage of space saved due to compression.

[-size-used-by-snapshots <integer>[KB|MB|GB|TB|PB]] - Volume Size Used by Snapshot Copies

If this parameter is specified, the command displays information about those volumes that have the specified volume size used by Snapshot copies.

[-block-type {64-bit|extent|32-bit}] - Block Type

If this parameter is specified, the command displays information about only the volumes with the specified indirect block format. Possible values are *32-bit* to display 32-bit volumes and *64-bit* to display 64-bit volumes.

[-is-moving {true|false}] - Is Volume Moving

If this parameter is specified, the command displays information only about volumes that are moving (true) or not moving (false).

[-hybrid-cache-eligibility {read|read-write}] - Flash Pool Caching Eligibility

If this parameter is specified, the command displays information only about the volume or volumes with the specified Flash Pool caching attributes. Possible caching attributes are:

- 'read' ... Indicates that the volume cannot participate in write caching.
- 'read-write' ... Indicates that the volume can participate in read and write caching.

[-hybrid-cache-write-caching-ineligibility-reason <text>] - Flash Pool Write Caching Ineligibility Reason

If this parameter is specified, the command displays information only about the volume or volumes which are ineligible to participate in write caching due to the specified reason.

[-is-managed-by-service {true|false}] - Managed By Storage Service

If this parameter is specified as *true*, only display volumes that are managed by storage services. This field is displayed as "-" for FlexGroups.

[-storage-service <storage service name>] - Storage Service Name

If this parameter is specified, the command displays information only about volumes that match the specified storage service.

[-enable-snapdiff {true|false}] - Create Namespace Mirror Constituents For SnapDiff Use

Setting this parameter displays information only about Infinite Volumes that either do or do not have namespace mirror constituents for SnapDiff use, depending on the value provided. This parameter applies to Infinite Volumes only.

[-unreachable-attr-action {return-generated|wait}] - Action When Attributes Are Not Reachable

This parameter specifies the information that an Infinite Volume returns when a client lists a directory that contains one or more files with inaccessible attributes. If this parameter is specified, the command displays information only about volumes that match the specified action. This parameter is not supported for FlexVol volumes.

[-constituent-role <Constituent Roles>] - Constituent Volume Role

If this parameter is specified, the command displays information only about the constituent volume or volumes that are of the specified role. This parameter applies to Infinite Volumes and FlexGroups only.

[-directory-bitwidth <integer>] - Directory Bit Width

If this parameter is specified, the command displays information only about the volume or volumes with a directory bitwidth of the specified value. This parameter applies to Infinite Volumes only.

[-max-namespace-constituent-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of Namespace Constituent

If this parameter is specified, the command displays information only about volumes that match the specified namespace constituent size.

[-max-data-constituent-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of Each Data Constituent

If this parameter is specified, the command displays information only about the Infinite Volume or Infinite Volumes that have the specified maximum data constituent size. This parameter applies to Infinite Volumes only.

[-is-cft-precommit {true|false}] - Is in the precommit phase of Copy-Free Transition (privilege: advanced)

If this parameter is specified with the true value, it displays information only about the volumes that are in the precommit phase of a Copy-Free Transition workflow.

[-qos-policy-group <text>] - QoS Policy Group Name

If this parameter is specified, the command displays information only about volumes that match the specified QoS policy group.

[-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name

If this parameter is specified, the command displays information only about volumes that match the specified QoS adaptive policy group.

[-caching-policy <text>] - Caching Policy Name

If this parameter is specified, the command displays the volumes that match the specified caching policy.

A caching policy defines how the system caches a volume's data in a Flash Pool aggregate. Both metadata and user data are eligible for caching. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread-random_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta-random_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random_read_write-random_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all_read-random_write - Read caches all metadata, randomly read and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all_read_random_write-random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data. It also write caches randomly overwritten user data blocks.

- `all-random_write` - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is `auto`.

`[-cache-retention-priority {normal|low|high}]` - Cache Retention Priority (privilege: advanced)

If this parameter is specified, the command displays the volumes that match the specified cache retention priority policy.

A cache retention priority defines how long the blocks of a volume will be cached in flash pool once they become cold. This parameter is not supported on Infinite Volumes. The available cache retention priority are:

- `low` - Cache the cold blocks for the lowest time.
- `normal` - Cache the cold blocks for the default time.
- `high` - Cache the cold blocks for the highest time.

`[-is-volume-in-cutover {true|false}]` - Is Volume Move in Cutover Phase

If this parameter is specified, the command displays information only about volumes that are in the cutover phase (`true`) or not in the cutover phase (`false`) of a volume move. This field is displayed as "-" for FlexGroups.

`[-snapshot-count <integer>]` - Number of Snapshot Copies in the Volume

If this parameter is specified, the command displays information only about the volumes that have the specified number of Snapshot copies.

`[-vbn-bad-present {true|false}]` - VBN_BAD may be present in the active filesystem

If this parameter is specified, the command displays information only about volumes that may have VBN_BAD present in its active filesystem (`true`) or do not have VBN_BAD present in its active filesystem (`false`).

`[-is-autobalance-eligible {true|false}]` - Is Eligible for Auto Balance Aggregate (privilege: advanced)

If this parameter is specified, the command displays information only about the volume or volumes that are eligible for consideration by the Auto Balance Aggregate feature.

`[-is-vol-on-hybrid-aggr {true|false}]` - Is Volume on a hybrid aggregate

If this parameter is specified, the command displays information only about volumes associated with a Flash Pool aggregate (`true`) or not (`false`). This field is displayed as "-" for FlexGroups.

`[-physical-used <integer>[KB|MB|GB|TB|PB]]` - Total Physical Used Size

If this parameter is specified, the command displays information only about the volume or volumes that have the specified physical used size. This differs from *total-used* space by the space that is reserved for future writes. The value includes blocks in use by Snapshot copies.

`[-physical-used-percent <percent_no_limit>]` - Physical Used Percentage

If this parameter is specified, the command displays information only about the volume or volumes that have the specified physical used percent based on volume size including the space reserved for Snapshot copies.

`[-flexgroup-msid <integer>]` - FlexGroup Master Data Set ID (privilege: advanced)

If this parameter is specified, the command displays information only about the FlexGroup or FlexGroup constituents that have the specified FlexGroup master data-set ID. This parameter applies to FlexGroups and FlexGroup constituents only.

`[-flexgroup-index <integer>]` - FlexGroup Index (privilege: advanced)

If this parameter is specified, the command displays information only about the FlexGroup constituents that have the specified FlexGroup index. This parameter applies to FlexGroup constituents only.

`[-flexgroup-uuid <UUID>]` - UUID of the FlexGroup (privilege: advanced)

If this parameter is specified, the command displays information only about the FlexGroup or FlexGroup constituents that have the specified FlexGroup UUID. This parameter applies to FlexGroups and FlexGroup constituents only.

[-max-constituent-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum size of a FlexGroup Constituent (privilege: advanced)

If this parameter is specified, the command displays information only about the FlexGroup or FlexGroups that have the specified maximum constituent size. This parameter applies to FlexGroups only.

[-inofile-version <integer>] - Infile Version (privilege: advanced)

If this parameter is specified, the command displays information only about the volumes whose inode files are at the specified version.

[-nodes {<nodename>|local}, ...] - List of Nodes

If this parameter is specified, the command displays information only about the FlexGroup or FlexGroups that are located on the specified list of storage systems. This parameter applies to FlexGroups only.

[-is-flexgroup {true|false}] - Is Volume a FlexGroup

If this parameter is specified, the command displays information only about the volume or volumes that are either FlexGroups or not, depending on the value provided.

[-is-flexgroup-qtree-enabled {true|false}] - Is FlexGroup Qtree Support Enabled (privilege: advanced)

If this parameter is specified, the command displays information only about the FlexGroups with Qtrees enabled or disabled, depending on the value provided.

[-is-move-destination-in-cutover {true|false}] - Is the Volume a Target of a Move Which Is Currently in Cutover (privilege: advanced)

If this parameter is specified, the command displays whether or not the volume is a move destination that is currently in cutover.

[-snaplock-type {non-snaplock|compliance|enterprise}] - SnapLock Type

If this parameter is specified, the command displays information only about volumes that match the specified snaplock-type.

[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection

If this parameter is specified, the command displays information only about the volumes having the specified Vserver Snapmirror protection. This parameter is not supported on Infinite Volumes.

[-encrypt {true}] - Enable Encryption

If this parameter is specified, the command displays information only about the volumes that are encrypted.

[-is-encrypted {true|false}] - Is Volume Encrypted

If this parameter is specified, the command displays information only about the volumes that are encrypted (true) or not encrypted (false).

[-encryption-state {none|full|partial|converting_to_encrypted|converting_to_plaintext|rekeying}] - Volume Encryption State

If this parameter is specified, the command displays information only about the volumes that have the specified encryption state. The possible values are *none*, *full*, and *partial*. The value *partial* is used for FlexGroups, which indicates that some constituents are encrypted and some are not. If this parameter is specified, the command displays the encryption state of the volume.

[-key-id <text>] - Encryption Key ID

If this parameter is specified, the command displays information only about the volume whose encryption key-id matches the specified key-id.

[-application <text>] - Application

Selects the volumes that are part of an application that matches the parameter value.

[-single-instance-data-logging {off|on}] - Is SIDL enabled

If this parameter is specified, the command displays whether Single Instance Data Logging feature is enabled on the specified volume.

[-over-provisioned {<integer>[KB|MB|GB|TB|PB]]] - Over Provisioned Size

If this parameter is specified, the command displays information only about the volume or volumes that have the specified size not available in the aggregate. This applies only for a 'none' guaranteed volume when it's unused size exceeds available space in the aggregate. This value is always zero for 'volume' guaranteed volumes. This parameter is not supported on Infinite Volumes.

[-snapshot-reserve-available {<integer>[KB|MB|GB|TB|PB]]] - Available Snapshot Reserve Size

If this parameter is specified, the command displays information only about the volume or volumes that have the specified size available for Snapshot copies within the Snapshot reserve. This value is zero if Snapshot spill is present. For 'none' guaranteed volumes, this may get reduced due to less available space in the aggregate. This parameter is not supported on Infinite Volumes.

[-logical-used {<integer>[KB|MB|GB|TB|PB]]] - Logical Used Size

If this parameter is specified, the command displays information only about the volume or volumes that have the specified logical used size. This value includes all the space saved by the storage efficiency features along with the physically used space. This does not include Snapshot reserve but does consider Snapshot spill. This parameter is not supported on FlexGroups or Infinite Volumes.

[-logical-used-percent <percent_no_limit>] - Logical Used Percentage

If this parameter is specified, the command displays information only about the volume or volumes that have the specified logical used percentage. This parameter is not supported on FlexGroups or Infinite Volumes.

[-logical-available {<integer>[KB|MB|GB|TB|PB]]] - Logical Available Size

If this parameter is specified, the command displays information only about the volume or volumes that have the specified logical available size. This value is the amount of free space currently available considering space saved by the storage efficiency features as being used. This does not include Snapshot reserve. This parameter is not supported on FlexGroups or Infinite Volumes.

[-logical-used-by-afs {<integer>[KB|MB|GB|TB|PB]]] - Logical Size Used by Active Filesystem

If this parameter is specified, the command displays information only about the volume or volumes that have the specified logical size used by the active file system. This value differs from *logical-used* by the amount of Snapshot spill that exceeds Snapshot reserve. This parameter is not supported on FlexGroups or Infinite Volumes.

[-logical-used-by-snapshots {<integer>[KB|MB|GB|TB|PB]]] - Logical Size Used by All Snapshots

If this parameter is specified, the command displays information only about the volume or volumes that have the specified logical size used across all Snapshot copies. This value differs from *size-used-by-snapshots* by the space saved by the storage efficiency features across the Snapshot copies. This parameter is not supported on FlexGroups or Infinite Volumes.

[-is-space-reporting-logical {true|false}] - Logical Space Reporting

If this parameter is specified, the command displays information only about the volumes that have logical space reporting enabled or disabled as specified. When space is reported logically, ONTAP reports the volume space such that all the physical space saved by the storage efficiency features are also as reported as used. This parameter is not supported on FlexGroups or Infinite Volumes.

[-tiering-policy {snapshot-only|auto|none|backup}] - Volume Tiering Policy

If this parameter is specified, the command displays information only about the volumes whose tiering policy matches the specified value. Tiering policies determine whether the user data blocks of a volume in a FabricPool will be tiered to the capacity tier when they become cold. FabricPool combines flash (performance tier) with an object store (external capacity tier) into a single aggregate. Temperature of a volume block increases if it is accessed frequently and decreases when it is not.

The available tiering-policies are:

- snapshot-only - This policy allows tiering of only the volume Snapshot copies not associated with the active file system.
- auto - This policy allows tiering of both snapshot and active file system user data to the capacity tier.
- none - Volume blocks will not be tiered to the capacity tier.
- backup - On DP volumes this policy allows all transferred user data blocks to start in the capacity tier.

[-tiering-minimum-cooling-days <integer>] - Volume Tiering Minimum Cooling Days (privilege: advanced)

This parameter displays the minimum number of days that user data blocks of the volume must be cooled before they can be considered cold and tiered out to the capacity tier. If a value is not displayed then the system default is still being used and has not been overridden with this option. The default minimum cooling period for snapshot-only policy is 2 days and for auto policy is 31 days.

[-performance-tier-inactive-user-data {<integer>[KB|MB|GB|TB|PB]] - Performance Tier Inactive User Data

If this parameter is specified, the command displays the amount of inactive user data stored in the performance tier that could be tiered out to a capacity tier if the volume is in a FabricPool and has the auto tiering policy. For more information see the tiering-policy parameter.

[-performance-tier-inactive-user-data-percent <percent>] - Performance Tier Inactive User Data Percent

If this parameter is specified, the command displays the percentage of inactive user data in the performance tier.

Examples

The following example displays information about all volumes on the Vserver named vs1:

```
cluster1::> volume show -vserver vs1
```

Vserver	Volume	Aggregate	State	Type	Size	Available	Used%
vs1	vol1	aggr1	online	RW	2GB	1.9GB	5%
vs1	vol1_dr	aggr0_dp	online	DP	200GB	160.0GB	20%
vs1	vol2	aggr0	online	RW	150GB	110.3GB	26%
vs1	vol2_dr	aggr0_dp	online	DP	150GB	110.3GB	26%
vs1	vol3	aggr1	online	RW	150GB	120.0GB	20%
vs1	vol3_dr	aggr1_dp	online	DP	150GB	120.0GB	20%
vs1	vol4	aggr1	online	RW	200GB	159.8GB	20%
vs1	vol4_dr	aggr1_dp	online	DP	200GB	159.8GB	20%
vs1	vol5	aggr2	online	RW	200GB	102.3GB	48%
vs1	vol5_dr	aggr2_dp	online	DP	200GB	102.3GB	48%
vs1	vol6	aggr2	online	RW	150GB	117.2GB	21%
vs1	vol6_dr	aggr2_dp	online	DP	150GB	117.2GB	21%
vs1	vol7	aggr3	online	RW	150GB	118.5GB	20%
vs1	vol7_dr	aggr3_dp	online	DP	150GB	118.5GB	20%
vs1	vol8	aggr3	online	RW	150GB	90.03GB	39%
vs1	vol8_dr	aggr3_dp	online	DP	150GB	90.03GB	39%
vs1	vol9	aggr4	online	RW	150GB	43.67GB	70%
vs1	vol9_dr	aggr4_dp	online	DP	150GB	43.67GB	70%
vs1	vol10	aggr4	online	RW	150GB	108.7GB	27%
vs1	vol10_dr	aggr4_dp	online	DP	150GB	108.7GB	27%
vs1	vol11	aggr5	online	RW	250GB	45.65GB	81%
vs1	vol11_dr	aggr5_dp	online	DP	250GB	45.65GB	81%

22 entries were displayed.

The following example displays detailed information about a volume named vol1 on an SVM named vs1:

```
cluster1::*> volume show -vserver vs1 -volume vol1
```

```

```

volume show-footprint

Display a list of volumes and their data and metadata footprints in their associated aggregate.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume show-footprint` command displays information about the space used in associated aggregates by volumes and features enabled in volumes. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all volumes. The `volume show-footprint` command is not supported for Infinite Volumes. However, the command displays information about Infinite Volume constituents as if the constituents were FlexVol volumes. If the associated aggregates have an object-store attached to them, then the command displays a more detailed split up of the space used in each tier. This additional information is useful to show per-tier space usage which can be used to estimate the space requirements and transfer duration when moving a volume to a different tier with “[volume move](#)” on [page 1428](#).

Parameters

[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If this parameter and the `-volume` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

[-volume <volume name>] - Volume Name

If this parameter and the `-vserver` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes matching the specified name.

[-volume-msid <integer>] - Volume MSID

If this parameter is specified, the command displays information only about the volume that has the specified MSID.

[-volume-dsid <integer>] - Volume DSID

If this parameter is specified, the command displays information only about the volume that has the specified DSID.

[-vserver-uuid <UUID>] - Vserver UUID

If this parameter is specified, the command displays information only about the volume on the vserver which has the specified UUID.

[-aggregate <aggregate name>] - Aggregate Name

If this parameter is specified, the command displays information only about the volumes that are associated with the specified aggregate.

[-aggregate-uuid <UUID>] - Aggregate UUID

If this parameter is specified, the command displays information only about the volumes on the aggregate which have the specified UUID.

[-hostname <text>] - Hostname

If this parameter is specified, the command displays information only about the volumes that belong to the specified host.

[-tape-backup-metafiles-footprint {<integer>[KB|MB|GB|TB|PB]}] - Tape Backup Metadata Footprint

If this parameter is specified, the command displays information only about the volumes whose tape backup metafiles use the specified amount of space in the aggregate.

[-tape-backup-metafiles-footprint-percent <percent>] - Tape Backup Metadata Footprint Percent

If this parameter is specified, the command displays information only about the volumes whose tape backup metafiles use the specified percentage of space in the aggregate.

[-dedupe-metafiles-footprint {<integer>[KB|MB|GB|TB|PB]}] - Deduplication Footprint

If this parameter is specified, the command displays information only about the volumes whose deduplication metafiles use the specified amount of space in the aggregate.

[-dedupe-metafiles-footprint-percent <percent>] - Deduplication Footprint Percent

If this parameter is specified, the command displays information only about the volumes whose deduplication metafiles use the specified percentage of space in the aggregate.

[-dedupe-metafiles-temporary-footprint {<integer>[KB|MB|GB|TB|PB]}] - Temporary Deduplication Footprint

If this parameter is specified, the command displays information only about the volumes whose temporary deduplication metafiles use the specified amount of space in the aggregate.

[-dedupe-metafiles-temporary-footprint-percent <percent>] - Temporary Deduplication Footprint Percent

If this parameter is specified, the command displays information only about the volumes whose temporary deduplication metafiles use the specified percentage of space in the aggregate.

[-cross-volume-dedupe-metafiles-footprint {<integer>[KB|MB|GB|TB|PB]}] - Cross Volume Deduplication Footprint

If this parameter is specified, the command displays information only about the volumes whose cross volume deduplication metafiles use the specified amount of space in the aggregate.

[-cross-volume-dedupe-metafiles-footprint-percent <percent>] - Cross Volume Deduplication Footprint Percent

If this parameter is specified, the command displays information only about the volumes whose cross volume deduplication metafiles use the specified percentage of space in the aggregate.

[-cross-volume-dedupe-metafiles-temporary-footprint {<integer>[KB|MB|GB|TB|PB]}] - Cross Volume Temporary Deduplication Footprint

If this parameter is specified, the command displays information only about the volumes whose cross volume deduplication temporary metafiles use the specified amount of space in the aggregate.

[-cross-volume-dedupe-metafiles-temporary-footprint-percent <percent>] - Cross Volume Temporary Deduplication Footprint Percent

If this parameter is specified, the command displays information only about the volumes whose cross volume deduplication temporary metafiles use the specified percentage of space in the aggregate.

[-volume-blocks-footprint {<integer>[KB|MB|GB|TB|PB]}] - Volume Data Footprint

If this parameter is specified, the command displays information only about the volumes whose data blocks use the specified amount of space in the aggregate.

This field is the total amount of data written to the volume. It includes data in the active file system in the volume as well as data that is consumed by volume Snapshot copies. This row only includes data and not reserved space, so when volumes have reserved files, the volume's total used in the [“volume show-space” on page 1356](#) command output can exceed the value in this row.

[-volume-blocks-footprint-percent <percent>] - Volume Data Footprint Percent

If this parameter is specified, the command displays information only about the volumes whose data blocks use the specified percentage of space in the aggregate.

[-flexvol-metadata-footprint {<integer>[KB|MB|GB|TB|PB]}] - Flexible Volume Metadata Footprint

If this parameter is specified, the command displays information only about the volumes whose file system metadata uses the specified amount of space in the aggregate.

This field includes the space used or reserved in the aggregate for metadata associated with this volume.

[-flexvol-metadata-footprint-percent <percent>] - Flexible Volume Metadata Footprint Percent

If this parameter is specified, the command displays information only about the volumes whose file system metadata uses the specified percentage of space in the aggregate.

[-delayed-free-footprint {<integer>[KB|MB|GB|TB|PB]}] - Delayed Free Blocks

If this parameter is specified, the command displays information only about the volumes whose delayed free blocks use the specified amount of space in the aggregate.

When Data ONTAP frees space in a volume, this space is not always immediately shown as free in the aggregate. This is because the operations to free the space in the aggregate are batched for increased performance. Blocks that are declared free in the FlexVol volume but which are not yet free in the aggregate are called "delayed free blocks" until the associated delayed free blocks are processed. For SnapMirror destinations, this row will have a value of 0 and will not be displayed.

[-delayed-free-footprint-percent <percent>] - Delayed Free Blocks Percent

If this parameter is specified, the command displays information only about the volumes that have the specified amount of blocks waiting to be freed in the aggregate. This space is called "delayed free blocks".

[-snapmirror-destination-footprint {<integer>[KB|MB|GB|TB|PB]}] - SnapMirror Destination Footprint

If this parameter is specified, the command displays information only about the volumes whose SnapMirror transfer uses the specified amount of space in the aggregate.

During a SnapMirror transfer, this row will include incoming SnapMirror data and SnapMirror-triggered delayed free blocks from previous SnapMirror transfers.

[-snapmirror-destination-footprint-percent <percent>] - SnapMirror Destination Footprint Percent

If this parameter is specified, the command displays information only about the volumes whose SnapMirror transfer uses the specified percentage of space in the aggregate.

[-volume-guarantee-footprint {<integer>[KB|MB|GB|TB|PB]}] - Volume Guarantee

If this parameter is specified, the command displays information only about the volumes whose guarantees use the specified amount of space in the aggregate.

This field includes the amount of space reserved by this volume in the aggregate for future writes. The amount of space reserved depends on the guarantee type (the provisioning mode) of the volume. For a

"volume" guaranteed volume, this is the size of the volume minus the amount in the Volume Data Footprint row. For a "file" guaranteed volume, this is the sum of all of the space reserved for hole fills and overwrites in all of the space reserved files in the volume.

[-volume-guarantee-footprint-percent <percent>] - Volume Guarantee Percent

If this parameter is specified, the command displays information only about the volumes whose guarantees use the specified percentage of space in the aggregate.

[-file-operation-metadata {<integer>[KB|MB|GB|TB|PB]}] - File Operation Metadata

If this parameter is specified, the command displays information only about the volumes that have file operation metadata using the specified amount of space in the aggregate.

This metadata is used by file move and copy operations. Although it is not returned as free space once the operations are complete, it can be reused by future file operations.

[-file-operation-metadata-percent <percent>] - File Operation Metadata Percent

If this parameter is specified, the command displays information only about the volumes that have file operation metadata using the specified percentage of space in the aggregate.

[-total-footprint {<integer>[KB|MB|GB|TB|PB]}] - Total Footprint

If this parameter is specified, the command displays information only about the volumes which use the specified amount of space in the aggregate. This field is the sum of the other rows in this table.

[-total-footprint-percent <percent>] - Total Footprint Percent

If this parameter is specified, the command displays information only about the volumes which use the specified percentage of space in the aggregate.

[-aggregate-size {<integer>[KB|MB|GB|TB|PB]}] - Containing Aggregate Size

If this parameter is specified, the command displays information only about the volumes that are associated with an aggregate of the specified size.

[-bin0-name <text>] - Name for bin0

If this parameter is specified, the command displays information only about volumes whose associated aggregate has an object store attached to it with an active file system tier name matches the specified value.

[-volume-blocks-footprint-bin0 {<integer>[KB|MB|GB|TB|PB]}] - Volume Footprint for bin0

If this parameter is specified, the command displays information only about volumes whose space in use in the performance tier of the aggregate matches the specified value.

[-volume-blocks-footprint-bin0-percent <percent>] - Volume Footprint bin0 Percent

If this parameter is specified, the command displays information only about volumes whose percentage space in use in the performance tier of the aggregate matches the specified value.

[-bin1-name <text>] - Name for bin1

If this parameter is specified, the command displays information only about volumes whose associated aggregate has an external capacity tier attached to it with a configuration name that matches the specified value.

[-volume-blocks-footprint-bin1 {<integer>[KB|MB|GB|TB|PB]}] - Volume Footprint for bin1

If this parameter is specified, the command displays information only about volumes whose space in use in the first external capacity tier bucket attached to the associated aggregate matches the specified value. This includes the space used by the blocks in the volume that are staged before being moved to the capacity tier.

[-volume-blocks-footprint-bin1-percent <percent>] - Volume Footprint bin1 Percent

If this parameter is specified, the command displays information only about volumes whose percentage space in use in the first external capacity tier bucket attached to associated aggregate matches the specified value. This includes the space used by the blocks in the volume that are staged before being moved to the capacity tier.

Examples

The following example displays information about all volumes in the system.

```
cluster1::> volume show-footprint
```

```
Vserver : nodevs  
Volume  : vol0
```

volume show-space

Display space usage for volume(s)

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume show-space` command displays information about space usage within the volume. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all volumes. The `volume show-space` command is not supported for Infinite Volumes; however, the command displays information about Infinite Volume constituents as if the constituents were FlexVol volumes.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If this parameter and the `-volume` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

[-volume <volume name>] - Volume Name

If this parameter and the `-vserver` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes matching the specified name.

[-volume-msid <integer>] - Volume MSID

If this parameter is specified, the command displays information only about the volume that has the specified MSID.

[-volume-dsid <integer>] - Volume DSID

If this parameter is specified, the command displays information only about the volume that has the specified DSID.

[-vserver-uuid <UUID>] - Vserver UUID

If this parameter is specified, the command displays information only about the volume on the vserver which has the specified UUID.

[-aggregate <aggregate name>] - Aggregate Name

If this parameter is specified, the command displays information only about the volumes that are associated with the specified aggregate.

[-aggregate-uuid <UUID>] - Aggregate UUID

If this parameter is specified, the command displays information only about the volumes on the aggregate which have the specified UUID.

[-hostname <text>] - Hostname

If this parameter is specified, the command displays information only about the volumes that belong to the specified host.

[-user-data {<integer>[KB|MB|GB|TB|PB]}] - User Data

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by user data in the volume.

This is the amount of data written to the volume via CIFS, NFS or SAN protocols plus the metadata (for example indirect blocks, directory blocks) directly associated with user files plus the space reserved in the volume for these files (hole and overwrite reserves). This is the same information displayed by running the Unix `du` command on the mount point.

[-user-data-percent <percent_no_limit>] - User Data Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by user data in the volume.

[-dedupe-metafiles {<integer>[KB|MB|GB|TB|PB]}] - Deduplication

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by deduplication metafiles in the volume.

[-dedupe-metafiles-percent <percent>] - Deduplication Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by deduplication metafiles in the volume.

[-dedupe-metafiles-temporary {<integer>[KB|MB|GB|TB|PB]}] - Temporary Deduplication

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by temporary deduplication metafiles in the volume.

[-dedupe-metafiles-temporary-percent <percent>] - Temporary Deduplication Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by temporary deduplication metafiles in the volume.

[-filesystem-metadata {<integer>[KB|MB|GB|TB|PB]}] - Filesystem Metadata

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by file system metadata in the volume.

`[-filesystem-metadata-percent <percent>]` - Filesystem Metadata Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by file system metadata in the volume.

`[-snapmirror-metadata {<integer>[KB|MB|GB|TB|PB]}]` - SnapMirror Metadata

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by SnapMirror metafiles in the volume.

Between SnapMirror transfers, some metadata is maintained to support storage-efficient transfers. During transfers, some additional space is used temporarily. This space is used in all SnapMirror destination volumes.

`[-snapmirror-metadata-percent <percent>]` - SnapMirror Metadata Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by SnapMirror metafiles inside the volume.

`[-tape-backup-metadata {<integer>[KB|MB|GB|TB|PB]}]` - Tape Backup Metadata

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by tape backup metafiles in the volume.

`[-tape-backup-metadata-percent <percent>]` - Tape Backup Metadata Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by tape backup metafiles in the volume.

`[-quota-metafiles {<integer>[KB|MB|GB|TB|PB]}]` - Quota Metadata

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by quota metafiles.

`[-quota-metafiles-percent <percent>]` - Quota Metadata Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by quota metafiles.

`[-inodes {<integer>[KB|MB|GB|TB|PB]}]` - Inodes

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the inode metafile in the volume.

This is the amount of space required to store inodes in the file system and is proportional to the maximum number of files ever created in the volume. The inode file is not compacted or truncated, so if a large number of files are created and then deleted, the inode file does not shrink.

`[-inodes-percent <percent>]` - Inodes Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the inode metafile in the volume.

`[-inodes-upgrade {<integer>[KB|MB|GB|TB|PB]}]` - Inodes Upgrade

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the inode subsystem for the purpose of upgrading.

This is the amount of space required to store upgrading inodes in the file system and is proportional to the size of the inode metafile. Once the upgrade is complete, the space used by 'inodes' will be replaced with the space used for upgrade.

`[-inodes-upgrade-percent <percent>]` - Inodes Upgrade Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use for upgrading the inode metafile in the volume.

`[-snapshot-reserve {<integer>[KB|MB|GB|TB|PB]}]` - Snapshot Reserve

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the Snapshot reserve in the volume.

`[-snapshot-reserve-percent <percent>]` - Snapshot Reserve Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the Snapshot reserve in the volume.

[-snapshot-reserve-unusable {<integer>[KB|MB|GB|TB|PB]] - Snapshot Reserve Unusable

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space reserved but unusable in the volume.

Snapshot reserve can be diminished under certain conditions to accomodate volume metadata. Creating space in the volume will make this space available.

[-snapshot-reserve-unusable-percent <integer>] - Snapshot Reserve Unusable Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space reserved but unusable.

[-snapshot-spill {<integer>[KB|MB|GB|TB|PB]] - Snapshot Spill

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by their Snapshot spill.

If Snapshot used space exceeds the Snapshot reserve it is considered to spill out of the reserve. This space cannot be used by the active file system until Snapshots are deleted.

[-snapshot-spill-percent <percent>] - Snapshot Spill Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the Snapshot spill.

[-performance-metadata {<integer>[KB|MB|GB|TB|PB]] - Performance Metadata

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use for performance optimization in the volume.

[-performance-metadata-percent <percent>] - Performance Metadata Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use for performance optimization in the volume.

[-total-used {<integer>[KB|MB|GB|TB|PB]] - Total Used

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the volume, including the space used by the Snapshot reserve.

This is equivalent to the used field in the output of the [“volume show” on page 1334](#) command.

[-total-used-percent <percent_no_limit>] - Total Used Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the volume, including the space used by the Snapshot reserve.

[-physical-used {<integer>[KB|MB|GB|TB|PB]] - Total Physical Used Size

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of physical space in use by the volume.

This differs from *total-used* space by the space that is reserved for future writes. The value includes blocks in use by Snapshot copies.

[-physical-used-percent <percent_no_limit>] - Physical Used Percentage

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of physical space in use in the volume based on volume size including the space reserved for Snapshot copies.

[-logical-used {<integer>[KB|MB|GB|TB|PB]] - Logical Used Size

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of logical space in use by the volume. This includes space saved by all the

storage efficiency features along with physical used space. This does not include Snapshot reserve but does consider Snapshot spill.

[-logical-used-percent <percent_no_limit>] - Logical Used Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of logical space used in the volume.

[-logical-available {<integer>[KB|MB|GB|TB|PB]] - Logical Available

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of logical available space in the volume.

Examples

The following example shows how to display details for all volumes.

```
cluster1::> volume show-space
```

```
Vserver : nodevs
Volume  : vol0
```

Feature	Used	Used%
-----	-----	-----
User Data	163.4MB	3%
Filesystem Metadata	172KB	0%
Inodes	2.93MB	0%
Snapshot Reserve	292.9MB	5%
Total Used	459.4MB	8%
Total Physical Used	166.4MB	3%

```
Vserver : thevs
Volume  : rootvol
```

Feature	Used	Used%
-----	-----	-----
User Data	100KB	0%
Filesystem Metadata	76KB	0%
Inodes	24KB	0%
Snapshot Reserve	1MB	5%
Total Used	1.20MB	6%
Total Physical Used	200KB	1%

```
Vserver : vs1
Volume  : vol1
```

Feature	Used	Used%
-----	-----	-----
User Data	180.8MB	74%
Filesystem Metadata	280KB	0%
Inodes	12KB	0%
Snapshot Reserve	12.20MB	5%
Total Used	193.3MB	79%
Total Physical Used	192.9MB	79%

3 entries were displayed.

The following example shows all Volumes that have a snap reserve greater than 2 MB:

```
cluster1::> volume show-space -snapshot-reserve >2m
```

Vserver : nodevs
Volume : vol0

Feature	Used	Used%
-----	-----	-----
User Data	163.4MB	3%
Filesystem Metadata	172KB	0%
Inodes	2.93MB	0%
Snapshot Reserve	292.9MB	5%
Total Used	459.4MB	8%

Filesystem Metadata	280KB	0%
Inodes	12KB	0%
Snapshot Reserve	12.20MB	5%
Total Used	193.3MB	79%
Total Physical Used	192.9MB	79%

2 entries were displayed.

volume size

Set/Display the size of the volume.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume size` command allows the user to set or display the volume size. If *new-size* is not specified then the current volume size is displayed.

Parameters

-vserver <vserver name> - Vserver Name

This parameter can be used to specify the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This parameter specifies the volume for which the user wants to set or display the size.

[-new-size <text>] - [+|-]<New Size>

This optional parameter specifies the size of the volume. It can be used to set the volume size to a particular number or grow/shrink the size by a particular amount. The size is specified as a number (preceded with a sign for relative growth/shrinkage) followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit designation is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. The minimum size for a flexible volume is 20 MB, and the maximum size depends on hardware platform and free space in the containing aggregate. If the volume's space guarantee is currently disabled, its size cannot be increased. This parameter is not supported on Infinite Volumes that are managed by storage services.

Examples

The following example shows the size of a volume called vol1.

```
cluster1::> vol size vol1
(volume size)
vol size: Flexible volume 'vs1:vol1' has size 2g.
The following example sets the size of a volume called vol1 to 1GB.

cluster1::> vol size vol1 1g
(volume size)
vol size: Flexible volume 'vs1:vol1' size set to 1g.
The following example increases the size of a volume called vol1 by 500MB.

cluster1::> vol size vol1 +500m
(volume size)
vol size: Flexible volume 'vs1:vol1' size set to 1.49g.
The following example decreases the size of a volume called vol1 by 250MB.

cluster1::> vol size vol1 -250m
(volume size)
vol size: Flexible volume 'vs1:vol1' size set to 1.24g.
```

volume transition-prepare-to-downgrade

Verifies that there are no volumes actively transitioning from 7-mode to clustered Data ONTAP, and configures the transition feature for downgrade.

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `volume transition-prepare-to-downgrade` command is used to verify that a volume is not currently being transitioned from 7-Mode to clustered Data ONTAP. This check must be done before reverting or downgrading a node.

Examples

volume unmount

Unmount a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume unmount` command unmounts a volume from its parent volume. The volume can be remounted at the same or a different location by using the [“volume mount” on page 1330](#) command.

Parameters

-vserver <vserver name> - Vserver Name
This specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name
This specifies the volume that is to be unmounted.

Examples

The following example unmounts a volume named vol2 on a Vserver named vs0:

```
node::> volume unmount -vserver vs0 -volume vol2
```

volume aggregate commands

Manage Infinite Volume aggregate operations

volume aggregate vacate

(DEPRECATED)-Move all Infinite Volume constituents from one aggregate to another.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `volume aggregate vacate` command moves all constituents belonging to a given Infinite Volume from the source aggregate to the destination aggregate.

The `volume aggregate vacate` command is only supported for Infinite Volumes.

Note: Infinite Volumes are deprecated and support for them may be removed in a future release of Data ONTAP. If you are using Infinite Volumes it is recommended that you do not upgrade the cluster to a release that is later than Data ONTAP 9.3.0.

Parameters

-vserver <vserver name> - Vserver Name

The name of the Vserver that owns the volume.

-volume <volume name> - Volume Name

The name of the volume.

-source-aggregate <aggregate name> - Source Aggregate

The source aggregate from which all Infinite Volume constituents are being moved.

-destination-aggregate <aggregate name> - Destination Aggregate

The destination aggregate to which the Infinite Volume constituents are being moved.

[-foreground | -w {true|false}] - Foreground Process

This specifies whether the operation runs as a foreground process. If this parameter is not specified, the default setting is *false* (the operation runs in the background). When set to *true*, the command will not return until the process completes.

Examples

The following example moves all constituents of Infinite Volume `repo_vol` from `aggr1` to `aggr2`.

```
cluster1::> volume aggregate vacate -vserver vs0 -volume repo_vol -source-aggregate aggr1 -destination-aggregate aggr2
```

volume clone commands

Manage FlexClones

volume clone create

Create a FlexClone volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume clone create` command creates a FlexClone volume on the aggregate containing the specified parent volume. This command is only supported for flexible volumes. The maximum volume clone hierarchy depth is 500 and the default depth is 60. You can optionally specify the following attributes for the new FlexClone volume:

- Vserver on which the parent volume resides
- Name of the FlexClone parent snapshot

- Junction path where FlexClone volume should be mounted
- State of the junction path
- Space guarantee style (none, volume or file)
- Comment
- Whether the `volume clone create` command runs as a foreground or background process

Parameters

-vserver <vserver name> - Vserver Name

This parameter specifies the Vserver on which the FlexClone volume is to be created. If only one data Vserver exists, you do not need to specify this parameter.

-flexclone <volume name> - FlexClone Volume

This parameter specifies the name of the FlexClone volume. The name must be unique within the hosting Vserver.

[-type {RW|DP}] - FlexClone Type

This parameter specifies the type of FlexClone volume. A read-only FlexClone volume is created if you specify the *type* as DP; otherwise a read-write FlexClone volume is created.

[-parent-vserver <vserver name>] - FlexClone Parent Vserver

This parameter specifies the name of the Vserver to which the FlexClone parent volume belongs. If it is different from the Vserver on which the FlexClone volume is to be created, then the FlexClone volume inherits the export policies from the residing Vserver, and not from the FlexClone parent volume.

-parent-volume | -b <volume name> - FlexClone Parent Volume

This parameter specifies the name of parent volume from which the FlexClone clone volume is derived.

[-parent-snapshot <snapshot name>] - FlexClone Parent Snapshot

This specifies the name of the parent snapshot from which the FlexClone clone volume is derived.

[-junction-path <junction path>] - Junction Path

This specifies the junction path at which the new FlexClone clone volume should be mounted.

[-junction-active {true|false}] - Junction Active

This optionally specifies whether the volume's junction path is active. The default setting is `true`. If the junction path is inactive, the volume does not appear in the Vserver's namespace. This parameter is available only at the advanced privilege level and higher.

[-space-guarantee | -s {none|volume}] - Space Guarantee Style

This optionally specifies the space guarantee style for the FlexClone volume. A value of *volume* reserves space on the aggregate for the entire volume. A value of *none* reserves no space on the aggregate, meaning that writes can fail if the aggregate runs out of space. The default setting is inherited from the parent volume.

[-comment <text>] - Comment

This optionally specifies a comment for the FlexClone volume.

[-foreground {true|false}] - Foreground Process

This optionally specifies whether the FlexClone volume create operation runs as a foreground process. The default setting is `true` (that is, the operation runs in the foreground).

{ [-qos-policy-group <text>] - QoS Policy Group Name

This parameter optionally specifies which QoS policy group to apply to the FlexClone volume. The policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to the FlexClone volume, the system does not monitor and control the traffic to the volume.

| [-qos-adaptive-policy-group <text>]] - QoS Adaptive Policy Group Name

This optionally specifies which QoS adaptive policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the volume allocated space or used space. This parameter is not supported on FlexGroups or Infinite Volumes.

[-caching-policy <text>] - Caching Policy Name

This optionally specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. This parameter is not supported on Infinite Volumes. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread-random_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta-random_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random_read_write-random_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all_read-random_write - Read caches all metadata, randomly read, and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all_read_random_write-random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.
- all-random_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is auto.

[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection

This optionally specifies whether the volume should be protected by Vserver level SnapMirror. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship. By default the clone volume will inherit this value from the parent volume. This parameter is not supported on Infinite Volumes.

[-uid <integer>] - Volume-Level UID

This parameter optionally specifies a volume-level user ID (UID). All files and directories in a FlexClone volume will inherit this UID.

[-gid <integer>] - Volume-Level GID

This parameter optionally specifies a volume-level group ID (GID). All files and directories in a FlexClone volume will inherit this GID.

Examples

volume clone show

Display a list of FlexClones

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume clone show` command displays information about FlexClone clone volumes. This command is only supported for flexible volumes. By default, the command displays the following information about all FlexClone volume clones:

- Vserver name
- FlexClone volume name
- Parent volume name
- Parent snapshot name
- Whether a FlexClone volume is online or offline

To display detailed information about all FlexClone volumes, run the command with the `-instance` parameter.

Parameters

{ **[-fields <fieldname>, ...]**

Selects the fields to be displayed.

| **[-estimate]**

Displays an estimate of the free disk space required in the aggregate to split the indicated clone volume from its underlying parent volume. The value reported may differ from the space actually required to perform the split, especially if the clone volume is changing when the split is being performed.

| **[-instance]**

Displays detailed information about FlexClone volumes. If `-flexclone` is also specified, the command displays detailed information about the FlexClone volume.

[-vserver <vserver name>] - Vserver Name

Selects summary information for the FlexClone volumes on the specified Vserver. If `-flexclone` is also specified, the command displays detailed information about the specified FlexClone volume.

[-flexclone <volume name>] - FlexClone Volume

Selects summary information for the specified FlexClone volume. If `-vserver` is also specified, the command displays detailed information about the specified FlexClone volume.

[-type {RW|DP}] - FlexClone Type

Selects information for the specified type of FlexClone volume. The type can be specified as either read-only (DP) or read-write (RW).

[-parent-vserver <vserver name>] - FlexClone Parent Vserver

Selects summary information for the FlexClone volumes that are clone volumes in the specified parent Vserver.

[-parent-volume | -b <volume name>] - FlexClone Parent Volume

Selects summary information for the FlexClone volumes that are clones of the specified parent volume.

[-parent-snapshot <snapshot name>] - FlexClone Parent Snapshot

Selects summary information for the FlexClone volumes that are clones of the parent volume to which the specified snapshot belongs.

[-state {online|restricted|offline|force-online|force-offline|mixed}] - FlexClone Volume State

Selects summary information for the FlexClone volumes that are in the specified state.

[-junction-path <junction path>] - Junction Path

Selects summary information for the FlexClone volumes that have the specified junction path.

[-junction-active {true|false}] - Junction Active

Selects summary information for the FlexClone volumes that have the specified junction path status.

[-space-guarantee | -s {none|volume}] - Space Guarantee Style

If this parameter is specified, the command displays information only about the volumes that have the specified space guarantee style.

[-space-guarantee-enabled {true|false}] - Space Guarantee In Effect

Selects summary information for the FlexClone volumes that have the specified space-guarantee setting.

[-aggregate <aggregate name>] - FlexClone Aggregate

Selects summary information for the FlexClone volumes that reside on the specified storage aggregate.

[-dsid <integer>] - FlexClone Data Set ID

Selects summary information for the FlexClone volumes that have the specified Data Set ID.

[-msid <integer>] - FlexClone Master Data Set ID

Selects summary information for the FlexClone volumes that have the specified Master Data Set ID.

[-size {<integer>[KB|MB|GB|TB|PB]] - FlexClone Size

Selects summary information for the FlexClone volumes that have the specified size.

[-used {<integer>[KB|MB|GB|TB|PB]] - Used Size

Selects summary information for the FlexClone volumes that have the specified amount of used space.

[-split-estimate {<integer>[KB|MB|GB|TB|PB]] - Split Estimate

Selects summary information for the FlexClone volumes that require the specified amount of free disk space for splitting from the parent.

[-inodes-processed <integer>] - Inodes Processed

Selects summary information for the FlexClone volumes that have the specified number of Inodes processed for splitting the FlexClone volume from its parent volume.

[-inodes-total <integer>] - Total Inodes

Selects summary information for the FlexClone volumes that have the specified number of total Inodes.

[-inode-percentage-complete <integer>] - Inode Percentage Complete

Selects summary information for the FlexClone volumes that have specified percentage of Inodes processed for splitting the FlexClone volume from its parent volume.

[-blocks-scanned <integer>] - Blocks Scanned

Selects summary information for the FlexClone volumes that have the specified number of blocks scanned for splitting the FlexClone volume from its parent volume.

[-blocks-updated <integer>] - Blocks Updated

Selects summary information for the FlexClone volumes that have the specified number of blocks updated for after splitting the FlexClone volume from its parent volume.

[-comment <text>] - Comment

Selects summary information for the FlexClone volumes that have the specified comment.

[-qos-policy-group <text>] - QoS Policy Group Name

Selects summary information for the FlexClone volumes that have the specified QoS policy group.

[-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name

Selects summary information for the FlexClone volumes that have the specified QoS adaptive policy group.

[-caching-policy <text>] - Caching Policy Name

This optionally specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. This parameter is not supported on Infinite Volumes. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread-random_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta-random_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random_read_write-random_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all_read-random_write - Read caches all metadata, randomly read, and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all_read_random_write-random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.
- all-random_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is auto.

[-parent-vol-type <volAccessType>] - Parent volume type (privilege: advanced)

Selects summary information for the FlexClone volumes that are clones of the parent volumes with the specified type.

[-flexclone-used-percent <percent>] - FlexClone Used Percentage

Selects summary information for the FlexClone volumes that have the specified percentage of used space.

[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection

Selects summary information for the FlexClone volumes that have the specified type of Vserver SnapMirror protection. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship.

[-block-percentage-complete <integer>] - Block Percentage Complete

Selects summary information for the FlexClone volumes that have specified percentage of Blocks processed for splitting the FlexClone volume from its parent volume.

[-uid <integer>] - Volume-Level UID

Selects summary information for the FlexClone volumes that are created with the specified volume-level UID.

[-gid <integer>] - Volume-Level GID

Selects summary information for the FlexClone volumes that are created with the specified volume-level GID.

Examples

volume clone sharing-by-split commands

Commands to get physical block sharing information after FlexClone split

volume clone sharing-by-split show

Show the split flexclone volumes with shared physical blocks

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `volume clone sharing-by-split show` command displays the split volumes with shared physical blocks. This command is only supported for flexible volumes. By default, this command displays the following information:

- Node Name
- Vserver Name
- Volume Name
- Aggregate Name
- Volume State

Parameters

[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node Name

This parameter selects information about the split volumes with shared physical blocks on this node.

[-vserver <Vserver Name>] - Vserver Name

This parameter selects information about the split volumes with shared physical blocks on this Vserver.

[-volume <volume name>] - Volume Name

This parameter selects information about shared physical blocks for this volume.

[-aggregate <aggregate name>] - Aggregate Name

This parameter specifies the aggregate associated with the given volume.

Examples

The following example displays the split volumes with shared physical blocks in the node:

```
cluster1::> volume clone sharing-by-split show -node node1
Node      Vserver   Volume      Aggregate
-----
node1     vs1       vol_clone1  aggr1
```

The following example displays information about volume `vol_clone1` residing on vserver `vs1`:

```
cluster1::> volume clone sharing-by-split show -node node1 -vserver vs1 -volume vol_clone1 -instance

Node Name: node1
Vserver Name: vs1
Volume Name: vol_clone1
Aggregate Name: aggr1
```

volume clone sharing-by-split undo commands

Commands to undo physical block sharing after FlexClone split

volume clone sharing-by-split undo show

Show the status of volume clone undo-sharing operations in-progress

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `volume clone sharing-by-split undo show` command displays the progress information of undo-sharing in the split volumes with shared physical blocks. This command is only supported for flexible volumes. By default, the command displays the following information:

- Vserver name
- Volume name
- Total number of blocks scanned for undo sharing
- Total number of blocks present
- Percentage of blocks processed

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

This parameter selects information about the ongoing undo-sharing scan for all volumes on this Vserver.

[-volume <volume name>] - Volume Name

This parameter selects information about the ongoing undo-sharing scan on this volume.

[-blocks-scanned <integer>] - Scanned Blocks

This parameter selects information about the total number of blocks scanned by undo-sharing in the given volume.

[-blocks-total <integer>] - Total Blocks

This parameter selects information about the total number of blocks for the undo-sharing to scan in the given volume.

[-blocks-percentage-complete <integer>] - Blocks Percentage Complete

This parameter selects information about the percentage of block processing completed by undo-sharing in the given volume.

Examples

The following example displays information about all the ongoing undo-sharing scan in the cluster:

```
cluster1::> volume clone sharing-by-split undo show
```

Vserver	Volume	Blocks Scanned	Blocks Total	Blocks % Complete
vs1	vol_clone1	0	1260	0

The following example displays information about volume *vol_clone1* residing on vservers *vs1*:

```
cluster1::> volume clone sharing-by-split undo show -vserver vs1 -volume vol_clone1 -instance

      Vserver Name: vs1
      Volume Name: vol_clone1
      Blocks Scanned: 0
      Blocks Total: 1260
Block Percentage complete: 0
```

volume clone sharing-by-split undo start

Undo the physical block sharing in split FlexClone volumes

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `volume clone sharing-by-split undo start` command starts a scan to undo the shared physical blocks in the given volume. The volume will be available for the duration of the undo-sharing operation. After the scan starts, you can stop it using the [“volume clone sharing-by-split undo stop” on page 1372](#) command. You can monitor the current progress of the scan using the [“volume clone sharing-by-split undo show” on page 1370](#) command. This command is supported for flexible volumes that were split from their parent volumes.

Parameters

-vserver <Vserver Name> - Vserver Name

This parameter specifies the vservers that the volume exists on.

-volume <volume name> - Volume Name

This parameter specifies the split volume with shared physical blocks, in which the sharing will be undone.

Examples

The following example starts the scan to undo the physical block sharing in volume *vol_clone1* on vservers *vs1*:

```
cluster1::> volume clone sharing-by-split undo start -vserver vs1 -volume vol_clone1
```

volume clone sharing-by-split undo start-all

Undo the physical block sharing in split FlexClone volumes across the cluster

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `volume clone sharing-by-split undo start-all` command starts a scan to undo the shared physical blocks in all the relevant volumes across the cluster. The volumes will be available for the duration of the undo-sharing operation. You can monitor the current progress of the scan using the [“volume clone sharing-by-split undo show” on page 1370](#) command. This command is supported for flexible volumes that were split from their parent volumes.

Examples

The following example starts the scan to undo the physical block sharing in all volumes across the cluster:

```
cluster1::> volume clone sharing-by-split undo start-all
```

volume clone sharing-by-split undo stop

Stop an ongoing undo-sharing operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `volume clone sharing-by-split undo stop` command stops the process of reverting the shared physical blocks from the split volume. If you restart the undo-sharing operation, scan begins from the beginning because no information about previously achieved progress is saved, but previously unshared blocks are not processed again. This command is only supported for flexible volumes.

Parameters

-vserver <Vserver Name> - Vserver Name

This parameter specifies the vservers that the volume exists on.

-volume <volume name> - Volume Name

This parameter specifies the volume whose unsharing of blocks will be stopped.

Examples

The following example stops an ongoing undo-sharing scan for volume `vol_clone1` on vservers `vs1`:

```
cluster1::> volume clone sharing-by-split undo stop -vserver vs1 -volume vol_clone1
```

volume clone split commands

Commands to manage FlexClone split

volume clone split estimate

Estimates the space required by the containing aggregate to split the FlexClone volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume clone split estimate` command displays an estimate of the free disk space required in the aggregate to split the indicated clone volume from its underlying parent volume. The value reported might differ from the space actually required to perform the split, especially if the clone volume is changing when the split is being performed. This command is only supported for flexible volumes.

Parameters

[-vserver <vserver name>] - Vserver Name

This specifies the estimates for free disk space required for splitting FlexClone volumes residing on this Vserver. If the `-flexclone` option is also specified, then the command displays the free disk space estimate only for the specified FlexClone volume residing on the specified Vserver.

[-flexclone <volume name>] - FlexClone Volume

This specifies the free disk space estimate for splitting this FlexClone volume.

[-type {RW|DP}] - FlexClone Type

This parameter specifies the type of FlexClone volume. A read-only FlexClone volume is created if you specify the type as `DP`; otherwise a read-write FlexClone volume is created.

[-parent-vserver <vserver name>] - FlexClone Parent Vserver

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones in the specified parent Vserver.

[-parent-volume | -b <volume name>] - FlexClone Parent Volume

This specifies the free disk space estimates for splitting the FlexClone volumes cloned off this parent volume.

[-parent-snapshot <snapshot name>] - FlexClone Parent Snapshot

This specifies the free disk space estimates for splitting the FlexClone volumes cloned off this parent snapshot.

[-state {online|restricted|offline|force-online|force-offline|mixed}] - FlexClone Volume State

This specifies the free disk space estimates for splitting the FlexClone volumes with the specified state.

[-junction-path <junction path>] - Junction Path

This specifies the free disk space estimates for splitting the FlexClone volumes mounted at this junction path.

[-junction-active {true|false}] - Junction Active

If this specified, the command displays the free disk space estimate for splitting the FlexClone volumes with the specified junction path status.

[-space-guarantee | -s {none|volume}] - Space Guarantee Style

This specifies the free disk space estimates for splitting the FlexClone volumes with the specified type of space guarantee.

[-space-guarantee-enabled {true|false}] - Space Guarantee In Effect

This specifies the free disk space estimates for splitting the FlexClone volumes with the specified state of space guarantee.

[-aggregate <aggregate name>] - FlexClone Aggregate

This specifies the free disk space estimates for splitting the FlexClone volumes residing on the specified aggregate.

[-dsid <integer>] - FlexClone Data Set ID

This specifies the free disk space estimates for splitting the FlexClone volume with the specified DSID (data set ID).

[-msid <integer>] - FlexClone Master Data Set ID

This specifies the free disk space estimates for splitting the FlexClone volumes with the specified MSID (master data set ID).

[-size {<integer>[KB|MB|GB|TB|PB]}] - FlexClone Size

This specifies the free disk space estimates for splitting FlexClone volumes with the specified size.

[-used {<integer>[KB|MB|GB|TB|PB]}] - Used Size

This specifies the free disk space estimates for splitting the FlexClone volumes with the specified amount of used disk space.

[-split-estimate {<integer>[KB|MB|GB|TB|PB]}] - Split Estimate

This specifies the free disk space estimates for splitting the FlexClone volumes which match with the specified free disk space estimate for splitting.

[-inodes-processed <integer>] - Inodes Processed

This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified number of Inodes have been processed already.

[-inodes-total <integer>] - Total Inodes

This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified total number of inodes need to be processed.

[-inode-percentage-complete <integer>] - Inode Percentage Complete

This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified percentage of Inode processing has been completed.

[-blocks-scanned <integer>] - Blocks Scanned

This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified number of blocks have been scanned.

[-blocks-updated <integer>] - Blocks Updated

This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified number of blocks have been updated.

[-comment <text>] - Comment

This specifies the free disk space estimates for splitting the FlexClone volumes that have the specified value for the comment field.

[-qos-policy-group <text>] - QoS Policy Group Name

This parameter optionally specifies which QoS policy group to apply to the FlexClone volume. The policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to the FlexClone volume, the system does not monitor and control the traffic to the volume.

[-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name

This optionally specifies which QoS adaptive policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) and Service Level agreements (SLAs) that adjust based on the volume allocated space or used space. This parameter is not supported on FlexGroups or Infinite Volumes.

[-caching-policy <text>] - Caching Policy Name

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified caching policy.

[-parent-vol-type <volAccessType>] - Parent volume type (privilege: advanced)

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones of the parent volumes with the specified type.

[-flexclone-used-percent <percent>] - FlexClone Used Percentage

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified percentage of used space.

[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified Vserver SnapMirror protection. This parameter is not supported on Infinite Volumes.

[-block-percentage-complete <integer>] - Block Percentage Complete

This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified percentage of Block processing has been completed.

[-uid <integer>] - Volume-Level UID

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified volume-level UID.

[-gid <integer>] - Volume-Level GID

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified volume-level GID.

Examples

volume clone split show

Show the status of FlexClone split operations in-progress

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume clone split show` command displays the progress information of all the active FlexClone volume splitting jobs. This command is only supported for flexible volumes. By default, this command displays the following information:

- Vserver name
- FlexClone volume name
- Number of inodes processed during clone splitting
- Total inodes to be processed during clone splitting
- Percentage of inodes processed
- Percentage of blocks processed
- Total number of blocks scanned for clone splitting
- Total number of blocks updated for clone splitting

If the `-instance` option is also specified, detailed information about all splitting jobs is displayed.

Parameters

{ **[-fields** *<fieldname>*, ...]

This specifies the fields to be displayed, for all the ongoing FlexClone splitting jobs.

| **[-instance]]**

This specifies the command to display detailed information about the ongoing FlexClone volume splitting jobs.

[-vserver *<vserver name>*] - **Vserver Name**

Selects information about the ongoing FlexClone volume splitting jobs for all FlexClone volumes on this Vserver.

[-flexclone *<volume name>*] - **FlexClone Volume**

Selects information about ongoing FlexClone volume splitting jobs for this FlexClone volume.

[-inodes-processed *<integer>*] - **Inodes processed**

Selects information about all the ongoing FlexClone splitting jobs which have the specified number of Inodes processed. If container scan is enabled, this field displays hyphen (-).

[-inodes-total *<integer>*] - **Total Inodes**

Selects information about all the ongoing FlexClone splitting jobs that have the specified number of total Inodes to be processed. If container scan is enabled, this field displays hyphen (-).

[-inode-percentage-complete *<integer>*] - **Inode Percentage complete**

Selects information about all the ongoing FlexClone splitting jobs that have the specified percentage of Inode processing completed. If container scan is enabled, this field displays hyphen (-).

[-block-percentage-complete *<integer>*] - **Block Percentage complete**

Selects information about all the ongoing FlexClone splitting jobs that have the specified percentage of Block processing completed.

[-blocks-scanned *<integer>*] - **Blocks Scanned**

Selects information about all the ongoing FlexClone splitting jobs that have the specified number of blocks scanned.

[-blocks-updated *<integer>*] - **Blocks Updated**

Selects information about all the ongoing FlexClone splitting jobs that have the specified number of blocks updated.

Examples

volume clone split start

Split a FlexClone from the parent volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume clone split start` command starts a job to separate the FlexClone volume from the underlying parent volume. Both, the parent and the FlexClone volumes will be available for the duration of the split operation. After the job starts, you can stop it using the [“volume clone split stop” on page 1376](#) command. You can also stop the job using the [“job stop” on page 167](#) command. You can monitor the current progress of the job using the [“volume clone split show” on page 1374](#) and [“job show” on page 160](#) commands. This command is only supported for flexible volumes. This command is not supported on volumes that are being protected as part of a Vserver level SnapMirror.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver that the FlexClone volume exists on.

-flexclone <volume name> - FlexClone Volume

This specifies the FlexClone volume that will be split from its parent volume.

[-foreground [true]] - Foreground Process

This specifies whether the clone splitting job will run as a foreground job. The default value of this option is `true`.

Examples

volume clone split stop

Stop an ongoing FlexClone split job

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume clone split stop` command stops the process of separating the FlexClone volume from its underlying parent volume, but does not lose any of the progress achieved while the split process was active. That is, all the clone volume blocks already separated from the parent volume remain separated. If you restart the split operation, splitting process begins from the beginning because no information about previously achieved progress is saved, but previously split blocks are not re-split. This command is only supported for flexible volumes.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver that the FlexClone volume exists on.

-flexclone <volume name> - FlexClone Volume

This specifies the FlexClone volume whose separation from the parent volume will be stopped.

Examples

volume efficiency commands

Manage volume efficiency

The `volume efficiency` commands enable you to manage efficiency on volumes. The `stat` command is not supported on Infinite Volumes. The `volume efficiency` commands are not supported on Infinite Volumes that are managed by storage services.

volume efficiency check

Scrub efficiency metadata of a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command verifies and updates the fingerprint database for the specified volume. This command is not supported on FlexGroups or Infinite Volumes that are managed by storage services.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the Vserver on which the volume is located.

{ -volume <volume name> - Volume Name

Specifies the volume on which the verify operation needs to be started.

| -path </vol/volume>} - Volume Path

Specifies the volume path on which the verify operation needs to be started.

[-delete-checkpoint | -d {true|false}] - Delete Checkpoint

Deletes existing checkpoint.

Examples

The following example runs `volume efficiency check` with delete checkpoint option turned on.

```
cluster1::> volume efficiency check -vserver vs1 -volume vol1 -delete-checkpoint true
```

volume efficiency modify

Modify the efficiency configuration of a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command is used to set or modify the schedule, policy and various other efficiency configuration options on a volume. This command is not supported on Infinite Volumes that are managed by storage services.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the volume is located.

{ -volume <volume name> - Volume Name

This specifies the volume on which efficiency options need to be modified.

| -path </vol/volume>} - Volume Path

This specifies the volume path on which efficiency options need to be modified.

{ [-schedule <text>] - Schedule

This option is used to set and modify the schedule.

schedule is [day_list][@hour_list] or [hour_list][@day_list] or - or auto or manual

The day_list specifies the days of the week that an efficiency operation should run. It is a list of the first three letters of the day (sun, mon, tue, wed, thu, fri, sat), separated by a comma. Day ranges such as mon-fri can also be used. The default day_list is sun-sat. The names are not case sensitive.

The hour_list specifies the hours of each scheduled day that an efficiency operation should run. The hour_list is from 0 to 23, separated by a comma. Hour ranges such as 8-17 are allowed. Step values can be used in conjunction with ranges (For example, 0-23/2 means every two hours in a day). The default hour_list is 0, i.e. at midnight of each scheduled day.

When efficiency is enabled on a volume for the first time, an initial schedule is assigned to the volume. This initial schedule is sun-sat@0, which means run once every day at midnight.

If "-" is specified, no schedule is set on the volume. The auto schedule string triggers an efficiency operation depending on the amount of new data written to the volume. The manual schedule string prevents SIS from automatically triggering any operations and disables change-logging. This schedule string can only be used on SnapVault destination volumes. The use of this schedule is mainly desirable when inline compression is enabled on a SnapVault destination volume and background processing is not necessary.

Note that schedule and policy are mutually exclusive options.

| [-policy <text>] - Efficiency Policy Name

This option is used to set an efficiency policy. The policy cannot be changed to the predefined *inline-only* policy when there is an active background operation on the volume.

Note that schedule and policy are mutually exclusive options.

[-compression-type {none|secondary|adaptive}] - Compression Type (privilege: advanced)

This option is used to specify the size of compression group on the volume. The default value is determined based on the platform.

[-compression {true|false}] - Compression

This option is used to enable and disable compression. The default value is false.

[-inline-compression {true|false}] - Inline Compression

This option is used to enable and disable inline compression. Inline compression can be enabled only if compression is enabled. The default value is false.

You can use the *inline-only* predefined efficiency policy to run inline compression without the need of any background efficiency operations.

[-inline-dedupe {true|false}] - Inline Dedupe

This option is used to enable and disable inline deduplication. The default value is false.

You can use the *inline-only* predefined efficiency policy to run inline deduplication without the need of any background efficiency operations.

[-data-compaction {true|false}] - Data Compaction

This option is used to enable and disable data compaction. The default value is false.

[-cross-volume-inline-dedupe {true|false}] - Cross Volume Inline Deduplication

This option is used to enable and disable cross volume inline deduplication. The default value is false.

`[-cross-volume-background-dedupe {true|false}]` - Cross Volume Background Deduplication

This option is used to enable and disable cross volume background deduplication. The default value is false.

Examples

The following examples modify efficiency options on a volume.

```
cluster1::> volume efficiency modify -vserver vs1 -volume vol1 -schedule sun-sat@12
cluster1::> volume efficiency modify -vserver vs1 -volume vol1 -policy policy1
cluster1::> volume efficiency modify -vserver vs1 -volume vol1 -compression true -inline-compression true -inline-dedupe true -data-compact
```

volume efficiency off

Disables efficiency on a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume efficiency off` command disables efficiency on a volume. This command is not supported on Infinite Volumes that are managed by storage services.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the Vserver on which the volume is located.

{ -volume <volume name> - Volume Name

Specifies the name of the volume on which efficiency needs to be disabled.

| -path </vol/volume>} - Volume Path

Specifies the volume path on which efficiency needs to be disabled.

Examples

The following examples disable efficiency on a volume:

```
cluster1::> volume efficiency off -vserver vs1 -volume vol1
cluster1::> volume efficiency off -vserver vs1 -path /vol/vol1
```

volume efficiency on

Enable efficiency on a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume efficiency on` command enables efficiency on a volume. The specified volume must be online. Efficiency operations will be started periodically according to a per volume schedule or policy. The [“volume efficiency modify” on page 1377](#) command can be used to modify schedule and the [“volume efficiency policy modify” on page 1394](#) command can be used to modify policy. You can also manually start an efficiency operation with the [“volume efficiency start” on page 1386](#) command. This command is not supported on Infinite Volumes that are managed by storage services.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the volume is located.

{ -volume <volume name> - Volume Name

This specifies the name of the volume on which efficiency needs to be enabled.

| -path </vol/volume> - Volume Path

This specifies the volume path on which efficiency needs to be enabled.

Examples

The following examples enable efficiency on a volume.

```
cluster1::> volume efficiency on -vserver vs1 -volume vol1
cluster1::> volume efficiency on -vserver vs1 -path /vol/vol1
cluster1::> volume efficiency on -vserver vs1 -volume vol1 -needs-upgrade true
cluster1::> volume efficiency on -vserver vs1 -path /vol/vol1 -needs-upgrade true
```

volume efficiency prepare-to-downgrade

Identify any incompatible volumes or Snapshot copies before downgrade

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `volume efficiency prepare-to-downgrade` command updates efficiency configurations and metadata to be compatible with releases prior to ONTAP 9. This command also disables the use of incompatible efficiency features. This command is not supported on FlexGroups.

Parameters

[-disable-feature-set <downgrade version>] - Data ONTAP Version

This parameter specifies the Data ONTAP version that introduced new volume efficiency feature set.

Examples

The following example disables the the features introduced in Data ONTAP 8.3.1

```
cluster1::*> volume efficiency prepare-to-downgrade -disable-feature-set 8.3.1
```

The following example disables the the features introduced in Data ONTAP 8.3.2.

```
cluster1::*> volume efficiency prepare-to-downgrade -disable-feature-set 8.3.2
```

The following example ignores offline volumes while disabling the the features introduced in Data ONTAP 8.3.2 .

```
cluster1::*> volume efficiency prepare-to-downgrade -disable-feature-set 8.3.2 -skip-offline-volumes true
```

The following example ignores offline volumes while disabling the the features introduced in Data ONTAP 8.3.1 .

```
cluster1::*> volume efficiency prepare-to-downgrade -disable-feature-set 8.3.1 -skip-offline-volumes true
```

volume efficiency promote

Add a volume to the preferred set of volumes for efficiency processing

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

Use the `volume efficiency promote` command to promote a volume from deprioritized state back to auto state. This command is not supported on Infinite Volumes that are managed by storage services.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the volume is located.

{ -volume <volume name> - Volume Name

This specifies the name of the volume on which auto scheduling needs to be restarted.

| -path </vol/volume> - Volume Path

This specifies the volume path on which auto scheduling needs to be restarted.

Examples

The following examples promote a volume from deprioritized state back to auto state.

```
cluster1::> volume efficiency promote -vserver vs1 -volume vol1
```

volume efficiency revert-to

Reverts volume efficiency metadata

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `volume efficiency revert-to` command reverts the format of volume efficiency metadata for the volume to the given version of Data ONTAP. This command is not supported on FlexGroups.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the volume is located.

{ -volume <volume name> - Volume Name

This specifies the name of the volume for which volume efficiency metadata needs to be reverted.

| -path </vol/volume> - Volume Path

This specifies the volume path for which volume efficiency metadata needs to be reverted.

[-version <revert version>] - Revert to Version

Specifies the version of Data ONTAP to which the volume efficiency metadata needs to be formatted.

[-delete | -d {true|false}] - Delete Existing Metafile on Revert

If set to *true*, this parameter specifies that the volume efficiency metadata be deleted instead of reverting its format. By default this parameter is set to *false*.

[-clean-up | -c {true|false}] - Delete Previously Downgraded Metafiles

If set to *true*, this parameter specifies that the volume efficiency metadata already reverted using `volume efficiency revert-to` be deleted. By default this parameter is set to *false*.

[-revert-adaptive-compression {true|false}] - Downgrade to minor version

If set to *true*, this parameter Specifies that the volume efficiency metadata needs to be reverted to minor version of Data ONTAP. By default this parameter is set to *false*.

[-check-snapshot {true|false}] - Revert ignore snapshots

If set to *false*, this parameter specifies that the volume efficiency revert will not check for Snapshot copies created by previous releases of Data ONTAP. By default this parameter is set to *true*.

Examples

The following examples reverts volume efficiency metadata on a volume named vol1 located in vserver vs1 to version 8.3.

```
cluster1::> volume efficiency revert-to -vserver vs1 -volume vol1 -version 8.3
cluster1::> volume efficiency revert-to -vserver vs1 -path /vol/vol1 -version 8.3
```

volume efficiency show

Display a list of volumes with efficiency

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume efficiency show` command displays the information about storage efficiency of volumes. The command output depends on the parameter or parameters specified. If no parameters are specified, the command displays the following information for all volumes with efficiency:

- Vserver: Vserver the volume belongs to.
- Volume: Name of the volume.
- State: Current state of efficiency on the volume (Enabled, Disabled, or Mixed).
- Status: Status of the efficiency on the volume. Following are the possible values:
 - *Active*: An efficiency operation is currently running.
 - *Idle*: There are no efficiency operations running.
 - *Initializing*: An efficiency operation is being initialized.
 - *Undoing*: Efficiency is being undone on the volume.
 - *Pending*: An efficiency operation is queued.
 - *Downgrading*: An efficiency operation necessary to downgrade the efficiency metafiles to a previous Data ONTAP release is active.
 - *Disabled*: Efficiency is disabled on the volume.

Status is not supported for Infinite Volumes and will display a value of "-"

- Progress: The progress of the current efficiency operation with information as to which stage of the efficiency process is currently in progress and how much data is processed for that stage. For example: "25 MB Scanned", "20 MB Searched", "500 KB (2%) Compressed", "40 MB (20%) Done", "30 MB Verified". Progress is not supported for Infinite Volumes and will display a value of "-"

To display detailed information, run the command with the `-l` or `-instance` parameter. The detailed view provides all information in the previous list and the following additional information (fields not supported by Infinite Volumes will display a value of "-"):

- Path: Volume Path.
- Compression: Current state of compression on the volume (Enabled or Disabled).
- Inline Compression: Current state of inline compression on the volume (Enabled or Disabled).
- Type: Type of volume (Regular or SnapVault).
- Schedule: The schedule of efficiency operation for the volume.
- Policy: Efficiency policy for the volume.
- Minimum Blocks Shared: The minimum number of adjacent blocks in a file that can be shared.
- Blocks Skipped Sharing: Blocks skipped sharing because of the minimum block share value. This parameter is not supported on Infinite Volumes.
- Last Operation State: Status of the last operation (Success or Failure). Not supported on Infinite Volumes.
- Last Successful Operation Begin: The time and date at which the last successful operation began. This parameter is not supported on Infinite Volumes.
- Last Successful Operation End: The time and date at which the last successful operation ended. This parameter is not supported on Infinite Volumes.
- Last Operation Begin: The time and date at which the last operation began. This parameter is not supported on Infinite Volumes.
- Last Operation End: The time and date at which the last operation ended. This parameter is not supported on Infinite Volumes.
- Last Operation Size: The size of the last operation. This parameter is not supported on Infinite Volumes.

- Last Operation Error: The error encountered by the last operation. This parameter is not supported on Infinite Volumes.
- Change Log Usage: The percentage of the change log that is used. This parameter is not supported on Infinite Volumes.
- Logical Data: The total logical data in the volume, and how much is reached compared to the deduplication logical data limit. This parameter is not supported on Infinite Volumes.
- Queued Job: The job that is queued. Following are the possible values:
 - -: There are no queued jobs.
 - *scan*: A job to process existing data is queued.
 - *start*: A job to process newly added data is queued.
 - *check*: A job to eliminate stale data from the fingerprint database is queued.
 - *downgrading*: An efficiency operation necessary to downgrade the efficiency metafiles to a previous Data ONTAP release is queued.
- Stale Fingerprints: The percentage of stale entries in the fingerprint database. If this is greater than 20 percent a subsequent [“volume efficiency start” on page 1386](#) operation triggers the verify operation, which might take a long time to complete. This parameter is not supported on Infinite Volumes.
- Inline Dedupe: Current state of inline deduplication on the volume (Enabled or Disabled).
- Cross Volume Inline Deduplication: Current state of cross volume inline deduplication on the volume (Enabled or Disabled).
- Cross Volume Background Deduplication: Current state of cross volume background deduplication on the volume (Enabled or Disabled).
- Inline Adaptive Data Compaction: Whether Inline Adaptive Data Compaction is enabled or disabled on the volume. When enabled, Data ONTAP combines data fragments to reduce on-disk block consumption.

You can specify additional parameters to display information that matches only those parameters. For example, to display information only about volumes with efficiency in Vserver vs1, run the command with the `-vs1` parameter.

No information is displayed for Infinite Volumes that are managed by storage services.

Parameters

{ [-fields <fieldname>, ...]

This specifies the fields that need to be displayed. The fields Vserver and volume name are the default fields.

| [-l]

This option displays detailed information about the volumes with efficiency.

| [-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

Displays information only for those volumes that match the specified Vserver.

{ [-volume <volume name>] - Volume Name

Displays information only for those volumes that match the specified volume.

| [-path </vol/volume>] - Volume Path

Displays information only for those volumes that match the specified volume path.

[-state {Disabled|Enabled|Mixed}] - State

Displays information only for those volumes that match the specified state.

[-op-status <Efficiency status>] - Status

Displays information only for those volumes that match the specified operation status. This parameter is not supported on Infinite Volumes.

[-progress <text>] - Progress

Displays information only for those volumes that match the specified progress. This parameter is not supported on Infinite Volumes.

[-type {Regular|SnapVault}] - Type

Displays information only for those volumes that match the specified type of volume.

[-schedule <text>] - Schedule

Displays information only for those volumes that match the specified schedule.

[-policy <text>] - Efficiency Policy Name

Displays information only for those volumes that match the specified policy.

[-compression-type {none|secondary|adaptive}] - Compression Type (privilege: advanced)

Displays information about the type of compression on the volume[adaptive or secondary].

[-blks-skipped-sharing <integer>] - Blocks Skipped Sharing

Displays information only for those volumes that match the specified blocks skipped sharing. This parameter is not supported on Infinite Volumes.

[-last-op-state <text>] - Last Operation State

Displays information only for those volumes that match the specified last operation state. This parameter is not supported on Infinite Volumes.

[-last-success-op-begin <Date>] - Last Success Operation Begin

Displays information only for those volumes that match the specified last successful operation begin time. This parameter is not supported on Infinite Volumes.

[-last-success-op-end <Date>] - Last Success Operation End

Displays information only for those volumes that match the specified last successful operation end time. This parameter is not supported on Infinite Volumes.

[-last-op-begin <Date>] - Last Operation Begin

Displays information only for those volumes that match the specified last operation begin time. This parameter is not supported on Infinite Volumes.

[-last-op-end <Date>] - Last Operation End

Displays information only for those volumes that match the specified last operation end time. This parameter is not supported on Infinite Volumes.

[-last-op-size {<integer>[KB|MB|GB|TB|PB]] - Last Operation Size

Displays information only for those volumes that match the specified last operation size. This parameter is not supported on Infinite Volumes.

[-last-op-error <text>] - Last Operation Error

Displays information only for those volumes that match the specified last operation error. This parameter is not supported on Infinite Volumes.

[-changelog-usage <percent_no_limit>] - Changelog Usage

Displays information only for those volumes that match the specified change log usage. This parameter is not supported on Infinite Volumes.

[-logical-data-size {<integer>[KB|MB|GB|TB|PB]] - Logical Data Size

Displays information only for those volumes that match the specified logical data size. This parameter is not supported on Infinite Volumes.

[-logical-data-limit {<integer>[KB|MB|GB|TB|PB]] - Logical Data Limit

Displays information only for those volumes that match the specified logical data limit. This parameter is not supported on Infinite Volumes.

[-logical-data-percent <percent_no_limit>] - Logical Data Percent

Displays information only for those volumes that match the specified logical data percentage. This parameter is not supported on Infinite Volumes.

[-queued-job <text>] - Queued Job

Displays information only for those volumes that match the specified number of queued jobs. This parameter is not supported on Infinite Volumes.

[-stale-fingerprint-percentage <integer>] - Stale Fingerprint Percentage

Displays information only for those volumes that match the specified stale fingerprint percentage. This parameter is not supported on Infinite Volumes.

[-compression {true|false}] - Compression

Displays information only for those volumes that match the specified compression setting.

[-inline-compression {true|false}] - Inline Compression

Displays information only for those volumes that match the specified inline compression setting.

[-is-constituent {true|false}] - Constituent Volume

Displays information only for those volumes that either are or are not constituents of an Infinite Volume, depending on the value provided.

[-inline-dedupe {true|false}] - Inline Dedupe

Displays information only for those volumes that match the specified inline deduplication setting.

[-data-compaction {true|false}] - Data Compaction

Displays information only for those volumes that match the specified data compaction setting.

[-cross-volume-inline-dedupe {true|false}] - Cross Volume Inline Deduplication

Displays information only for those volumes that match the specified cross volume inline deduplication setting.

[-cross-volume-background-dedupe {true|false}] - Cross Volume Background Deduplication

Displays information only for those volumes that match the specified cross volume background deduplication setting.

Examples

The following example displays information about all volumes with efficiency on the Vserver named vs1:

```
cluster1::> volume efficiency show -vserver vs1
Vserver    Volume      State    Status    Progress
-----
vs1        vol1        Enabled  Idle      Idle for 22:37:53
vs1        vol2        Enabled  Idle      Idle for 22:37:53
vs1        vol3        Enabled  Idle      Idle for 22:37:49
vs1        vol4        Enabled  Idle      Idle for 22:37:53
vs1        vol5        Enabled  Idle      Idle for 22:37:53
vs1        volham      Enabled  Idle      Idle for 22:37:53
vs1        volham1     Enabled  Idle      Idle for 22:37:53
7 entries were displayed.
```

The following example displays detailed information about a volume named vol1 on a Vserver named vs1:

```
cluster1::> volume efficiency show -vserver vs1 -volume vol1
Vserver Name: vs1
Volume Name: vol1
Volume Path: /vol/vol1
State: Enabled
Status: Idle
Progress: Idle for 00:00:14
Type: Regular
Schedule: sun-sat@0
Efficiency Policy Name: -
Blocks Skipped Sharing: 0
Last Operation State: Success
```

```

Last Success Operation Begin: Mon Nov 15 20:13:26 UTC 2010
Last Success Operation End: Mon Nov 15 20:13:26 UTC 2010
Last Operation Begin: Mon Nov 15 20:13:26 UTC 2010
Last Operation End: Mon Nov 15 20:13:26 UTC 2010
Last Operation Size: 0.00B
Last Operation Error: -
    Change Log Usage: 0%
    Logical Data Size: 156KB
    Logical Data Limit: 50.00TB
    Logical Data Percent: 0%
    Queued Job: -
Stale Fingerprint Percentage: 0
    Compression: false
    Inline Compression: false
    Constituent Volume: false
    Inline Dedupe: false
    Data Compaction: false
Cross Volume Inline Deduplication: false
Cross Volume Background Deduplication: false

```

volume efficiency start

Starts efficiency operation on a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

Use the `volume efficiency start` command to start an efficiency operation. The volume must be online and have efficiency enabled. If there is an efficiency operation already active on the volume, this command fails.

When the `volume efficiency start` command is issued, a checkpoint is created at the end of each stage or sub-stage, or on an hourly basis in the gathering phase. If at any point the `volume efficiency start` operation is stopped, the system can restart the efficiency operation from the execution state saved in the checkpoint. The `delete-checkpoint` parameter can be used to delete the existing checkpoint and restart a fresh efficiency operation. The checkpoint corresponding to gathering has a validity period of 24 hours. If the user knows that significant changes have not been made on the volume, then such a gatherer checkpoint whose validity has expired can be used with the help of the `use-checkpoint` parameter. There is no time restriction for checkpoints of other stages.

This command is not supported on Infinite Volumes that are managed by storage services.

When the volume is configured to use the *inline-only* efficiency policy, the system will stop monitoring changes to the data for the purpose of running background efficiency operations. The background deduplication operations will be disabled. The user can still execute compression specific efficiency operation with `-scan-old-data` and `-compression` parameters to compress the existing data on the volume.

Parameters

-vsriver <vsriver name> - Vserver Name

Specifies the Vserver on which the volume is located.

{ -volume <volume name> - Volume Name

Specifies the name of the volume.

| -path </vol/volume> - Volume Path

Specifies the complete path of the volume.

[-scan-old-data | -s [true]] - Scan Old Data

This option scans the file system and processes all existing data. It prompts for user confirmation before proceeding. Use the force option to suppress this confirmation.

{ [-use-checkpoint | -p [true]] - Use Checkpoint (if scanning old data)

Use the checkpoint when scanning existing data. Valid only if `scan-old-data` parameter is true.

[`-delete-checkpoint` | `-d` *[true]*] - Delete Checkpoint

Deletes the existing checkpoint and restarts a new `volume efficiency start` operation.

[`-qos-policy` *<sis_qos>*] - QoS Policy

Specifies the qos-policy, which indicates how the efficiency operations are throttled. This option can be configured to be `background` or `best-effort`. Default value is `best-effort`. If `background` is specified, the efficiency operations are run with minimum or no impact on the data serving client operations. If `best-effort` is specified, the efficiency operations might have some impact on the data serving client operations.

[`-compression` | `-C` *[true]*] - Start Compression (if scanning old data) (privilege: advanced)

Compresses existing data. Deduplication is not run unless the dedupe option is also specified. Valid only if `scan-old-data` parameter is true.

[`-dedupe` | `-D` *[true]*] - Start Deduplication (if scanning old data) (privilege: advanced)

Deduplicates existing data on disk. Similarly, compression is not run unless the compression option is also specified. Valid only if `scan-old-data` parameter is true.

[`-compaction` | `-P` *[true]*] - Start Compaction (if scanning old data) (privilege: advanced)

Compacts existing data on disk. Valid only if `scan-old-data` parameter is true.

[`-build-metadata` | `-m` *[true]*] - Build metadata without sharing(if scanning old data)

Builds deduplication metadata by scanning the entire file system. You will not achieve any space savings with this option. Once the metadata is built, existing data can be shared with newly written data on subsequent deduplication runs.

[`-scan-all` | `-o` *[true]*] - Scan all the data without shared block optimization(if scanning old data)

Scans the entire file system and processes the shared blocks also. You may be able to achieve additional space savings using this option. Where as, by default the option `-scan-old-data` saves some time by skipping the shared blocks.

[`-shared-blocks` | `-a` *[true]*] - Compress Shared Blocks (if scanning old data) (privilege: advanced)

Compresses the Compression Groups that have shared blocks created by deduplication or cloning data. Valid only if `scan-old-data` parameter is true.

[`-snapshot-blocks` | `-b` *[true]*] - Compress Blocks In Snapshots (if scanning old data) (privilege: advanced)

Compresses data blocks locked in a Snapshot copy. Valid only if `scan-old-data` parameter is true.

[`-queue` | `-q` *[true]*] - Operation Should Be Queued

Queues an efficiency operation. It will be queued only if an operation is already in progress. Valid only if `scan-old-data` is false.

[`-force` | `-f` *[true]*] - Force Operation

Suppresses all confirmation messages.

[`-skip-zero-replacement` | `-z` *[true]*] - Skip Zero block detection and replacement (privilege: advanced)

Skip the zero block detection and replacement during the gatherer scan. Valid only if `scan-old-data` parameter is true.

Examples

The following examples start efficiency on a volume:

```
cluster1::> volume efficiency start -volume vol1 -vserver vs1
cluster1::> volume efficiency start -scan-old-data -volume vol1 -vserver vs1
cluster1::> volume efficiency start -volume vol1 -vserver vs1 -queue -delete-checkpoint
```

volume efficiency stat

Show volume efficiency statistics

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume efficiency stat` command displays efficiency statistics. This command is not supported on Infinite Volumes. The output depends on the parameters specified with the command. If no parameters are specified, the command displays the following efficiency statistics fields for all the volumes:

- Vserver: The Vserver that the volume belongs to.
- Volume Name: Name of the volume.
- Inline Compression Attempts: Number of inline compression attempts done.
- Inline Incompressible CGs: Number of compression groups that cannot be compressed by inline compression.

To display detailed information, run the command with `-instance` parameter.

Parameters

{ [-fields <fieldname>, ...]

This specifies the fields that need to be displayed. The Vserver and volume name are the default fields.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

Displays statistics only for those volume(s) that match the specified Vserver.

{ [-volume <volume name>] - Volume Name

Displays statistics only for those volume(s) that match the specified volume name.

| [-path </vol/volume>]} - Volume Path

Displays statistics only for those volume(s) that match the specified volume path.

[-b [true]] - Display In Blocks

Displays usage size in 4k block counts.

[-num-compressed-inline <integer>] - Inline Compression Attempts

Displays statistics only for those volume(s) that match the specified number of Compression Groups attempted inline.

Examples

The following example displays default efficiency statistics for all the volumes.

```
cluster1::> volume efficiency stat
Vserver:          vs1
Volume:           vol2
Inline Compression Attempts:  0
Inline Incompressible CGs:    0

Vserver:          vs1
Volume:           vol3
Inline Compression Attempts:  0
Inline Incompressible CGs:    0
```

At the diagnostic level, the output displays the information below.

```
cluster1::*> volume efficiency stat
Vserver      Volume      Allocated      Saving      %Saved
-----
vs0          vol0          16284324 KB      4680 KB      0%
vs1          vol1          457600 KB       18684 KB      3%
vs1          vol2          3458716 KB       0 KB         0%
```

vs1	vol3	965296 KB	308 KB	0%
vs1	vol4	796212 KB	60 KB	0%
vs1	vol5	3762452 KB	10236 KB	0%
vs1	volham	3888 KB	0 KB	0%
vs2	vol2	156 KB	0 KB	0%

8 entries were displayed.

The following example display the node statistics:

```
cluster1::> volume efficiency stat -g
Node Name:          Cluster-01
Max Efficiency Ops:  8
Max Share Blocks:    3060
Pending Efficiency Ops: 0
Running Efficiency Ops: 0
Total Configured:    9
Succeeded Ops:       1
Started Ops:         1
Failed Ops:          4
Deferred Ops:        0
Stopped Ops:         0

```

volume efficiency stop

Stop efficiency operation on a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

Use the `volume efficiency stop` command to stop an efficiency operation. This command is not supported on Infinite Volumes that are managed by storage services.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the volume is located.

{ -volume <volume name> - Volume Name

This specifies the name of the volume on which efficiency operation needs to be stopped.

| -path </vol/volume>} - Volume Path

This specifies the volume path on which efficiency operation needs to be stopped.

[-all | -a [true]] - Stop All Operations

This specifies both active and queued efficiency operations to be aborted.

Examples

The following examples stop efficiency on a volume.

```

cluster1::> volume efficiency stop -vserver vs1 -volume vol1
cluster1::> volume efficiency stop -vserver vs1 -volume vol1 -all

```

volume efficiency undo

Undo efficiency on a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The command `volume efficiency undo` removes volume efficiency on a volume by undoing compression, undoing compaction and removing all the block sharing relationships, and cleaning up any volume efficiency specific data structures. Any efficiency operations on the volume must be disabled before issuing this command. The volume efficiency configuration is deleted when the undo process completes. The command is used to revert a volume to an earlier version of Data ONTAP where some of the efficiency features are not supported. During this revert not all efficiencies needs to be undone but only those gained by that particular feature (for example, compaction), which is not supported in the earlier version.

This command is not supported on Infinite Volumes that are managed by storage services.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the volume is located.

{ -volume <volume name> - Volume Name

This specifies the volume name.

| -path </vol/volume> - Volume Path

This specifies the volume path.

[-compression | -C [true]] - Decompress Data in the Volume

Undo the effects of compression. This requires efficiency to be disabled (by performing [“volume efficiency off” on page 1379](#)).

[-dedupe | -D [true]] - Undo Block Sharing in the Volume

Undo the effects of deduplication. This requires efficiency to be disabled (by performing [“volume efficiency off” on page 1379](#)).

[-inode | -i <integer>] - Inode Number to Undo Sharing

Remove the block sharings from a specified inode. This parameter is not supported on Infinite Volumes.

[-undo-type | -t {all|wrong}] - Selective Undo

This specifies to remove either all or only invalid block sharing. When *all* is used, all block sharings are removed. When *wrong* is used, only invalid sharings present in the volume are removed. When used along with *log* option, it logs information about all or wrong block sharings without sharing removal.

[-log | -d [true]] - Only Log Incorrect Savings

If specified, information about invalid block sharing relationships will only be logged. Invalid sharings will not be removed. This parameter is only valid when the parameter *-undo-type* is specified as *wrong*.

[-data-compaction | -P [true]] - Undo Data Compaction in the Volume

Undo the effects of data compaction.

[-cross-volume-dedupe | -A [true]] - Undo Cross Volume Deduplication

Undo the effects of cross volume deduplication.

Examples

The following are examples of how to use efficiency undo.

To undo deduplication savings, but not compaction or compression savings in a volume name vol1 on a Vserver named vs1:

```
cluster1::> volume efficiency undo -vserver vs1 -volume vol1
```

To rewrite compressed blocks and undo compression savings in a volume name vol1 on a Vserver named vs1:

```
cluster1::> volume efficiency undo -vserver vs1 -volume vol1 -compression
```

To rewrite compressed and deduped blocks without any efficiency in a volume name vol1 on a Vserver named vs1:

```
cluster1::> volume efficiency undo -vserver vs1 -volume vol1 -dedup -compression
```

To rewrite compacted blocks in a volume name vol1 on an SVM named vs1:

```
cluster1::> volume efficiency undo -vserver vs1 -volume vol1 -data-compaction
```

volume efficiency policy commands

Manage efficiency policies

The `volume efficiency policy` commands enable you to manage efficiency policies.

volume efficiency policy create

Create an efficiency policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume efficiency policy create` creates an efficiency policy.

Parameters

-vserver <vserver name> - Vserver

Specifies the Vserver on which the volume is located.

-policy <text> - Efficiency Policy Name

This specifies the policy name.

[-type <Efficiency policy type>] - Policy Type

This specifies the policy type. The policy type defines when the volume using this policy will start processing a changelog. There are two possible values:

- *threshold* means changelog processing occurs when the changelog reaches a certain percentage.
- *scheduled* means changelog processing will be triggered by time.

The default value is *scheduled*.

[-schedule <text>] - Job Schedule Name

This specifies the job schedule. Use [“job schedule” on page 178](#) commands to manage job schedules. Only cron job schedules are supported.

[-duration <text>] - Duration

This specifies the duration that an efficiency operation can run (in hours). The possible values are "-" or a number between 1 and 999 inclusive. Default value is "-", which means no duration.

[-start-threshold-percent <percent>] - Threshold Percentage

The percentage at which the changelog will be processed. The percentage is checked on an hourly basis. The default value is 20. Valid only if `-type` parameter is set as *threshold*.

[-qos-policy <Efficiency QoS policy>] - QoS Policy

This specifies how the efficiency operations are throttled. This option can be configured to be *background* or *best-effort*. Default value is *best-effort*. If *background* is specified, the efficiency operations are run with minimum or no impact on the data serving client operations. If *best-effort* is specified, the efficiency operations might have some impact on the data serving client operations.

[-enabled {true|false}] - Enabled

This specifies whether the policy is enabled or not. The policy is enabled by default.

[-comment <text>] - Comment

User specified comment.

Examples

The following example creates an efficiency policy.

```
cluster1::> volume efficiency policy create -vserver vs1 -policy policy1 -schedule daily -duration 100
```

volume efficiency policy delete

Delete an efficiency policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume efficiency policy delete` command deletes an efficiency policy. An efficiency policy can be deleted only when it is not associated with any volume. The pre-defined policies *default* and *inline-only* cannot be deleted.

Parameters

-vserver <vserver name> - Vserver

This specifies the Vserver on which the volume is located.

-policy <text> - Efficiency Policy Name

This specifies the policy name.

Examples

The following example deletes an efficiency policy:

```
cluster1::> volume efficiency policy delete -vserver vs1 -policy policy1
```

volume efficiency policy modify

Modify an efficiency policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume efficiency policy modify` command can be used to modify the policy attributes.

The attributes of the *inline-only* predefined policy cannot be modified.

Parameters

-vserver <vserver name> - Vserver

This specifies the Vserver on which the volume is located.

-policy <text> - Efficiency Policy Name

This specifies the policy name.

[-type <Efficiency policy type>] - Policy Type

This specifies the policy type. The policy type defines when the volume using this policy will start processing a changelog. There are two possible values:

- *threshold* means changelog processing occurs when the changelog reaches a certain percentage.
- *scheduled* means changelog processing will be triggered by time.

The default value is *scheduled*.

[-schedule <text>] - Job Schedule Name

This specifies the job schedule. Use [“job schedule show” on page 178](#) to show all the jobs.

[-duration <text>] - Duration

This specifies the duration that an efficiency operation can run in hours. The possible value is between 1 and 999 inclusive.

[-start-threshold-percent <percent>] - Threshold Percentage

The percentage at which the changelog will be processed. The percentage is checked on an hourly basis. The default value is 20. Valid only if -type parameter is set as *threshold*.

[-qos-policy <Efficiency QoS policy>] - QoS Policy

This specifies how the efficiency operations are throttled. This option can be configured to be `background` or `best-effort`. Default value is `best-effort`. If `background` is specified, the efficiency operations are run with minimum or no impact on the data serving client operations. If `best-effort` is specified, the efficiency operations might have some impact on the data serving client operations.

[-enabled {true|false}] - Enabled

This specifies whether the policy is enabled or not. Default value is `true`.

[-comment <text>] - Comment

User specified comment.

Examples

The following example modifies efficiency policy.

```
cluster1::> volume efficiency policy modify -policy policy1 -schedule hourly
```

volume efficiency policy show

Show efficiency policies

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume efficiency policy show` command displays information about efficiency policies. By default, the command displays the following information about all policies:

- Vserver: Name of the Vserver that the policy belongs to.
- Policy Name: Efficiency policy name.
- Job Schedule: Job schedule name.
- Duration (Hours): The duration in hours that the efficiency operation can run.
- Enable: Whether the policy is enabled or not.
- Comment: User specified comment.

You can specify additional parameters to select the displayed information. For example, to display efficiency policies only with duration 5 hours, run the command with the `-duration 5` parameter.

The pre-defined policies *default* and *inline-only* are available when all the nodes in the cluster are running Data ONTAP version 8.3 or later.

The *inline-only* pre-defined policy must be used when the user wants to use the inline compression feature without any regularly scheduled or manually started background storage efficiency operations. When a volume is configured to use the *inline-only* efficiency policy, the system will stop monitoring changes to the data for running the background efficiency operations on the volume. Volumes cannot be configured with the *inline-only* policy if there is a currently active background efficiency operation.

Parameters

{ [-fields <fieldname>, ...]

Selects the fields to be displayed. Vserver and policy are the default fields (see example).

| [-instance]]

If this parameter is specified, the command displays information about all entries.

[-vserver <vserver name>] - Vserver

Selects information about the policies that match the specified Vserver.

[-policy <text>] - Efficiency Policy Name

Selects information about the policies that match the specified policy name.

[-type <Efficiency policy type>] - Policy Type

Selects information about the policies that match the specified policy type. There are two possible values - *threshold* and *scheduled*.

[-schedule <text>] - Job Schedule Name

Selects information about the policies that match the specified schedule.

[-duration <text>] - Duration

Selects information about the policies that match the specified duration hours.

[-start-threshold-percent <percent>] - Threshold Percentage

Selects information about the policies that match the specified start-threshold-percent. Valid only if -type parameter is set as *threshold*.

[-qos-policy <Efficiency QoS policy>] - QoS Policy

Selects information about the policies that match the specified throttling method. The values can be background or best-effort.

[-enabled {true|false}] - Enabled

Selects information about the policies that have the specified enabled setting.

[-comment <text>] - Comment

Selects information about the policies that match the specified comment.

[-policy-owner {cluster-admin|vserver-admin}] - Owner of the Policy

Selects information about the policies that match the specified owner. The values can be cluster-admin or vserver-admin.

Examples

The following example shows all the efficiency policies with the matching Vserver vs1.

```
cluster1::> volume efficiency policy show -vserver vs1
  Policy      Job      Duration
Vserver Name  Schedule (Hours) QoS Policy Enabled Comment
-----
vs1    default  daily    -        best_effort true  Default policy
vs1    inline-only -        -        -        -    Inline-Only
                        policy
vs1    policy1   daily    -        best_effort true  user-defined
3 entries were displayed.
```

The following example shows all the policies with the following fields - Vserver (default), policy (default) and duration.

```
cluster1::> volume efficiency policy show -fields duration
vserver policy      duration
-----
vs1    default      -
vs1    inline-only  -
vs1    policy1      -
3 entries were displayed.
```

volume encryption commands

The encryption directory

volume encryption conversion commands

Manage volume encryption conversion operation

volume encryption conversion pause

Pause a running volume encryption conversion operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume encryption conversion pause` command pauses the running encryption conversion operation on a volume.

Parameters

-vserver <vserver name> - Vserver Name

This parameter specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume being encrypted.

[-ignore-warning {true|false}] - Ignore Warning for Conversion Pause

If this parameter is set, the command ignores the confirmation message.

Examples

volume encryption conversion resume

Resume a paused volume encryption conversion operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume encryption conversion resume` command resumes the paused encryption conversion operation on a volume.

Parameters

-vserver <vserver name> - Vserver Name

This parameter specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume being encrypted.

Examples

volume encryption conversion show

Show status of a volume encryption conversion

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume encryption conversion show` command displays information about volume encryption conversion in the cluster. By default, with no parameters, it only shows volume encryption operations that have failed or are currently running. The command display output depends on the parameters passed. If `-vserver` and `-volume` are specified, the following information is displayed:

- Vserver Name: The Vserver on which the volume is located.
- Volume Name: The volume that is part of a completed or running volume move operation.
- Start Time: The date and time when the volume encryption operation was started.

- Status of Operation: The status of the operation.
- Percentage Completed: The amount of work to encrypt the volume completed thus far in terms of percentage.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

This parameter specifies the Vserver on which the volume is located.

[-volume <volume name>] - Volume Name

This parameter specifies the name of the volume being encrypted.

[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time

If this parameter is specified, the command displays encryption operations that match the specified date and time in the cluster time zone when the volume move operation started.

[-status <text>] - Status

If this parameter is specified, the command displays encryption operations that match the specified status of the encryption operation.

Examples

The following example shows a sample output for this command:

```
cluster1::> volume encryption conversion show
```

Vserver	Volume	Start Time	Status
vs1	p2	9/18/2017 17:44:36	Phase 2 of 2 is in progress.

volume encryption conversion start

Start a volume encryption conversion operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume encryption conversion start` command converts a non-encrypted volume to encrypted volume.

Parameters

-vserver <vserver name> - Vserver Name

This parameter specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume being encrypted.

[-ignore-warning {true|false}] - Ignore Warning for Conversion Start

If this parameter is set, the command ignores the confirmation message.

Examples

volume encryption rekey commands

Manage volume encryption operation

volume encryption rekey pause

Pause a running volume encryption rekey operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume encryption rekey pause` command pauses the running encryption rekey operation on a volume.

Parameters

-vserver <vserver name> - Vserver Name

This parameter specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume being encrypted.

[-ignore-warning {true|false}] - Ignore Warning for Rekey Pause

If this parameter is set, the command ignores the confirmation message.

Examples

volume encryption rekey resume

Resume a paused volume encryption rekey operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume encryption rekey resume` command resumes the paused encryption rekey operation on a volume.

Parameters

-vserver <vserver name> - Vserver Name

This parameter specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume being encrypted.

Examples

volume encryption rekey show

Show status of a volume encryption rekey

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume encryption rekey show` command displays information about volume encryption rekey in the cluster. By default, with no parameters, it only shows volume encryption rekey operations that have failed or

are currently running. The command display output depends on the parameters passed. If `-vserver` and `-volume` are specified, the following information is displayed:

- **Vserver Name:** The Vserver on which the volume is located.
- **Volume Name:** The volume that is part of a completed or running volume move operation.
- **Start Time:** The date and time when the volume encryption operation was started.
- **Status of Operation:** The status of the operation.
- **Percentage Completed:** The amount of work to encrypt the volume completed thus far in terms of percentage.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

This parameter specifies the Vserver on which the volume is located.

[-volume <volume name>] - Volume Name

This parameter specifies the name of the volume being encrypted.

[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time

If this parameter is specified, the command displays encryption operations that match the specified date and time in the cluster time zone when the volume move operation started.

[-status <text>] - Status

If this parameter is specified, the command displays encryption operations that match the specified status of the encryption operation.

Examples

The following example shows a sample output for this command:

```
cluster1::> volume encryption rekey show
```

Vserver	Volume	Start Time	Status
vs1	vol2	9/18/2017 17:51:41	Phase 2 of 2 is in progress.

volume encryption rekey start

Start a volume encryption rekey operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume encryption rekey start` command changes the encryption key of a volume.

Parameters

-vserver <vserver name> - Vserver Name

This parameter specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume being rekeyed.

[-ignore-warning {true|false}] - Ignore Warning for Rekey Start

If this parameter is set, the command ignores the confirmation message.

Examples

volume encryption secure-purge commands

Manage volume encryption secure-purge operations

volume encryption secure-purge abort

Abort secure deletion of trash in existing volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `volume encryption secure-purge abort` command aborts the secure purge operation on a volume.

Parameters

-vserver <*vserver name*> - **Vserver**

This parameter specifies the Vserver on which the volume is located.

-volume <*volume name*> - **Volume**

This parameter specifies the name of the volume being encrypted.

Examples

volume encryption secure-purge show

Show status of secure-purge operation on a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `volume encryption secure-purge show` command displays information about volume encryption securepurge operation in the cluster.

Parameters

{ **[-fields** <*fieldname*>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <*vserver name*>] - **Vserver**

This parameter specifies the Vserver on which the volume is located.

[-volume <*volume name*>] - **Volume**

This parameter specifies the name of the volume being secure purged.

[-status {*invalid|initializing|snapshots-deleting|snapshots-deleted|zombies-draining|zombies-drained|batched-free-log-draining|batched-free-log-drained|finishing-trash-purge|finished-trash-purge|reencrypting|aborting|aborted|success|failure*}] - **Status**

This parameter displays the status of the secure purge operation.

Examples

The following example shows a sample output for this command:

```
cluster1::> volume encryption secure-purge show
Vserver      Volume      Secure Purge Phase
-----
```

volume encryption secure-purge start

Start secure deletion of trash in existing volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `volume encryption secure-purge start` command performs secure purge of encrypted volume.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which the volume is located.

-volume <volume name> - Volume

This parameter specifies the name of the volume being encrypted.

Examples

volume file commands

File related commands

volume file compact-data

Apply Adaptive Data Compaction to a Snapshot copy of a file

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `volume file compact-data` command applies the Adaptive Data Compaction feature to the Snapshot copy of a file such that partially filled blocks from that file will merge and consume less storage space.

Parameters

-node <nodename> - Node

This parameter indicates the node name that the AWA instance runs on.

-vserver <vserver name> - Vserver Name

This specifies the Vserver in which the target file is located.

-file </vol/<volume name>/<file path>> - File Path

This specifies the complete file path. The Snapshot copy name can be specified as part of the path or by specifying the `-snapshot` parameter.

[-volume <volume name>] - VolumeName

This specifies the volume in which the targeted file is located.

[-snapshot <snapshot name>] - Snapshot Copy Name

This specifies the Snapshot copy name in which the file will be compacted.

Examples

The following command applies the Adaptive Data Compaction feature to the Snapshot copy *snap1* of the file */file1* in volume *vol1*:

```
cluster1::> volume file compact-data -vserver vs1 -volume vol1 -file /vol/vol1/file1 -snapshot snap1
```

volume file modify

Manage the association of a QoS policy group with a file

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command adds and removes files from QoS policy groups. QoS policy groups define measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. A QoS policy group associated with this file can be created, modified, and deleted. You cannot associate a file to a QoS policy group if a LUN was created from the file.

This command is not supported on FlexGroups or Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver Managing Volume

This specifies the Vserver on which the volume (containing the file) resides.

-volume <volume name> - Volume Name

This specifies the name of the volume. The name must be unique within the hosting Vserver.

-file <text> - File Path

This specifies the actual path of the file with respect to the volume.

{ [-qos-policy-group <text>] - QoS Policy Group Name

This option associates the file with a QoS policy group. This policy group manages storage system resources to deliver your desired level of service. If you do not assign a policy to a file, the system will not monitor and control the traffic to it. To remove this file from a QoS policy group, enter the reserved keyword "none".

| [-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name

This optional parameter specifies which QoS adaptive policy group to apply to the file. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the file's allocated space or used space. To remove this file from an adaptive policy group, enter the reserved keyword "none".

[-caching-policy <text>] - Caching Policy Name

This optionally specifies the caching policy to apply to the file. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this file, the system uses the caching policy that is assigned to the containing volume. If a caching policy is not assigned to the containing volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

Examples

```
cluster1::> vol file modify -vserver vs0 -volume vs0_vol56 -file 1.txt -qos-policy-group fast -cache all-read
```

volume file privileged-delete

Perform a privileged-delete operation on unexpired WORM files on a SnapLock enterprise volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume file privileged-delete` command is used to perform a privileged-delete operation on unexpired WORM files on a SnapLock enterprise volume. The only built-in role that has access to the command is "*vsadmin-snaplock*".

Parameters

-vserver <vserver name> - Vserver

Specifies the Vserver which hosts the SnapLock enterprise volume.

-file </vol/<volume name>/<file path>> - File Path

Specifies the absolute path of the file to be deleted. The value begins with `/vol/<volumename>`.

Examples

The following example deletes the unexpired WORM file `"/vol/vol1/wormfile"`. The file `wormfile` is stored in volume `vol1` under Vserver `vserver1`.

```
vserver1::> volume file privileged-delete -file /vol/vol1/wormfile
[Job 76] Job succeeded: Privileged-delete of File "vs1:/vol/sle_vol1/wormfile" Completed.
```

volume file reservation

Get/Set the space reservation info for the named file.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume file reservation` command can be used to query the space reservation settings for the named file, or to modify those settings. This command is not supported on Infinite Volumes. With no further modifiers, the command will report the current setting of the space reservation flag for a file. This tells whether or not space is reserved to fill holes in the file and to overwrite existing portions of the file that are also stored in a snapshot. For symlinks, the link is followed and the command operates on the link target.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the Vserver on which the volume is located. If only one data Vserver exists, you do not need to specify this parameter.

-path </vol/<volume name>/<file path>> - File Name

Specifies the complete file path for which we want to get/set the space reservation settings.

[-is-enabled <text>] - enable | disable

Specifying enable or disable will turn the reservation setting on or off accordingly for the file.

Examples

The following example enables the file reservation setting for the file named file1. The file file1 is stored in volume testvol on Vserver vs0.

```
node::> file reservation -vserver vs0 /vol/testvol/file1 enable
space reservations for file /vol/testvol/file1: on.
```

volume file show-disk-usage

Show disk usage of file

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command requires a path to a file in a volume and displays the following information:

- Vserver name
- Total bytes used by the file in kilobytes
- Full Path to the file

If not logged in as Vserver administrator, the command also requires a Vserver name. This command is not supported on an Infinite Volume.

Note: The "-instance" option provides the same result as the default as there are no extra fields to display.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-h]

If this parameter is specified, the command displays total bytes used by the file in human readable form.

| [-k]

If this parameter is specified, the command displays total bytes used by the file in kilobytes.

| [-m]

If this parameter is specified, the command displays total bytes used by the file in megabytes.

| [-u]

If this parameter is specified, the command displays the unique bytes used by the file (bytes that are not shared with any other file in the volume due to deduplication or FlexClone files) in kilobytes.

| [-uh]

If this parameter is specified, the command displays the unique bytes used by the file in human readable form.

| [-uk]

If this parameter is specified, the command displays the unique bytes used by the file in kilobytes.

| [-um]

If this parameter is specified, the command displays the unique bytes used by the file in megabytes.

| [-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

-vserver <vserver name> - Vserver

This parameter is used to specify the Vserver that contains the file for which the command displays the total bytes used. It is required if not logged in as Vserver administrator.

-path </vol/<volume name>/<file path>> - Full Path

This required parameter is used to specify the path of the file for which the command displays the total bytes used.

[*-range* | *-r* <<start offset>:<end offset>>] - Block Range

If this parameter is specified, the command displays the total bytes used by the file in the specified block range.

Examples

The following example displays the disk-usage of the file *file1.txt* in volume */vol/root_vs0*.

```
cluster1::> volume file show-disk-usage -vserver vs0 -path /vol/root_vs0/file1.txt
```

Vserver	Total	Path
vs0	1408KB	/vol/root_vs0/file1.txt

```
cluster1::> volume file show-disk-usage -m -vserver vs0 -path /vol/root_vs0/file1.txt
```

Vserver	Total	Path
vs0	1MB	/vol/root_vs0/file1.txt

```
vs0::> volume file show-disk-usage -um -path /vol/root_vs0/file1.txt
```

Vserver	Total	Unique	Path
vs0	1MB	1MB	/vol/root_vs0/file1.txt

volume file show-filehandle

Show the file handle of a file

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command requires a path to a file in a volume and displays the file handle information described below:

- Vserver name
- Path to the file
- File handle flags
- Snapshot ID of the file (snapid)
- File ID
- File handle generation number
- File system ID (fsid)
- Master data set ID (msid)
- Data set ID (dsid)

If not logged in as a Vserver administrator, the command also requires a Vserver name.

Parameters

{ [*-fields* <fieldname>, ...]

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

| [*-instance*]}

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[*-vserver* <vserver name>] - Vserver Managing Volume

This specifies the Vserver where the file resides.

[*-path* <text>] - Path to File

This specifies the path to the file.

Examples

The following example displays the file handle information of a file named *file1.txt* in the volume */vol/vol1*.

```
cluster1::> volume file show-filehandle -vserver vs0 -path /vol/vol1/file1.txt
```

Vserver		Path				
vs0		/vol/vol1/file1.txt				
flags	snapid	fileid	generation	fsid	msid	dsid
0x0	0	0x60	0x206b6	0x402	0x80000402	0x402

volume file show-inode

Display file paths for a given inode

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays information about all the files having a given inode in a volume of a Vserver. If the *-snapshot-id* or *-snapshot-name* parameter is specified, the command displays file information from the Snapshot copy; otherwise, it displays the information from the active file system. The *-vserver*, *-volume* and *-inode-number* are mandatory parameters.

If no optional parameter is specified, the command displays the following fields for all the files having the given inode:

- Vserver Name
- Volume Name
- Inode Number
- File Path

The volume file show-inode command is only supported on flexible volumes and FlexGroup constituents.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the *-fields* parameter, the command output also includes the specified field or fields.

| **[-snapshot]**

If this parameter is specified, the command displays the following information:

- Vserver Name
- Volume Name
- Inode Number
- Snapshot Name
- Snapshot ID
- File Path

| **[-instance]**

If this parameter is specified, the command displays detailed information about the files matching the specified inode number. The following information is displayed:

- Vserver Name
- Volume Name

- Inode Number
- File Path
- Snapshot Name
- Snapshot ID
- File Name
- Parent Inode Number
- Parent Directory Cookie

-vserver <vserver name> - Vserver Name

This specifies the Vserver in which the volume or Snapshot copy is located.

-volume <volume name> - Volume Name

This specifies the volume in which the inode number is located.

-inode-number <integer> - Inode Number

This specifies the inode number whose information has to be retrieved.

{ [-snapshot-name <snapshot name>] - Snapshot Name

If this parameter or -snapshot-id is specified, information about the files is retrieved from the Snapshot copy instead of the active file system.

[-snapshot-id <integer>] - Physical Snapshot ID

If this parameter or -snapshot-name is specified, information about the files is retrieved from the Snapshot copy instead of the active file system.

[-file-path <text>] - File Path

If this parameter is specified, the command displays information only about the files that match the specified file path.

[-file-name <text>] - File Name

If this parameter is specified, the command displays information only about the files that match the specified file name.

[-parent-inode-number <integer>] - Parent Inode Number

The inode number of the parent directory of the file associated with the inode. If this parameter is specified, the command displays information only about the files that match the specified parent inode number.

[-parent-dir-cookie <integer>] - Parent Directory Cookie

The index of the directory entry of the file in its parent directory tree. If this parameter is specified, the command displays information only about the files that match the specified parent directory cookie.

Examples

The following example displays information about all the files having the inode number 96 in the active file system of a volume named vol1 on a Vserver named vs1:

```
cluster1::> volume file show-inode -vserver vs1 -volume vol1 -inode-number 96
```

Vserver	Volume	Inode Number	File Path
vs1	vol1	96	/vol/vol1/file1
vs1	vol1	96	/vol/vol1/file2
vs1	vol1	96	/vol/vol1/A/file2

3 entries were displayed.

The following example displays information about all the files with inode number 96 in a Snapshot copy named mysnap. The Snapshot copy is present in a volume named vol1 on a Vserver named vs1:

```
cluster1::> volume file show-inode -vserver vs1 -volume vol1 -inode-number 96 -snapshot-name mysnap -snapshot
```

Vserver	Volume	Inode Number	Snapshot Name	Snapshot ID	File Path
vs1	vol1	96	mynsnap	131	/vol/vol1/.snapshot/mynsnap/file1
vs1	vol1	96	mynsnap	131	/vol/vol1/.snapshot/mynsnap/file2

2 entries were displayed.

The following example displays detailed information about all the files with inode number 96 in a Snapshot copy named mynsnap. The Snapshot copy is present in a volume named vol1 on a Vserver named vs1:

```
cluster1::> volume file show-inode -vserver vs1 -volume vol1 -inode-number 96 -snapshot-name mynsnap -instance
```

```

    Vserver Name: vs1
    Volume Name: vol1
    Inode number: 96
    File Path: /vol/vol1/.snapshot/mynsnap/file1
    Snapshot Name: mynsnap
    Physical Snapshot ID: 131
    File Name: file1
    Parent Inode Number: 64
    Parent Directory Cookie: 2

    Vserver Name: vs1
    Volume Name: vol1
    Inode number: 96
    File Path: /vol/vol1/.snapshot/mynsnap/file2
    Snapshot Name: mynsnap
    Physical Snapshot ID: 131
    File Name: file2
    Parent Inode Number: 64
    Parent Directory Cookie: 3
    2 entries were displayed.
```

volume file clone commands

Manage File Clones

volume file clone autodelete

Enable/Disable autodelete

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume file clone autodelete` command enables or disables the automatic deletion of file, LUN or NVMe namespace clones. Newly created file, LUN and NVMe namespace clones are disabled for automatic deletion by default. This command is not supported on Infinite volumes.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the volume resides. If only one data Vserver exists, you do not need to specify this parameter.

[-volume <volume name>] - Volume Name

This specifies the name of the volume in which the file, LUN or NVMe namespace is present.

-clone-path <text> - Clone Path

This specifies the path where clone resides. If you use the volume parameter, then specify the relative path to the file, LUN or NVMe namespace clone. Otherwise, specify the absolute path.

-enable {true|false} - Enable or Disable Autodelete

This parameter enables or disables the autodelete feature for the file, LUN or NVMe namespace clones in a specified volume if the clones are already added for automatic deletion. If you set the parameter to `true`, the specified file, LUN or NVMe namespace clones get automatically deleted in the 'try' or 'disrupt' mode. If the value is `false`, the clones get automatically deleted only in the 'destroy' mode.

`[-force [true]] - Force Enable or Disable Autodelete`

If `-enable` is `true` then this parameter forces automatic deletion of a specified file, LUN or NVMe namespace, or a file, LUN or NVMe namespace clone. If `-enable` is `false` then specifying this parameter disables autodeletion on a file, LUN or NVMe namespace - or a file, LUN or NVMe namespace clone - even if `-commitment destroy` is specified.

Examples

The following command enables for automatic deletion a LUN Clone named `lun_clone` contained in a volume named `volume1`. This volume is present on a Vserver named `vs1`.

```
cluster1::> volume file clone autodelete /vol/volume1/lun_clone -enable true -vserver vs1
```

The following command specifies the relative clone path when the volume parameter is specified in the command.

```
cluster1::> volume file clone autodelete lun_clone -enable true  
-vserver vs1 -volume volume1
```

volume file clone create

Create file or LUN full or sub file clone

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume file clone create` command creates a clone of a file, a LUN or an NVMe namespace. This command is not supported on Infinite Volumes. You can optionally specify the following parameters for the clone file creation process:

- Vserver in which the volume resides
- Name of the parent snapshot
- The range of blocks to be cloned
- The option to avoid space reservations for the new file or LUN clone
- The option to assign a QoS policy group to the new file or LUN clone
- The option to assign a caching policy to the new file or LUN clone
- The option to mark the new file, LUN or NVMe namespace clone created for auto deletion
- The option to overwrite an existing file, LUN or NVMe namespace clone

File, LUN or NVMe namespace clones create a duplicate copy of another file, LUN or NVMe namespace, but don't require copying the data itself. This allows the clone operation to occur in constant time, taking the same amount of time to complete no matter the size of the file being cloned. This also means that clones require only a small amount of additional storage space because the clone shares the data with the source file, LUN or NVMe namespace.

Parameters

`-vserver <vserver name>` - Vserver Name

This specifies the Vserver in which the parent volume resides. If only one data Vserver exists, you do not need to specify this parameter.

`[-volume <volume name>]` - Volume

This specifies the name of volume in which a file, LUN or NVMe namespace is going to be cloned.

-source-path <text> - Source Path

This specifies the path to the file, LUN or NVMe namespace to be cloned relative to the specified volume.

-destination-path <text> - Destination Path

This specifies the path for the newly-created cloned file, LUN or NVMe namespace relative to the specified volume. If the file, LUN or NVMe namespace clone to be created is a whole file, LUN or NVMe namespace, the destination file, LUN or NVMe namespace must not exist. If the `range` parameter is specified, the destination file or LUN must exist. The `range` parameter is not supported on NVMe namespace clones. If the `snapshot-name` parameter is specified, this option is mandatory.

[-snapshot-name | -s <snapshot name>] - Source Snapshot

The name of the Snapshot copy to use as the source for the clone operation. If this value is not specified, the active filesystem will be used instead.

{ [-range | -r <<source start block>:<destination start block>:<block length>>, ...] - Block Range

This specifies the block range to be cloned. If the range is not specified, the entire file, LUN or NVMe namespace is cloned. The block range should be specified in the format `s:d:n` where `s` is the source start block number, `d` is the destination start block number, and `n` is the length in blocks to be cloned. The range of `n` should be from 1 to 32768 or 1 to 16777216 in case of clone from Active File System or Snapshot copy respectively. If this parameter is used in the path provided by the `destination-path`, the parameter must refer to a file or LUN which already exists. If either the source or destination are a LUN then the block size is measured in 512-byte LBA blocks. If neither the source nor destination are a LUN then the block size will be 4KB. If 512-byte sectors are used the source and destination offsets must have the same offset within 4KB blocks. The `range` parameter is unsupported for NVMe namespace clones. This option is most likely to be used by external automated systems in managing virtual disk configurations and not by human administrators.

| [-no-reserve | -o [true]] - Do not reserve clone

If this option is used, the clone file or LUN will not be guaranteed space in the underlying aggregate. While this out-of-space condition persists, writes to the clone file or LUN would fail. This option may be useful if few writes to the clone are expected to be needed, or to allow a file or LUN clone to be created under space-constrained conditions for recovery purposes. If this option is not specified the clone will inherit the space reservation properties from the source.

[-ignore-streams | -i [true]] - Ignore streams

This parameter specifies whether streams should be ignored during cloning of files or LUNs. If you set this parameter to false, the streams are ignored; otherwise, they are included in the clones. The default value is false.

[-ignore-locks | -k [true]] - Ignore locks

This parameter specifies whether byte-range locks and shared-mode locks on files, LUNs or NVMe namespaces should be ignored during cloning. If you set this parameter to true, the locks are ignored; otherwise, clone operation fails if locks are present on files, LUNs or NVMe namespaces. The default value is false.

[-overwrite-destination | -d [true]] - Overwrite Destination

Specify this parameter to overwrite the destination file, if it exists. The default is to fail the command if the destination exists.

{ [-qos-policy-group <text>] - QoS Policy Group Name

This optionally specifies which QoS policy group to apply to the file or LUN. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a file or LUN, the system will not monitor and control the traffic to it. You cannot associate a file to a QoS policy group if a LUN was created from the file.

| [-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name

This optionally specifies which QoS adaptive policy group to apply to the file or LUN. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the file or LUN's allocated space or used space.

[-caching-policy <text>] - Caching Policy Name

This optionally specifies the caching policy to apply to the file. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this file, the system uses the caching policy that is assigned to the containing volume. If a caching policy is not assigned to the containing volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

[-autodelete {true|false}] - Mark Clone for Autodeletion

This parameter marks the file, LUN or NVMe namespace clones created for auto deletion. When set to true, the file, LUN or NVMe namespace clones get automatically deleted when the volume runs out of space. The default value is false.

[-bypass-throttle {true|false}] - Bypass Throttle Checks (privilege: advanced)

This parameter specifies whether clone throttle checks should be skipped during clone creation. When set to true, clones are created without enforcing any clone throttle checks. The default value is false.

[-is-backup {true|false}] - Is a Clone for Backup

This parameter is used to mark the destination file as a backup clone, where divergence is expected on the source file and no divergence is expected on the destination file. It is applicable only for full-file clones created from Active File System volumes. The default value is *false*.

[-destination-volume <volume name>] - Destination Volume

This specifies the name of the volume where the destination file resides. This can be different from parameter 'volume', whereas parameter 'volume' specifies the volume on which source file resides. This is an optional argument applicable only for Metawaf volume where the source and destination volumes for the clone operation can be different. If this parameter is not given the destination file will get created in the volume where source_file resides.

Examples

The following command creates a FlexClone file of the file named *myfile* contained in a volume named *vol*. The file *myfile* is located in the root directory of that volume. The cloned file *myfile_copy* resides in the root directory same volume.

```
cluster1::> volume file clone create -volume vol -source-path /myfile -destination-path /myfile_copy
```

The following command optionally associates the FlexClone file named *myfile_copy* with the *fast* QoS policy group and the caching policy named random-read.

```
cluster1::> volume file clone create -volume vol -source-path /myfile -destination-path /myfile_copy -qos-policy-group fast -caching-policy
```

volume file clone show-autodelete

Show the autodelete status for a file or LUN clone

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume file clone show-autodelete` command displays the autodelete details of a file, LUN or NVMe namespace clone. The command displays the following information about a file, LUN or NVMe namespace clone:

- Vserver Name
- Clone Path
- Whether auto deletion of file, LUN or NVMe namespace clone is enabled

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

-vserver <vserver name> - Vserver Name

This specifies the Vserver to which the file, LUN or NVMe namespace clone belongs.

-clone-path <text> - Clone Path

This specifies the path of the file, LUN or NVMe namespace clone.

[-autodelete-enabled {true|false}] - Autodelete Enabled

If this parameter is true, the file, LUN or NVMe namespace clone gets automatically deleted in the 'try' or 'disrupt' mode. If the value is false, the clones get automatically deleted only in the 'destroy' mode.

Examples

The following example displays the autodelete information about a file, LUN or NVMe namespace clone.

```
cluster1::> volume file clone show-autodelete -vserver vs1 -clone-path /vol/v1/f1
```

```
Vserver Name: vs1
Clone Path: /vol/v1/f1
Autodelete Enabled: true
```

volume file clone deletion commands

The deletion directory

volume file clone deletion add-extension

Add new supported file extensions to be deleted with clone delete

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume file clone deletion add-extension` command can be used to add new supported file extensions for clone delete. This command is not supported on Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver Name

Name of the vsserver.

-volume <volume name> - Volume Name

Name of the volume.

-extensions <text> - Supported Extensions for Clone Delete

List of supported file extensions for clone delete.

Examples

The following example adds the new supported *vmdk,vhd* file extensions to volume *vol1* of vsserver *vs1*.
cluster1::> volume file clone deletion add-extension -vsserver vs1 -volume vol1 -extensions vmdk,vhd

volume file clone deletion modify

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume file clone deletion modify` command can be used to change the required minimum clone file size of a volume for clone delete. This is not applicable on Infinite volumes.

Parameters

-vsserver <vsserver name> - Vserver Name

Name of the vsserver.

-volume <volume name> - Volume Name

Name of the volume.

[-minimum-size {<integer>[KB|MB|GB|TB|PB]}] - Minimum Size Required for Clone delete

Minimum clone file size required for clone delete.

Examples

The following example changes the required minimum file size to 100M for volume *vol1* of vsserver *vs1*.
cluster1::> volume file clone deletion modify -volume vol1 -vsserver vs1 -minimum-size 100M

volume file clone deletion remove-extension

Remove unsupported file extensions for clone delete

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume file clone deletion remove-extension` command can be used to remove the existing file extensions that are no longer supported for clone delete. This command is not supported on Infinite Volumes.

Parameters

-vsserver <vsserver name> - Vserver Name

Name of the vsserver.

-volume <volume name> - Volume Name

Name of the volume.

[-extensions <text>] - Unsupported Extensions for Clone Delete

List of unsupported file extensions for clone delete.

Examples

The following example removes the existing unsupported *vmdk, vhd* file extensions to volume *vol1* of vsserver *vs1*.

```
cluster1::> volume file clone deletion remove-extension -vserver vs1 -volume vol1 -extensions vmdk,vhd
```

volume file clone deletion show

Show the supported file extensions for clone delete

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume file clone deletion show` command displays the following information for clone delete:

- Vserver Name
- Volume Name
- Minimum File Size Required for Clone Delete
- List of Supported File Extensions for Clone Delete

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

Name of the vservers.

[-volume <volume name>] - Volume Name

Name of the volume.

[-extensions <text>, ...] - Supported Extensions for Clone Delete

List of supported file extensions for Clone Delete.

[-minimum-size {<integer>[KB|MB|GB|TB|PB]}] - Minimum Size Required for Clone delete

Minimum file size required for Clone Delete.

Examples

The following example displays the clone deletion information for all volumes of all vservers.

```
cluster1::> volume file clone deletion show
```

Vserver	Volume	Minimum Size	Extensions
vs0	testvol	100B	vmdk, vhd, vhdx, vswp
	vs0_root	0B	-
vs1	testvol	100B	vmdk, vhd, vhdx, vswp
	vs1_root	0B	-

The following example displays the clone deletion information for volume *vol1* of vservers *vs1*.

```
cluster1::> volume file clone deletion show -vserver vs0 -volume testvol
Vserver Name: vs0
Volume Name: testvol
Supported Extensions for Clone Delete: vmdk, vhd, vhdx, vswp
Minimum Size Required for Clone delete: 100B
```

volume file clone split commands

Manage file clone split operations

volume file clone split load commands

Manage load due to file clone split operations

volume file clone split load modify

Modify maximum split load on a node

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `volume file clone split load modify` command can be used to change the maximum split load (file, LUN or NVMe namespace clones) of a node.

Parameters

-node {<nodename>|local} - Node Name

Node name on which the new maximum split load is being applied.

[-max-split-load {<integer>[KB|MB|GB|TB|PB]] - Maximum Clone Split Load

This specifies the new maximum split load of a node. This is the amount of clone create load, the node can take at any point of time. If it crosses this limit, then the clone create requests will not be allowed, till the split load is less than maximum split load

Examples

The following example changes the new maximum limit to 10TB on node1.

```
cluster1::*> volume file clone split load*> modify -node clone-01 -max-split-load 100KB
```

volume file clone split load show

Show split load on a node

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume file clone split load show` command displays the corresponding file, LUN or NVMe namespace clone split loads on nodes. If no parameters are specified, the command displays the following information:

- Node
- Max Split Load
- Current Split Load
- Token Reserved Load
- Allowable Split Load

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node Name

Node on which the file, LUN or NVMe namespace clone split load is displayed.

[-max-split-load {<integer>[KB|MB|GB|TB|PB]] - Maximum Clone Split Load

This specifies the maximum allowable split load on the node.

[-current-split-load {<integer>[KB|MB|GB|TB|PB]] - Current Clone Split Load

This specifies the current on going split load on the node.

[-token-reserved-load {<integer>[KB|MB|GB|TB|PB]] - Load Reserved for Clone Creation

This specifies the reserved split load of the node using the tokens.

[-allowable-split-load {<integer>[KB|MB|GB|TB|PB]] - Allowable Clone Split Load

This specifies the available split load of the node.

Examples

The following example displays the current and allowable file, LUN or NVMe namespace clone split load on a node.

```
cluster1::> volume file clone split load show
Node                               Max      Current   Token      Allowable
      Split Load Split Load Reserved Load Split Load
-----
clone-01                          15.97TB      0B        100MB      15.97TB
clone-02                          15.97TB      0B        100MB      15.97TB
2 entries were displayed.
```

```
cluster1::> volume file clone split load show -node clone-01 -instance
```

```

Node Name: clone-01
Maximum Clone Split Load: 15.97TB
Current Clone Split Load: 0B
Load Reserved for Clone Creation: 100MB
Allowable Clone Split Load: 15.97TB
```

volume file fingerprint commands

File fingerprint related commands

volume file fingerprint abort

Abort a file fingerprint operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume file fingerprint abort` command aborts an in-progress fingerprint operation. This command only aborts the fingerprint operations that have not yet completed. This command takes session-id as input and aborts the fingerprint operation that is associated with that particular session-id.

Parameters

-session-id <integer> - Session ID of Fingerprint Operation

Specifies the session-id of the fingerprint operation that needs to be aborted. It is a unique identifier for the fingerprint operation. This session-id is returned when the fingerprint operation is started on a file.

Examples

The following example aborts the fingerprint operation identified by *17039361*:

```
cluster1::> volume file fingerprint abort -session-id 17039361
```

volume file fingerprint dump

Display fingerprint of a file

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume file fingerprint dump` command displays the following information given the `-session-id` of the fingerprint operation:

- **Vserver:**
The Vserver on which the file exists.
- **Session-ID:**
A unique identifier for the fingerprint operation. This session-id is returned when the fingerprint operation is started on a file. The session-id of the fingerprint operation can be used to get the progress of an ongoing fingerprint operation as well as the complete fingerprint output for the file once the operation is completed.
- **Volume:**
The name of the volume on which the file resides.
- **Path:**
The absolute path of the file on which the fingerprint is calculated. The value begins with `/vol/<volumename>`.
- **Data Fingerprint:**
The digest value of data of the file. The fingerprint is base64 encoded. This field is not included if the scope is *metadata-only*.
- **Metadata Fingerprint:**
The digest value of metadata of the file. The metadata fingerprint is calculated for file size, file ctime, file mtime, file crtime, file retention time, file uid, file gid, and file type. The fingerprint is base64 encoded. This field is not included if the scope is *data-only*.
- **Fingerprint Algorithm:**
The digest algorithm which is used for the fingerprint computation. Fingerprint is computed using *md5* or *sha-256* digest algorithm.
- **Fingerprint Scope:**
The scope of the file which is used for the fingerprint computation. Fingerprint is computed over *data-only*, *metadata-only*, or *data-and-metadata*.
- **Fingerprint Start Time:**
The start time of the fingerprint computation in seconds since 1 January 1970 00:00:00 in GMT timezone.
- **Formatted Fingerprint Start Time:**
The start time of the fingerprint computation in a human-readable format `<day> <month> <day of month> <hour>:<min>:<sec><year>` in GMT timezone.
- **Fingerprint Version:**
The version of the fingerprint output format.
- **SnapLock License:**
The status of the SnapLock license.
- **Vserver UUID:**
A universal unique identifier for the Vserver on which the file exists.
- **Volume MSID:**
The mirror set identifier of the volume where the file resides.

- Volume DSID:
The data set identifier of the volume where the file resides.
- Hostname:
The name of the storage system where the fingerprint operation is performed.
- Filer ID:
The NVRAM identifier of the storage system.
- Volume Containing Aggregate:
The name of the aggregate in which the volume resides.
- Aggregate ID:
A universal unique identifier for the aggregate containing the volume.
- SnapLock System ComplianceClock:
The System ComplianceClock time in seconds since 1 January 1970 00:00:00 in GMT timezone if it is initialized.
- Formatted SnapLock System ComplianceClock:
The System ComplianceClock time in a human-readable format <day> <month> <day of month> <hour>: <min>:<sec><year> in GMT timezone if it is initialized.
- Volume SnapLock Type:
The type of the SnapLock volume. This value is only given for SnapLock volumes. Possible values are *compliance* and *enterprise*.
- Volume ComplianceClock:
The volume ComplianceClock time in seconds since 1 January 1970 00:00:00 in GMT timezone. This has a value only for SnapLock volumes.
- Formatted Volume ComplianceClock:
The volume ComplianceClock time in a human-readable format <day> <month> <day of month> <hour>: <min>:<sec><year> in GMT timezone. This has a value only for SnapLock volumes.
- Volume Expiry Date:
The expiry date of the SnapLock volume in seconds since 1 January 1970 00:00:00 in GMT timezone. The volume expiry date can be in wraparound format.
- Is Volume Expiry Date Wraparound:
The value is *true* if the volume expiry date is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.
- Formatted Volume Expiry Date:
The expiry date of the SnapLock volume in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone. The volume expiry date can be in wraparound format.
- Filesystem ID:
The filesystem identifier of the volume on which the file resides.
- File ID:
A unique number within the filesystem identifying the file.
- File Type:

The type of the file. Possible values include: *worm*, *worm_appendable*, *worm_active_log*, *worm_log*, and *regular*.

- File Size:

The size of the file in bytes.

- Creation Time:

The creation time of the file in seconds since 1 January 1970 00:00:00 in GMT timezone.

- Formatted Creation Time:

The creation time of the file in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

- Modification Time:

The last modification time of the file in seconds since 1 January 1970 00:00:00 in GMT timezone.

- Formatted Modification Time:

The last modification time of the file in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

- Changed Time:

The last changed time of the file attributes in seconds since 1 January 1970 00:00:00 in GMT timezone. Time is taken from the system clock for regular files and from the volume ComplianceClock for WORM files when they are committed. The changed time can be in wraparound format.

- Is Changed Time Wraparound:

The value is *true* if the last changed time of the file attributes is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.

- Formatted Changed Time:

The last changed time of the file attributes in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone. The changed time can be in wraparound format.

- Retention Time:

The retention time of the files committed to WORM on SnapLock volumes in seconds since 1 January 1970 00:00:00 in GMT timezone. The retention time can be in wraparound format.

- Is Retention Time Wraparound:

The value is *true* if the retention time of the file is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.

- Formatted Retention Time:

The retention time of the files protected by SnapLock in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone. The retention time can be in wraparound format.

- Access Time:

The last access time of the regular files on SnapLock volumes and files on non-SnapLock volumes attributes in seconds since 1 January 1970 00:00:00 in GMT timezone.

- Formatted Access Time:

The last access time of the regular files on SnapLock volumes and files on non-SnapLock volumes attributes in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

- Owner ID:
The integer identifier of the owner of the file.
- Group ID:
The integer identifier of the group owning the file.
- Owner SID:
The security identifier of the owner of the file when it has NTFS security style.
- Fingerprint End Time:
The end time of the fingerprint computation in seconds since 1 January 1970 00:00:00 in GMT timezone.
- Formatted Fingerprint End Time:
The end time of the fingerprint computation in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.
- Litigation Count:
The number of litigations on the file.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

-session-id <integer> - Session ID of Fingerprint Operation

Specifies the session-id of the fingerprint operation whose output is to be displayed. It is a unique identifier for the fingerprint operation. This session-id is returned when the fingerprint operation is started on a file.

Examples

The following example displays the fingerprint information of the fingerprint session identified by session-id 17039367:

```
cluster1::> volume file fingerprint dump -session-id 17039367

Vserver:vs1
Session-ID:17039367
Volume:nfs_slc
Path:/vol/nfs_slc/worm
Data Fingerprint:MOFJVevxNSJm3C/4Bn5oEEYH51Crud0zZYK4r5Cfy1g=

volume file fingerprint show

Display fingerprint operation status

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume file fingerprint show` command returns information for one or several fingerprint operations. This command requires either `-session-id` or `-vserver` and `-volume`.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-session-id <integer>] - Session ID of Fingerprint Operation

If this parameter is specified, the command returns the progress of the fingerprint operation of the specified session-id. The session-id is a unique identifier for the fingerprint operation that is returned when the fingerprint operation is started on a file.

[-vserver <vserver name>] - Vserver

If this parameter is specified, `-volume` must also be specified. When queried with `-vserver` and `-volume`, the command returns the progress of all the fingerprint operations running on that particular volume.

[-volume <volume name>] - Volume Name

If this parameter is specified, `-vserver` must also be specified. When queried with `-vserver` and `-volume`, the command returns the progress of all the fingerprint operations running on that particular volume.

[-file </vol/<volume name>/<file path>>] - File Path

If this parameter is specified, the command returns the progress of all fingerprint operations on the specified file.

[-operation-status {Unknown|In-Progress|Failed|Aborting|Completed}] - Operation Status

If this parameter is specified, the command returns the progress of all fingerprint operations with matching status value.

[-progress-percentage <integer>] - Progress Percentage

If this parameter is specified, the command returns the progress of all fingerprint operations with matching progress percentage value.

Examples

The following example displays the progress of all the fingerprint operations running on volume *nfs_slc*:

```
cluster1::> volume file fingerprint show -vserver vs0 -volume nfs_slc
```

File-Path	Session-ID	Status	Progress Percentage
/vol/nfs_slc/worm	17104897	Completed	100
/vol/nfs_slc/worm_appedable	17104898	Completed	100
/vol/nfs_slc/regular	17104899	In-Progress	30

3 entries were displayed.

volume file fingerprint start

Start a file fingerprint computation on a file

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume file fingerprint start` command starts the fingerprint computation on a file. The fingerprint computation is started on the file, and a session-id is returned. This session-id is a unique identifier for the fingerprint operation and can be used to get the progress of an ongoing fingerprint operation as well as the complete fingerprint output for the file once the operation is completed.

Parameters

-vserver <vserver name> - Vserver

Specifies the name of the vservers which owns the volume on which the file resides.

-file </vol/<volume name>/<file path>> - Path

Specifies the absolute path of the file on which fingerprint needs to be calculated. The value begins with `/vol/<volumename>`.

[-algorithm {MD5|SHA256}] - Fingerprint Algorithm

Specifies the digest algorithm which is used for the fingerprint computation.

Fingerprint can be computed using one of the following digest algorithms:

- md5
- sha-256

[-scope {data-and-metadata|data-only|metadata-only}] - Fingerprint Scope

Specifies the scope of the file which is used for the fingerprint computation.

Fingerprint can be computed using one of the following scope:

- data-only
- metadata-only
- data-and-metadata

Examples

The following example starts computing fingerprint over data and metadata for file `/vol/nfs_slc/worm` using `md5` hash algorithm. The file `/vol/nfs_slc/worm` is stored in volume *nfs_slc* on Vserver *vs0*.

```
cluster1::> volume file fingerprint start -vserver vs0 -scope data-and-metadata -algorithm md5 -file /vol/nfs_slc/worm
File fingerprint operation is queued. Run "volume file fingerprint show -session-id 16973825" to view the fingerprint session status.
```

volume file retention commands

SnapLock file retention-related commands

volume file retention show

Display retention time of a file protected by SnapLock.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume file retention show` command displays the retention time of a file protected by SnapLock given `-vserver` and `-file`.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

Specifies the name of the Vserver which has the file.

[-file </vol/<volume name>/<file path>>] - File path

Specifies the absolute path of the file. The value begins with `/vol/<volumename>`.

[-retention-time <integer>] - Retention Time of the File

If this parameter is specified, the command returns the retention time of the file protected by SnapLock if its retention time in seconds since 1 January 1970 00:00:00 matches the specified value.

[-formatted-retention-time <text>] - Formatted Retention Period

If this parameter is specified, the command returns the retention time of the file protected by SnapLock if its expiry date matches the specified value. The expiry date format is `<day> <month> <day of month> <hour>:<min>:<sec><year>` in GMT timezone taking care of wraparound. A value of *infinite* indicates that this file has infinite retention time. A value of *indefinite* indicates that this file has indefinite retention time.

[-is-wraparound {true|false}] - Is Retention Time Wraparound

If this parameter is specified, the command returns the retention time of the file protected by SnapLock if it has a matching `-is-wraparound` value. The value is `true` if the date represented in retention time is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.

Examples

The following example displays the retention time of the file `/vol/nfs_slc/f12`:

```
cluster1::> volume file retention show -vserver vs0 -file /vol/nfs_slc/f12

Vserver : vs0
Path : /vol/nfs_slc/f12
Retention Time (Secs from Epoch) : 1439111404
Formatted Retention Time : Sun Aug 9 09:10:04 GMT 2015
Is Retention Time Wraparound : false
```

volume flexgroup commands

Manage FlexGroup operations

volume flexgroup deploy

Deploy a FlexGroup on the cluster

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume flexgroup deploy` command deploys a FlexGroup on the cluster.

The FlexGroup is created with 8 constituents on each node in the cluster. The constituents are split equally between the two largest aggregates on each node. If using two aggregates per node is not possible, all of the constituents are created on the largest aggregate on each node.

The `volume flexgroup deploy` command is only supported on clusters with 4 nodes or less. On clusters with more than 4 nodes, use the [“volume create” on page 1310](#) command to create FlexGroups.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the FlexGroup will be located.

-size {<integer>[KB|MB|GB|TB|PB]} - Size of the FlexGroup

This specifies the size of the FlexGroup. The size is specified as a number followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), t (terabytes), or p (petabytes). If the unit designation is not specified, bytes are used as the unit and the specified number is rounded up to the nearest 4 KB. The minimum size is 160 MB multiplied by the number of nodes in the cluster. The maximum size of the FlexGroup is limited by the platform maximum FlexVol size multiplied by 8 and multiplied by the number of nodes in the cluster. The size of the FlexGroup is also limited by the available space in the hosting aggregates. FlexGroups can be increased in size with the [“volume modify” on page 1321](#) command and more constituents can be added with the [“volume expand” on page 1319](#) command.

[-volume <volume name>] - Name of the FlexGroup to Create

This specifies the name of the FlexGroup. The name of the FlexGroup must start with an alphabetic character (a to z or A to Z) and must have 197 or fewer characters. The default value for the FlexGroup name is “fg”.

[-type {RW|DP}] - Volume Type

This optionally specifies the FlexGroup's type, either read-write (RW) or data-protection (DP). If you do not specify a value for this parameter, a RW volume is created by default.

[-space-guarantee {none|volume}] - Space Guarantee Style

This optionally specifies the space guarantee style for the FlexGroup. A value of *volume* reserves space on the aggregates for the entire volume. A value of *none* reserves no space on the aggregates, meaning that writes can fail if an aggregate runs out of space. Because CIFS does not handle out-of-space conditions, do not use the value *none* if the volume is accessible to CIFS clients. The default setting for volumes on All Flash FAS systems is *none*, otherwise the default setting is *volume*.

[-foreground {true|false}] - Foreground Process

If this parameter is specified with *false*, the command runs in the background as a job. Otherwise, the command does not return until the operation is complete. The default value is *true*

Examples

The following example deploys a FlexGroup named "flexgroup" in the Vserver named "vs1.example.com":
cluster::> volume flexgroup deploy -size 400TB -vserver vs1.example.com -volume flexgroup

volume flexgroup qtree-disable

Disable qtree support on a FlexGroup

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `volume flexgroup qtree-disable` command disables qtree support on a FlexGroup.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver in which the FlexGroup is located.

-volume <volume name> - Volume Name

This specifies the name of the FlexGroup.

Examples

The following example disables the qtree support on a FlexVol named "fg" in Vserver "vs0":
cluster:*> volume flexgroup qtree-disable -vserver vs0 -volume fg

volume inode-upgrade commands

Manage volume inode upgrade

volume inode-upgrade prepare-to-downgrade

Prepare volume to downgrade to a release earlier than Data ONTAP 9.0.0

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `volume inode-upgrade prepare-to-downgrade` command prepares volumes to downgrade to a release earlier than Data ONTAP 9.0.0. It is used when there are still volumes in the middle of the inode upgrade process when revert is issued.

Parameters

-node {<nodename>|local} - Node Name

This specifies the node on which the command will run. Default is the local node.

Examples

The following example prepares volumes to revert to an earlier release.
cluster1::> volume inode-upgrade prepare-to-downgrade -node node1

volume inode-upgrade resume

Resume suspended inode upgrade

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `volume inode-upgrade resume` command resumes suspended inode upgrade process. The inode upgrade process may be suspended earlier due to performance reasons.

Parameters

-vserver <vserver name> - VServer Name

This specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This specifies the volume for which the inode upgrade process is to be resumed.

Examples

The following example resumes a volume upgrade process.

```
cluster1::> volume inode-upgrade resume -vserver vs0 -volume vol1
```

volume inode-upgrade show

Display Inode Upgrade Progress

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `volume inode-upgrade show` command displays information about volumes in the middle of the inode upgrade process. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the default fields about all volumes in the middle of the inode upgrade process. Default fields are [Chapter 29 “vserver” on page 1513](#), [Chapter 28 “volume” on page 1309](#), aggregate, status, scan-percent, remaining-time, space-needed, and scanner-progress.

Parameters

{ [-fields <fieldname>, ...]

This specifies the fields that need to be displayed.

| [-instance]}

If this parameter is specified, the command displays information about all entries.

[-vserver <vserver name>] - Vserver

If this parameter and the `-volume` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

[-volume <volume name>] - Volume

If this parameter and the `-vserver` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes that match the specified name.

[-node <nodename>] - Node Name

If this parameter is specified, the command displays information only about the volume or volumes that are located on the specified storage system.

[-vol-dsid <integer>] - Volume DSID

If this parameter is specified, the command displays information only about the volume or volumes that match the specified data set ID.

[-vol-uuid <UUID>] - Volume UUID

If this parameter is specified, the command displays information only about the volume or volumes that match the specified UUID.

[-volume-msid <integer>] - Volume MSID

If this parameter is specified, the command displays information only about the volume or volumes that match the specified master data set ID.

[-vserver-uuid <UUID>] - Vserver UUID

If this parameter is specified, the command displays information only about the volume on the Vserver that has the specified UUID.

[-aggregate <aggregate name>] - Aggregate Name

If this parameter is specified, the command displays information only about the volume or volumes that are located on the specified storage aggregate.

[-aggregate-uuid <UUID>] - Aggregate UUID

If this parameter is specified, the command displays information only about the volume or volumes that are located on the storage aggregate with the specified UUID.

[-status {pending|scanning|suspended-initializing|suspended|cleanup-pending|cleanup|cleanup-done|suspended-aborting|suspended-removing|suspended-while-removing|suspended-ironing}] - Upgrade Status

If this parameter is specified, the command displays information only about the volume or volumes that match the specified inode upgrade status.

[-scan-percent <percent>] - Upgrade Scan Percent Complete

If this parameter is specified, the command displays information only about the volume or volumes that match the specified inode upgrade progress percentage.

[-space-needed {<integer>[KB|MB|GB|TB|PB]}] - Space Needed to Complete Upgrade

If this parameter is specified, the command displays information only about the volume or volumes where the space needed to complete the upgrade process match the specified size.

[-remaining-time <[<integer>h][<integer>m][<integer>s]>] - Remaining Upgrade Time

If this parameter is specified, the command displays information only about the volume or volumes where the remaining time to complete the inode upgrade process match the specified time.

[-scanner-progress <text>] - Scanner Progress

If this parameter is specified, the command displays information only about the volume or volumes where the progress of the inode upgrade process match the input.

Examples

The following example displays information about all volumes in the middle of the inode upgrade process on the Vserver named vs0:

```
cluster1::> volume inode-upgrade show -vserver vs0
Vserver Volume Aggregate Status %Complete Time      Space   Inode
                               Remaining Needed Progress
-----
vs0      vol1      aggr1      pending    0%      -        3.07MB Public : Inode 0 out of 3822
```

Volume Move commands

Manage volume move operations

The `volume move` commands enable you to manage operations regarding moving a volume from one storage aggregate to another storage aggregate

volume move abort

Stop a running volume move operation

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The "volume move abort" command sends an abort message to the volume move operation and returns immediately. The volume move operation might not abort immediately depending on the stage it is in. For example, if the volume move operation is in a cut-over or clean-up phase, the abort is ignored. You invoke the "volume move show" command to view the list of running volume move operations and monitor the progress of the abort operation. This command has the same behavior as the ["job stop" on page 167](#) -id <job-id> command where the job-id is the identifier of the volume move job.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This specifies the name of the volume being moved.

Examples

The following example aborts running volume move operation on volume *vol1*

```
cluster1::> volume move show
Vserver  Volume  State  Move Phase Percent-Complete Time-To-Complete
-----
vs0      vol1     alert  cutover_hard_deferred 0%      -
vs0      vol2     failed failed          -          -
2 entries were displayed.

cluster1::> volume move abort -vserver vs0 -volume vol1

cluster1::> volume move show -vserver vs0 -volume vol1 -fields completion-status
vserver volume completion-status
-----
vs0      vol1     "Volume move job stopped."
```

The following example shows command failed to abort on *vol2* as volume move operation is completed.

```
cluster1::> volume move show
Vserver  Volume  State  Move Phase Percent-Complete Time-To-Complete
-----
vs0      vol1     alert  cutover_hard_deferred 0%      -
vs0      vol2     failed failed          -          -
2 entries were displayed.

cluster1::> volume move abort -vserver vs0 -volume vol2

Error: command failed: There is no volume move operation running on the
specified volume.
```

volume move modify

Modify parameters for a running volume move operation

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `volume move modify` command modifies the parameters used by the volume move operation in progress. These modified values can be verified by invoking the ["volume move show" on page 1431](#)

command. The volume move operation will use the modified cutover parameters in its next cutover attempt. Note that the modifications to the job are not applied if the move is in the "finishing" state.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This specifies the name of the volume being moved.

[-cutover-action {abort_on_failure|defer_on_failure|force|wait|retry_on_failure}] - Specified Action For Cutover

Specifies the action to be taken for cutover. If the effective cluster version is Data ONTAP 8.3 and later, the default is *retry_on_failure*; otherwise the default is *defer_on_failure*. If the *abort_on_failure* action is specified, the job will try to cutover until cutover attempts are exhausted. If it fails to cutover, it will cleanup and end the operation. If the *defer_on_failure* action is specified, the job will try to cutover until the cutover attempts are exhausted. If it fails to cutover, it will move into the "cutover_hard_deferred" state. The volume move job waits for a ["volume move trigger-cutover" on page 1439](#) command to restart the cutover process. If the *force* action is specified, the job will try to cutover until the cutover attempts are exhausted and force the cutover at the expense of disrupting the clients. If the *wait* action is specified, when the job hits the decision point, it will not go into cutover automatically, instead it will wait for a ["volume move trigger-cutover" on page 1439](#) command as the signal to try the cutover.

[-cutover-window <integer>] - Specified Cutover Time Window

This specifies the time interval in seconds to completely cutover operations from the original volume to the moved volume. The default value is 30 seconds. The range for valid input is from 30 to 300 seconds, inclusive.

Examples

The following example modifies the parameters for volume move operation on volume vol2.

```
cluster1::*> volume move show -vserver vs0 -volume vol2

      Vserver Name: vs0
      Volume Name: vol2
Actual Completion Time: -
      Bytes Remaining: 172KB
Specified Action For Cutover: wait
Specified Cutover Time Window: 40
      Time Cutover was Triggered: -
Time Cutover was last triggered: -
      Destination Aggregate: node_1_aggr1
      Destination Node: node_1
      Detailed Status: Cutover Deferred, Waiting for user intervention(69.79MB Sent)::Volume move job preparing transfer
Estimated Time of Completion: -
      Job ID: 105
      Managing Node: node-2
      Percentage Complete: 50%
      Move Phase: cutover_hard_deferred
Estimated Remaining Duration: -
Replication Throughput: -
      Duration of Move: 1 days 00:04
      Source Aggregate: node_2_aggr1
      Source Node: node_2
      Start Time of Move: Sun Sep 18 16:40:37 2011
      Move State: alert

cluster1::*> volume move modify -vserver vs0 -volume vol2 -cutover-action abort_on_failure -cutover-window 50

cluster1::*> volume move show -vserver vs0 -volume vol2

      Vserver Name: vs0
      Volume Name: vol2
Actual Completion Time: -
```

```

        Bytes Remaining: 172KB
    Specified Action For Cutover: abort_on_failure
    Specified Cutover Time Window: 50
    Time Cutover was Triggered: -
    Time Cutover was last triggered: -
        Destination Aggregate: node_1_aggr1
        Destination Node: node_1
        Detailed Status: Cutover Deferred, Waiting for user intervention(69.79MB Sent)::Volume move job preparing transfer
    Estimated Time of Completion: -
        Job ID: 106
        Managing Node: node-2
        Percentage Complete: 50%
        Move Phase: cutover_hard_deferred
    Estimated Remaining Duration: -
    Replication Throughput: -
        Duration of Move: 1 days 00:05
        Source Aggregate: node_2_aggr1
        Source Node: node_2
    Start Time of Move: Sun Sep 18 16:40:37 2011
    Move State: alert

```

The following example shows command failed to modify on vol1 as volume move operation is completed.

```

cluster1::*> volume move show -vserver vs0 -volume vol1

        Vserver Name: vs0
        Volume Name: vol1
    Actual Completion Time: Sun Sep 18 16:34:27 2011
        Bytes Remaining: 172KB
    Specified Action For Cutover: wait
    Specified Cutover Time Window: 30
    Time Cutover was Triggered: -
    Time Cutover was last triggered: -
        Destination Aggregate: node_1_aggr1
        Destination Node: node_1
        Detailed Status: Volume move failed because of a job restart
    Estimated Time of Completion: -
        Job ID: 108
        Managing Node: node-2
        Percentage Complete: -
        Move Phase: failed
    Estimated Remaining Duration: -
    Replication Throughput: -
        Duration of Move: 15 days 08:07
        Source Aggregate: node_2_aggr1
        Source Node: node_2
    Start Time of Move: Sat Sep 03 08:27:06 2011
    Move State: failed

cluster1::*> volume move modify -vserver vs0 -volume vol1 -cutover-action abort_on_failure -cutover-window 40
Error: command failed: There is no volume move operation running on the specified volume.

```

volume move show

Show status of a volume moving from one aggregate to another aggregate

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `volume move show` command displays information about volume moves in the cluster. By default, with no parameters, it only shows volume moves that have failed or are currently running. The command display

output depends on the parameters passed. If `-vserver` and `-volume` are specified, the following information is displayed:

- **Vserver Name:** The Vserver on which the volume is located.
- **Volume Name:** The volume that is part of a completed or running volume move operation.
- **Actual Completion Time:** The date and time in the cluster time zone when the volume move completed.
- **Bytes Remaining:** The number of bytes remaining to be sent during volume move. This is an approximate number and lags the current status by a few minutes while the volume move is in operation.
- **Specified Action for Cutover:** The action to be taken for cutover or during cutover failure. This is the input given during the start of volume move or the value specified during a volume move modification.
- **Specified Cutover Time Window:** The time window in seconds given as an input for the cutover phase of volume move. This is the input given during the start of volume move or the value specified during a volume move modification.
- **Job ID:** The Job-ID of move job.
- **Destination Node:** The name of the node where the destination aggregate is present.
- **Source Node:** The name of the node where the source aggregate is present.
- **Prior Issues Encountered:** The latest issues or transient errors encountered causing the move operation to retry the data copy phase or the cutover phase.
- **Move Initiated by Auto Balance Aggregate:** The value "true" indicates the move is initiated by Auto Balance Aggregate feature.
- **Destination Aggregate:** The name of the aggregate to which the volume is moved.
- **Detailed Status:** The detail about any warnings, errors, and state of the move operation.
- **Estimated Time of Completion:** The approximate date and time in the cluster time zone when the entire volume move operation is expected to complete. Note that this time may keep increasing when the move goes into cutover-deferred mode. In those cases where the input for cutover-action is wait, during the data copy phase, the estimated time of completion will approximate the time to reach the cutover point and wait for user intervention.
- **Managing Node:** The node in the cluster on which the move job is or was running. This is usually on the node hosting the volume to be moved.
- **Percentage Complete:** The amount of work to move the volume completed thus far in terms of percentage.
- **Move Phase:** The phase of the move operation.
- **Estimated Remaining Duration:** The approximate amount of time in terms of days, hours, minutes and seconds remaining to complete the volume move.
- **Replication Throughput:** The current replication throughput of the move operation in terms of Kb/s, Mb/s or Gb/s.
- **Duration of Move:** The duration in days, hours and minutes for which the volume move was or is in progress.
- **Source Aggregate:** The name of the aggregate where the volume being moved originally resides or resided.
- **Start Time of Move:** The date and time in the cluster time zone when the volume move operation started.
- **Move State:** The state of the volume move at the time of issuing the command and the system gathering up the information about the move.
- **Original Job ID:** The job-id assigned when the job was first created. This value will only be populated when the original job-id differs from the current job-id.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

This specifies the Vserver on which the volume is located. If this parameter and the -volume parameter are specified, the command displays detailed information about latest move performed on the specified volume. If this parameter is specified by itself, the command displays information about latest moves performed on volumes of the specified Vserver.

[-volume <volume name>] - Volume Name

This specifies the volume that is part of a completed or running volume move operation. If this parameter and the -vserver parameter are specified, the command displays detailed information about latest move performed on the specified volume. If this parameter is specified by itself, the command displays information about the latest move on all volumes matching the specified name.

[-actual-completion-time <Date>] - Actual Completion Time

If this parameter is specified, the command displays move operations that match the specified date and time in the cluster time zone when the volume move completed.

[-bytes-remaining {<integer>[KB|MB|GB|TB|PB]] - Bytes Remaining

If this parameter is specified, the command displays move operations that match the specified number of bytes remaining to be sent during volume move.

[-cutover-action {abort_on_failure|defer_on_failure|force|wait|retry_on_failure}] - Specified Action For Cutover (privilege: advanced)

If this parameter is specified, the command displays move operations that match the specified action to be taken for cutover or during cutover failure.

[-cutover-window <integer>] - Specified Cutover Time Window (privilege: advanced)

If this parameter is specified, the command displays move operations that match the specified time window in seconds for the cutover phase of volume move.

[-destination-aggregate <aggregate name>] - Destination Aggregate

If this parameter is specified, the command displays move operations that match the specified name of the aggregate to which the volume is being moved.

[-destination-node <nodename>] - Destination Node (privilege: advanced)

If this parameter is specified, the command displays move operations that match the specified name of the node where the destination aggregate is present.

[-details <text>] - Detailed Status

If this parameter is specified, the command displays move operations that match the specified detail about any warnings, errors and state of the move operation.

[-estimated-completion-time <Date>] - Estimated Time of Completion

If this parameter is specified, the command displays move operations that match the specified date and time in the cluster time zone when the entire volume move operation is expected to complete.

[-job-id <integer>] - Job ID (privilege: advanced)

If this parameter is specified, the command displays move operations that match the specified Job-ID of the move job.

[-managing-node <nodename>] - Managing Node

If this parameter is specified, the command displays move operations that match the specified node in the cluster on which the move job is or was running.

[-percent-complete <percent>] - Percentage Complete

If this parameter is specified, the command displays move operations that match the specified amount of work to move the volume completed thus far in terms of percentage.

[-phase {queued|initializing|replicating|cutover|cutover_hard_deferred|cutover_soft_deferred|aborting|completed|cleaning_up|failed|restarting|finishing}] - Move Phase

If this parameter is specified, the command displays move operations that match the specified phase of the move operation.

[-prior-issues <text>] - Prior Issues Encountered (privilege: advanced)

If this parameter is specified, the command displays move operations that match the specified issues or transient errors encountered causing the move operation to retry the data copy phase or the cutover phase.

[-estimated-remaining-duration {<seconds>|[<d> days] <hh>:<mm>[:<ss>]]] - Estimated Remaining Duration

If this parameter is specified, the command displays move operations that match the specified time.

[-replication-throughput <text>] - Replication Throughput

If this parameter is specified, the command displays move operations that match the specified replication throughput of the move operation in terms of Kb/s, Mb/s or Gb/s.

[-actual-duration {<seconds>|[<d> days] <hh>:<mm>[:<ss>]]] - Duration of Move

If this parameter is specified, the command displays move operations that match the specified duration for which the volume move was or is in progress.

[-source-aggregate <aggregate name>] - Source Aggregate

If this parameter is specified, the command displays move operations that match the specified name of the aggregate where the volume being moved originally resides or resided.

[-source-node <nodename>] - Source Node (privilege: advanced)

If this parameter is specified, the command displays move operations that match the specified name of the node where the source aggregate is present.

[-start-time <Date>] - Start Time of Move

If this parameter is specified, the command displays move operations that match the specified date and time in the cluster time zone when the volume move operation started.

[-state {healthy|warning|alert|failed|done}] - Move State

If this parameter is specified, the command displays move operations that match the specified state of the volume move operation.

[-moved-by-autobalance {true|false}] - Move Initiated by Auto Balance Aggregate (privilege: advanced)

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

[-original-job-id <integer>] - Original Job ID (privilege: advanced)

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

[-is-source-encrypted {true|false}] - Is Source Volume Encrypted

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

[-source-key-id <text>] - Encryption Key ID of Source Volume

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

[-is-destination-encrypted {true|false}] - Is Destination Volume Encrypted

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

[-destination-key-id <text>] - Encryption Key ID of Destination Volume

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

Examples

The following example lists status of volume move operation for a volume vol2 on a Vserver vs0

```
cluster1::> volume move show -vserver vs0 -volume vol2

Vserver Name: vs0
Volume Name: vol2
Actual Completion Time: -
Bytes Remaining: 6.37GB
Destination Aggregate: cluster1_aggr2
Detailed Status: Transferring data: 3.67GB sent.
Estimated Time of Completion: Sat Jul 16 20:25:50 2011
Managing Node: node1
Percentage Complete: 36%
Move Phase: replicating
Estimated Remaining Duration: 00:01
Replication Throughput: 61.08MB/s
Duration of Move: 00:02
Source Aggregate: cluster1_aggr1
Start Time of Move: Sat Jul 16 20:22:01 2011
Move State: healthy
```

The following example lists status of volume move operation for a volume vol2 on a Vserver vs0 in advanced mode

```
cluster1::*> volume move show -vserver vs0 -volume vol2

Vserver Name: vs0
Volume Name: vol2
Actual Completion Time: -
Bytes Remaining: 156KB
Specified Action For Cutover: wait
Specified Cutover Time Window: 30
Destination Aggregate: cluster1_aggr2
Destination Node: node2
Detailed Status: Cutover Deferred, Waiting for user intervention (2.04MB Sent)::Volume move job preparing transfer.
Estimated Time of Completion: -
Job ID: 265
Managing Node: node1
Percentage Complete: -
Move Phase: cutover_hard_deferred
Prior Issues Encountered: -
Estimated Remaining Duration: -
Replication Throughput: -
Duration of Move: 00:24:59
Source Aggregate: cluster1_aggr1
Source Node: node1
Start Time of Move: Tue Mar 17 22:31:32 2011
Move State: alert
Move Initiated by Auto Balance Aggregate: false
Original Job ID: -
```

The following example lists status of volume move operation for a volume vol2 on a Vserver vs0 in diagnostic mode

```
cluster1::*> volume move show -vserver vs0 -volume vol2

Vserver Name: vs0
```

```

        Volume Name: vol2
        Volume Instance UUID: f9850e48-0c52-4884-ae9a-cfff7de13b57
        Actual Completion Time: -
        Bytes Remaining: 6.37GB
        Bytes Sent: 3.67GB
        Status Code: -
        Completion String: -
        Specified Action For Cutover: defer_on_failure
        Specified Cutover Attempts: 3
        Specified Cutover Time Window: 30
        Time User Triggered Cutover: -
        Time Move Job Last Entered Cutover: -
        Cutovers Attempted: 0
        Times Cutover Hard Deferred: 0
        Times Cutover Soft Deferred: 0
        Destination Aggregate: cluster1_aggr2
        Destination Node: node2
        Detailed Status: Transferring data: 3.67GB sent.
        Estimated Time of Completion: Sat Jul 16 20:25:50 2011
        Internal Progress of Move: Transferring data: 3.67GB sent.

vs0       vol1     failed  failed
3 entries were displayed.

```

volume move start

Start moving a volume from one aggregate to another aggregate

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `volume move start` command moves a flexible volume from one storage aggregate to another. The destination aggregate can be located on the same node as the original aggregate or on a different node. The move occurs within the context of the same Vserver.

Parameters

-vserver <*vserver name*> - Vserver Name

This specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This specifies the volume that will be moved.

-destination-aggregate <aggregate name> - Destination Aggregate

This specifies the aggregate to which the volume will be moved.

[-cutover-window <integer>] - Cutover time window in seconds (privilege: advanced)

This specifies the time interval to completely cutover operations from the original volume to the moved volume. The default value is 30 seconds. The range for valid input is from 30 to 300 seconds, inclusive.

[-cutover-action {abort_on_failure|defer_on_failure|force|wait|retry_on_failure}] - Action for Cutover (privilege: advanced)

Specifies the action to be taken for cutover. If the effective cluster version is Data ONTAP 8.3 and later, the default is *retry_on_failure*; otherwise the default is *defer_on_failure*. If the *abort_on_failure* action is specified, the job tries to cutover until cutover attempts are exhausted. If it fails to cutover, it cleans up and ends the operation. If the *defer_on_failure* action is specified, the job tries to cutover until the cutover attempts are exhausted. If it fails to cutover, it moves into the "cutover deferred" state. The volume move job waits to issue a ["volume move trigger-cutover" on page 1439](#) command to restart the cutover process. If the *force* action is specified, the job tries to cutover until the cutover attempts are exhausted and forces the cutover at the expense of disrupting the clients. If the *wait* action is specified, when the job hits the decision point, it does not go into cutover automatically, instead it waits to issue a ["volume move trigger-cutover" on page 1439](#) command as the signal to try the cutover. Once cutover is manually triggered, the cutover action changes to *defer_on_failure*. If the *retry_on_failure* action is specified, the job retries to cutover indefinitely and it never enters a "hard-deferred" state. After exhausting cutover attempts, the move job waits one hour before trying to cutover again. Issue a ["volume move trigger-cutover" on page 1439](#) command at any time to restart the cutover process.

[-perform-validation-only [true]] - Performs validation checks only

This is a boolean option allowing to perform pre-move validation checks for the intended volume. When set to *true*, the command only performs the checks without creating a move job. The default value is *false*.

[-foreground {true|false}] - Foreground Process

This specifies whether the volume move operation runs as a foreground process. The default setting is *false* (that is, the operation runs in the background). Note that using this parameter will not affect how long it takes for the operation to complete.

[-encrypt-destination {true|false}] - Encrypt Destination Volume

This specifies whether the move operation should result in creating an encrypted volume on the destination aggregate. When this option is set to *true*, the destination volume will be encrypted. When it is set to *false*, the destination volume will be a plain-text volume. When this parameter is not specified, then destination will be same as the source type.

[-generate-destination-key {true|false}] - Generate New Encryption Key for Destination Volume

This option is specified along with *-encrypt-destination*, a new key will be generated, and that new key will be used for encrypting the destination volume.

[-tiering-policy {snapshot-only|auto|none|backup}] - Volume Tiering Policy

This optional parameter specifies the tiering policy to apply to the destination volume. Tiering policies decide whether the user data blocks of a volume in a FabricPool will be tiered to the capacity tier when they become cold. FabricPool combines flash (performance tier) with an object store (external capacity tier) into a single aggregate. Temperature of a volume block increases if it is accessed frequently and decreases when it is not.

The available tiering-policies are:

- *snapshot-only* - This policy allows tiering of only the volume Snapshot copies not associated with the active file system.

- **auto** - This policy allows tiering of both snapshot and active file system user data to the capacity tier.
- **none** - Volume blocks will not be tiered to the capacity tier.
- **backup** - This policy transfers all user data blocks directly to the capacity tier. In the case of DP volumes, the tiering policy is retained as backup after the move. For non-DP volumes, the policy is switched back to snapshot-only.

Examples

The following examples perform a validation-check for a volume named `volume_test` on a Vserver named `vs0` to determine if it can be moved to a destination-aggregate named `dest_aggr`.

```
cluster1::> volume move start -vserver vs0 -volume volume_test -destination-aggregate dest_aggr -perform-validation-only true
Error: command failed: There is 2.54GB of available space on the aggregate
      dest_aggr which is not enough to accommodate a volume.
```

```
cluster1::> volume move start -vserver vs0 -volume volume_test -destination-aggregate dest_aggr -perform-validation-only true
Validation succeeded.
```

The following example performs a volume move start operation to move a volume named `volume_test` on a Vserver name `vs0` to a destination-aggregate named `dest_aggr`.

```
cluster1::> volume move start -vserver vs0 -volume volume_test -destination-aggregate dest_aggr
[Job 267] Job is queued: Move "volume_test" in Vserver "vs0" to aggregate "dest_aggr".
          Use the "volume move show -vserver vs0 -volume volume_test" command to view the status of this operation.
```

The following example performs a volume move start operation to move a plain-text volume named `vol1` to an encrypted volume on destination-aggregate `aggr1`.

```
cluster1::> volume move start -volume vol1 -destination-aggregate aggr1 -encrypt-destination true
[Job 267] Job is queued: Move "vol1" in Vserver "vs1" to aggregate "aggr1".
          Use the "volume move show -vserver vs1 -volume vol1" command to view the status of this operation.
```

volume move trigger-cutover

Trigger cutover of a move job

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command causes a replicating or deferred volume move job to attempt cutover. Unless the `force` option is set, cutover entry is not guaranteed.

Parameters

-vserver <vserver name> - Vserver Name

The Vserver on which the volume is located.

-volume <volume name> - Volume Name

The volume that is being moved.

[-force [true]] - Force Cutover

If this parameter is specified, the cutover is done without confirming the operation - even if the operation could cause client I/O disruptions.

Examples

volume move recommend commands

The recommend directory

volume move recommend show

Display Move Recommendations

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `volume move recommend show` command displays moves that were recommended by the Auto Balance Aggregate feature.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| **[-instance]]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

If this parameter is specified, the display will be limited to only those recommendations with a Vserver that matches the specified value.

[-volume <volume name>] - Volume Name

If this parameter is specified, the display will be limited to only those recommendations with a volume that matches the specified value.

[-creation-time <MM/DD/YYYY HH:MM:SS>] - Time Stamp of Recommendation

If this parameter is specified, the display will be limited to only those recommendations with a creation-time that matches the specified value.

[-source-aggregate <aggregate name>] - Unbalanced Aggregate Name

If this parameter is specified, the display will be limited to only those recommendations with a source-aggregate that matches the specified value.

[-source-space-after <percent>] - Space Free After Move (%)

If this parameter is specified, the display will be limited to only those recommendations with a source-space-after that matches the specified value.

[-destination-aggregate <aggregate name>] - Destination Aggregate Name

If this parameter is specified, the display will be limited to only those recommendations with a destination-aggregate that matches the specified value.

[-destination-space-after <percent>] - Space Bump After Move (%)

If this parameter is specified, the display will be limited to only those recommendations with a destination-space-after that matches the specified value.

Examples

The following example displays information about the recommendations made by the Auto Balance Aggregate feature.

```
cluster1::*> volume move recommend show -instance
Vserver Name: vs0.example.com
Volume Name: ro10
```

Time Stamp of Recommendation: 3/13/2014 16:26:39
Unbalanced Aggregate Name: aggr_1
Space Free After Move (%): 36%
Destination Aggregate Name: aggr_3
Space Bump After Move (%): 36%

volume move target-aggr commands

Manage target aggregates for volume move

The `volume move target-aggr` command enables you to list the aggregates where a volume could be moved.

volume move target-aggr show

List target aggregates compatible for volume move

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `volume move target-aggr show` displays information about compatible target aggregates for the specified volume to be moved to.

Parameters

[`-fields <fieldname>, ...`]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-vserver <vserver name>`] - Vserver Name (Required field)

Selects information about compatible target aggregates for volumes of the specified Vserver.

[`-volume <volume name>`] - Volume Name (Required field)

Selects information about compatible target aggregates that have enough space for the specified volume.

[`-aggregate <aggregate name>`] - Aggregate Name

Selects information about compatible target aggregates with the specified aggregate name (to which the volume might be moved).

[`-tiering-policy {snapshot-only|auto|none|backup}`] - Volume Tiering Policy

Selects information about compatible target aggregates with the specified destination tiering policy.

[`-availsize {<integer>[KB|MB|GB|TB|PB]}`] - Available size

Selects information about compatible target aggregates that have the specified available size.

[`-storagetype <text>`] - Storage Type

Selects information about compatible target aggregates with the specified storage type. Examples of storage types are “ATA”, “BSAS”, “FCAL”, “LUN”, “SATA”, “SAS” and “SSD”.

Examples

The following example lists target aggregates compatible for moving a volume `vol1` on a Vserver `vs1`.

```
cluster1::> volume move target-aggr show -vserver vs1 -volume vol1
Aggregate Name  Available Size  Storage Type
-----
aggr1          113.5GB       FCAL
aggr2          113.5GB       FCAL
2 entries were displayed.
```

volume qtree commands

Manage qtrees

volume qtree create

Create a new qtree

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command creates a qtree in the Vserver and volume you specify. You can create up to 4,994 qtrees per volume. This command is not supported on Infinite Volumes.

You can optionally specify the following attributes when creating a new qtree:

- Security style
- Opportunistic lock mode
- UNIX permissions
- Export Policy

Parameters

-vserver <vserver name> - Vserver Name

This specifies the name of the Vserver on which the volume containing the qtree belongs.

{ -volume <volume name> - Volume Name

This specifies the name of the volume that will contain the qtree you are creating.

-qtree <qtree name> - Qtree Name

This specifies the name of the qtree you are creating.

A qtree name cannot contain a forward slash (/). The qtree name cannot be more than 64 characters long.

| -qtree-path <qtree path> } - Actual (Non-Junction) Qtree Path

The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments.

[-security-style <security style>] - Security Style

This optionally specifies the security style for the qtree, which determines how access to the qtree is controlled. The supported values are *unix* (for UNIX uid, gid and mode bits), *ntfs* (for CIFS ACLs), and *mixed* (for NFS and CIFS access). The *unified* security style, which applies only to Infinite Volumes, cannot be applied to a qtree. If you do not specify a security style for the qtree, it inherits the security style of its containing volume.

[-oplock-mode {enable|disable}] - Oplock Mode

This optionally specifies whether oplocks are enabled for the qtree. If you do not specify a value for this parameter, it inherits the oplock mode of its containing volume.

[-unix-permissions | -m <unix perm>] - Unix Permissions

This optionally specifies the UNIX permissions for the qtree when the *-security-style* is set to *unix* or *mixed*. You can specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX *ls* command (for example, *-rwxr-x---*). For information on UNIX permissions, see the UNIX or Linux documentation. If you do not specify UNIX permissions for the qtree, it inherits the UNIX permissions of its containing volume.

[-export-policy <text>] - Export Policy

This optional parameter specifies the name of the export policy associated with the qtree. For information on export policies, see the documentation for the [“vserver export-policy create” on page 1665](#) command. If you do not specify a value for this parameter, it inherits the export policy of its containing volume.

Examples

The following example creates a qtree named qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1. The qtree has a mixed security style. Its other attributes are inherited from volume vol1.

```
cluster1::> volume qtree create -vserver vs0 -volume vol1 -qtree qtree1 -security-style mixed
```

The following example uses a 7G-compatible command to create the qtree.

```
cluster1::> vserver context vs0
vs0::> qtree create /vol/vol1/qtree1
```

volume qtree delete

Delete a qtree

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command deletes a qtree. The length of time that it takes to delete a qtree depends on the number of directories and files it contains. You can monitor the progress of the delete operation by using the [“job show” on page 160](#) and [“job watch-progress” on page 168](#) commands, respectively. This command is not supported on Infinite Volumes.

The automatically created qtree in the volume - qtree0, listed in CLI output as "" - cannot be deleted.

Note: Quota rules associated with this qtree in all the quota policies will be deleted when you delete this qtree. Qtree deletion will not be allowed if Storage-level Access Guard (SLAG) is configured.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the name of the Vserver on which the volume containing the qtree belongs.

{ -volume <volume name> - Volume Name

This specifies the name of the volume containing the qtree to be deleted.

-qtree <qtree name> - Qtree Name

This specifies the name of the qtree to be deleted.

| -qtree-path <qtree path> - Actual (Non-Junction) Qtree Path

The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments.

[-force [true]] - Force Delete (privilege: advanced)

This optionally forces the qtree delete operation to proceed when the qtree contains files. The default setting is false (that is, the qtree will not be deleted if it contains files). This parameter is available only at the advanced privilege and higher.

[-foreground [true]] - Foreground Process

This optionally specifies whether the qtree delete operation runs as a foreground process. The default setting is false (that is, the operation runs in the background).

Examples

The following example deletes a qtree named qtree4. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1:: volume qtree delete -vserver vs0 -volume vol1 -qtree qtree4
WARNING: Are you sure you want to delete qtree qtree4 in volume vol1 vserver vs0? [y|n]: y
[Job 38] Job is queued: Delete qtree qtree4 in volume vol1 vserver vs0.
```

volume qtree modify

Modify qtree attributes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command allows you to modify the following attributes of an existing qtree in the given Vserver and volume:

- Security style
- Opportunistic lock mode
- UNIX permissions
- Export policy

This command is not supported by Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the name of the Vserver on which the volume containing the qtree belongs.

{ -volume <volume name> - Volume Name

This specifies the name of the volume containing the qtree to be modified.

-qtree <qtree name> - Qtree Name

This specifies the name of the qtree to be modified. You can modify the attributes of qtree0 (represented as "" in the CLI) by omitting the -qtree parameter from the command or by specifying the value "" for the -qtree parameter.

| -qtree-path <qtree path> } - Actual (Non-Junction) Qtree Path

The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented as /vol/<volume name>.

[-security-style <security style>] - Security Style

This optionally modifies the security style for the qtree. The supported values are *unix* (for UNIX uid, gid and mode bits), *ntfs* (for CIFS ACLs), and *mixed* (for NFS and CIFS access). The *unified* security style, which applies only to Infinite Volumes, cannot be applied to a qtree. Modifying a qtree's security style will not affect any of the files in the other qtrees of this volume.

[-oplock-mode {enable|disable}] - Oplock Mode

This optionally modifies whether oplocks are enabled for the qtree.

Modifying qtree0's oplock mode will not affect any of the files in the other qtrees of this volume.

[-unix-permissions <unix perm>] - Unix Permissions

This optionally modifies the UNIX permissions for the qtree. You can specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX ls command (for example, -rwxr-x---). For information on UNIX permissions, see the UNIX or Linux documentation.

The unix permissions can be modified only for qtrees with unix or mixed security style.

[-export-policy <text>] - Export Policy

This optional parameter modifies the export policy associated with the qtree. If you do not specify an export policy name, the qtree inherits the export policy of the containing volume. For information on export policy, see the documentation for the [“vserver export-policy create” on page 1665](#) command.

Examples

The following example modifies a qtree named qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1. The qtree now has a UNIX security style and oplocks are enabled.

```
cluster1::> volume qtree modify -vserver vs0 -volume vol1 -qtree qtree1 -security-style unix -oplocks enabled
```

volume qtree oplocks

Modify qtree oplock mode

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command allows you to display or modify the opportunistic lock mode of a qtree. This command is not supported on Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the name of the Vserver on which the volume containing the qtree belongs.

{ -volume <volume name> - Volume Name

This specifies the name of the volume containing the qtree.

-qtree <qtree name> - Qtree Name

This specifies the name of the qtree for which the oplock mode is being displayed or modified.

| -qtree-path <qtree path> - Actual (Non-Junction) Qtree Path

The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented as /vol/<volume name>.

[-oplock-mode {enable|disable}] - Oplock Mode

This specifies the new oplock mode of the qtree. If this parameter is not specified, then the current oplock mode of the qtree is displayed.

Modifying qtree0's oplock mode will not affect any of the files in the other qtrees of this volume.

Examples

The following example displays the oplock mode of a qtree called qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree oplocks -vserver vs0 -volume vol1 -qtree qtree1
/vol/vol1/qtree1 has mixed security style and oplocks are disabled.
```

The following example modifies the oplock mode of a qtree called qtree2 to enabled. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree oplocks -vserver vs0 -volume vol1 -qtree qtree2 -oplock-mode enable
```

The following example uses a 7G-compatible command to display and modify the oplock mode of a qtree.

```
cluster1::> vserver context vs0
vs0::> qtree oplocks /vol/vol1/qtree1
/vol/vol1/qtree1 has mixed security style and oplocks are disabled.
vs0::> qtree oplocks /vol/vol1/qtree2 enable
```

volume qtree rename

Rename an existing qtree

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command allows you to rename an existing qtree. This command is not supported on Infinite Volumes.

The automatically created qtree in the volume - qtree0, listed in CLI output as "" - cannot be renamed.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the name of the Vserver on which the volume containing the qtree belongs.

{ -volume <volume name> - Volume Name

This specifies the name of the volume containing the qtree to be renamed.

-qtree <qtree name> - Qtree Name

This specifies the name of the qtree to be renamed.

| -qtree-path <qtree path> - Actual (Non-Junction) Qtree Path

The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments.

-newname <qtree name> - Qtree New Name

This specifies the new name of the qtree. The new qtree name cannot contain a forward slash (/) and cannot be more than 64 characters long.

Examples

The following example renames a qtree named qtree3 to qtree4. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree rename -vserver vs0 -volume vol1 -qtree qtree3 -newname qtree4
```

volume qtree security

Modify qtree security style

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command allows you to display or modify the security style of a qtree. This command is not supported on Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the name of the Vserver on which the volume containing the qtree belongs.

{ -volume <volume name> - Volume Name

This specifies the name of the volume containing the qtree.

-qtree <qtree name> - Qtree Name

This specifies the name of the qtree for which the security style is being displayed or modified.

| -qtree-path <qtree path> - Actual (Non-Junction) Qtree Path

The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented as /vol/<volume name>.

[-security-style <security style>] - Security Style

This specifies the new security style of the qtree. If this parameter is not specified, then the current security style of the qtree is displayed. The supported values are *unix* (for UNIX uid, gid and mode bits), *ntfs* (for CIFS ACLs), and *mixed* (for NFS and CIFS access). The *unified* security style, which applies only to Infinite Volumes, cannot be applied to a qtree. Modifying a qtree's security style will not affect any of the files in the other qtrees of this volume.

Examples

The following example displays the security style of a qtree called qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree security -vserver vs0 -volume vol1 -qtree qtree1
/vol/vol1/qtree1 has mixed security style and oplocks are disabled.
```

The following example modifies the security style of a qtree called qtree2 to unix. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree security -vserver vs0 -volume vol1 -qtree qtree2 -security-style unix
```

The following example uses a 7G-compatible command to display and modify the security style of a qtree.

```
cluster1::> vserver context vs0
vs0::> qtree security /vol/vol1/qtree1
/vol/vol1/qtree1 has mixed security style and oplocks are disabled.
vs0::> qtree security /vol/vol1/qtree2 unix
```

volume qtree show

Display a list of qtrees

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays information about qtrees for online volumes. By default, the command displays the following information about all qtrees in the cluster:

- Vserver name
- Volume name
- Qtree name
- Security style (unix, ntfs, mixed or unified)
- Whether oplocks is enabled
- Status (normal or readonly)

The display will also include information about Qtree 0. When you create a volume, a special qtree referred to as "qtree0", also called the default qtree is automatically created for the volume. It represents all of the data stored in a volume that is not contained in a qtree. In the CLI output, qtree0 is denoted by empty quotation marks ("") and has the ID zero (0). The qtree called qtree0 cannot be manually created or deleted. This command is not supported on Infinite Volumes.

The qtree status indicates readonly for data protection and load sharing volumes.

To display detailed information about a single qtree, run the command with the *-instance* and *-qtree* parameters. The detailed view adds the following information:

- UNIX permissions
- Qtree ID
- Export policy
- Is Export Policy Inherited

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-exports]

Displays the following information about qtree exports:

- Vserver - The name of the Vserver the qtree belongs to
- Volume - The name of the volume the qtree resides on
- Qtree name - The name of the qtree
- Policy Name - The name of the export policy assigned to the qtree
- Is Export Policy Inherited - Whether the export policy assigned to the qtree is inherited

| [-id]

Displays qtree IDs in addition to the default output.

| [-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

Selects information about the qtrees in the specified Vserver.

{ [-volume <volume name>] - Volume Name

Selects information about the qtrees in the specified volume.

[-qtree <qtree name>] - Qtree Name

Selects information about the qtrees that have the specified name.

| [-qtree-path <qtree path>]] - Actual (Non-Junction) Qtree Path

Selects information about the qtrees that have the specified path.

[-security-style <security style>] - Security Style

Selects information about the qtrees that have the specified security style. The *unified* security style, which applies only to Infinite Volumes, cannot be applied to a qtree.

[-oplock-mode {enable|disable}] - Oplock Mode

Selects information about the qtrees that have the specified oplock mode.

[-unix-permissions | -m <unix perm>] - Unix Permissions

Selects information about the qtrees that have the specified UNIX permissions.

[-qtree-id <integer>] - Qtree Id

Selects information about the qtrees that have the specified ID. A valid qtree ID is an integer from 0 to 4994. All qtree0 (automatically created) qtrees have an ID of zero (0).

[-status {normal|readonly}] - Qtree Status

Selects information about the qtrees that have the specified status.

[-export-policy <text>] - Export Policy

Selects information about the qtrees that use the specified export policy.

[-is-export-policy-inherited {true|false}] - Is Export Policy Inherited

Selects information about the qtrees that inherit (true) or not inherit (false) the export policy of containing volume.

Examples

The following example displays default information about all qtrees along with each qtree ID. Note that on vs0, no qtrees have been manually created, so only the automatically created qtrees referred to as qtree 0

are shown. On vs1, the volume named vs1_vol1 contains qtree 0 and two manually created qtrees, qtree1 and qtree2.

```
cluster1::> volume qtree show -id
Vserver      Volume      Qtree      Style      Oplocks      Status      Id
-----
vs0          vs0_vol1    ""          unix        enable        readonly    0
vs0          vs0_vol2    ""          unix        enable        normal      0
vs0          vs0_vol3    ""          unix        enable        readonly    0
vs0          vs0_vol4    ""          unix        enable        readonly    0
vs0          root_vs_vs0 ""          unix        enable        normal      0
vs1          vs1_vol1    ""          unix        enable        normal      0
vs1          vs1_vol1    qtree1      unix        disable       normal      1
vs1          vs1_vol1    qtree2      unix        enable        normal      2
vs1          root_vs_vs1 ""          unix        enable        normal      0
9 entries were displayed.
```

volume qtree statistics

Display qtree statistics

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays NFS and CIFS operations statistics for qtrees. Note that qtree statistics are available only when the volume containing the qtree is online. This command is not supported on Infinite Volumes.

Statistics are cumulative values from the time the volume is brought online or when the statistics have been reset by using the " [volume qtree statistics-reset](#)" on [page 1450](#)" command.

The command output depends on the parameters specified with the command. If no parameters are specified, the command displays the following statistics information about all qtrees:

- Vserver name
- Volume name
- Qtree name
- NFS operations
- CIFS operations

Note: Qtree statistics are not persistent. If you restart a node, if a storage takeover and giveback occurs, or if the containing volume is set to offline and then online, qtree statistics are set to zero.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

| **[-internal] (privilege: advanced)**

If this parameter is specified, the output will also include the internal operation statistics. Internal operation is any operation on the qtree that originated within Data ONTAP software.

| **[-no-reset] (privilege: advanced)**

If this parameter is specified, the output will display the NFS and CIFS op statistics since the time the volume was online.

| **[-no-reset-internal] (privilege: advanced)**

If this parameter is specified, the output will also include the internal op statistics since the time the volume was online.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-vserver <vserver name>`] - Vserver Name

If this parameter is specified, the command displays information about the qtrees on the specified Vserver.

{ [`-volume <volume name>`] - Volume Name

If this parameter is specified, the command displays information about the qtrees on the specified volume.

[`-qtree <qtree name>`] - Qtree Name

If this parameter is specified, the command displays information about the specified qtree.

[`-qtree-path <qtree path>`] - Actual (Non-Junction) Qtree Path

The qtree path argument in the format `/vol/<volume name>/<qtree name>` can be specified instead of specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented as `/vol/<volume name>`.

[`-nfs-ops <Counter64>`] - NFS operations since reset

If this parameter is specified, the command displays information about qtrees that have the corresponding cumulative number of NFS operations since the statistics was zeroed.

[`-cifs-ops <Counter64>`] - CIFS operations since reset

If this parameter is specified, the command displays information about qtrees that have the corresponding cumulative number of CIFS operations since the statistics was zeroed.

[`-internal-ops <Counter64>`] - Internal operations since reset (privilege: advanced)

If this parameter is specified, the command displays information about qtrees that have the corresponding cumulative number of internal operations since the statistics was zeroed.

[`-no-reset-nfs-ops <Counter64>`] - NFS operations since online (privilege: advanced)

If this parameter is specified, the command displays information about qtrees that have the corresponding cumulative number of NFS operations since the volume was online.

[`-no-reset-cifs-ops <Counter64>`] - CIFS operations since online (privilege: advanced)

If this parameter is specified, the command displays information about qtrees that have the corresponding cumulative number of CIFS operations since the volume was online.

[`-no-reset-internal-ops <Counter64>`] - Internal operations since online (privilege: advanced)

If this parameter is specified, the command displays information about qtrees that have the corresponding cumulative number of internal operations since the volume was online.

Examples

The following example displays statistics information for all qtrees on the Vserver named vs0.

```
cluster1::> volume qtree statistics -vserver vs0
Vserver   Volume   Qtree      NFS Ops    CIFS Ops
-----
vs0       vol0     qtree1     10876      2678
vs0       vol1     qtree1a    16543      0
vs0       vol2     qtree2     0          0
vs0       vol2     qtree2a    0          0
```

4 entries were displayed.

The following example displays statistics information for qtrees on Vserver vs0 that have NFS ops more than 15000.

```
cluster1::> volume qtree statistics -vserver vs0 -nfs-ops >15000
Vserver   Volume   Qtree      NFS Ops    CIFS Ops
-----
vs0       vol1     qtree1a    16543      0
```

volume qtree statistics-reset

Reset qtree statistics in a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command resets qtree statistics for all qtrees in a volume. This command is not supported on Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the name of the Vserver on which the volume containing the qtree belongs.

-volume <volume name> - Volume Name

This specifies the name of the volume containing the qtrees whose statistics you want to reset.

Examples

The following example resets statistics for all qtrees on the volume named vol1 on the Vserver named vs0.

```
cluster1::> volume qtree statistics-reset -vserver vs0 -volume vol1
```

volume quota commands

Manage Quotas, Policies, Rules and Reports

volume quota modify

Modify quota state for volumes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command allows you to modify the following quota attributes for one or more volumes:

- Quota state
- Whether quota exceeded messages are logged or not
- Frequency with which quota exceeded messages are logged

Modifications to the quota state for a volume creates a job to perform the quota state changes for that volume. You can monitor the progress of the job by using the [“job show” on page 160](#) and [“job watch-progress” on page 168](#) commands. This command is not supported on Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the name of the Vserver on which the volume whose quota attributes you are modifying is located.

-volume <volume name> - Volume Name

This specifies the name of the volume whose quota attributes you are modifying.

[-state <quota_state>] - Quota State

This parameter optionally modifies the quota state to one of the following:

- `off` - This indicates that quotas be deactivated for the specified volume.
- `on` - This indicates that quotas be activated for the specified volume.
- `resize` - This indicates that the quota limits be resized according to the values specified in the quota policy assigned to the Vserver. Note that quotas must be activated first for a volume before a resize operation can be performed.

Both quota activation and quota resize operations apply the quota rules configured for the volume within the quota policy that is currently assigned to the Vserver. These quota rules are managed by using the commands in the [“volume quota policy rule” on page 1467](#) menu. Quotas, when activated for a volume, go through an initialization process. As part of the quota initialization all the quota rules are applied to the volume. In addition, a filesystem scanner is started to scan the entire filesystem within the volume to bring the quota accounting and reporting up to date. The quota job finishes after the filesystem scanner is started on the volume. The quota state for the volume is initializing until the filesystem scanner finishes scanning the entire filesystem. After the scanning is complete, the quota state will be `on`.

When quotas are resized, the quota state is `resizing` until the resizing operation finishes. As part of this operation, the quota limits for quotas currently in effect are resized to the limits currently configured for the volume. After the quota resize operation finishes, the quota state will be `on`.

Quota state changes can also be performed using the commands [“volume quota on” on page 1453](#), [“volume quota off” on page 1453](#) and [“volume quota resize” on page 1459](#).

`[-logging {on|off}] - Logging Messages`

This parameter optionally specifies whether quota exceeded syslog/EMS messages are logged in the system log messages. When it is set to `on`, quota exceeded messages are generated when the user exceeds the quota's disk limit or the file limit through a NFS/CIFS operation or any operation within the Data ONTAP software. When set to `off` no quota exceeded messages are generated. This parameter can be changed only after quotas are activated for a volume.

`[-logging-interval <text>] - Logging Interval`

This parameter optionally specifies a logging interval, which indicates the frequency with which quota exceeded messages are generated. You can specify a logging interval in the `<integer><suffix>` format, where suffix can be minutes (`m`), hours (`h`), or days (`d`), but not combinations thereof (in other words, `90m` is a valid logging interval, but `1h30m` is not a valid logging interval). You can modify the logging interval only when the logging is `on`. When quotas are first activated, the logging parameter is automatically set to `on`, and the logging interval set to `1h`. If continuous logging is required, an interval of `0m` should be specified. This parameter can be changed only after quotas are activated for a volume.

Note: quota message logging may not occur at exactly the same interval rate as specified by the user, especially for very small intervals. This is due to the behavior of the logging system that buffers messages instead of outputting them immediately. Setting the logging interval to `0m` can cause lots of quota exceeded messages to be logged in the system log messages.

`[-foreground [true]] - Foreground Process`

This parameter optionally specifies whether the job created by quota state modify operation runs as a foreground process. The default setting is `false` (that is, the quota state modify operation runs in the background). When set to `true`, the command will not return until the job completes.

Examples

The following example activates quotas on the volume named `vol1`, which exists on Vserver `vs0`.

```
cluster1::> volume quota modify -vsriver vs0 -volume vol1 -state on
[Job 24] Job is queued: Quota ON Operation on vsriver vs0 volume vol1.
```

The following example turns on quota message logging and sets the logging interval to 4 hours.

```
cluster1::> volume quota modify -vsriver vs0 -volume vol1 -logging on -logging-interval 4h
```

The following example resizes quota limits on a volume.

```
cluster1::> volume quota modify -vsriver vs0 -volume vol1 -state resize -foreground true
```

[Job 80] Job succeeded: Successful

volume quota off

Turn off quotas for volumes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command creates a job to deactivate quotas for the specified volume. This command is not supported on Infinite Volumes. You can monitor the progress of the job by using the [“job show” on page 160](#) and [“job watch-progress” on page 168](#) commands.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the name of the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This specifies the name of the volume on which you are deactivating quotas.

[-foreground [true]] - Foreground Process

This optionally specifies whether the job created for deactivating quotas runs as a foreground process. The default setting is *false* (that is, the operation runs in the background). When set to *true*, the command will not return until the job completes.

Examples

The following example deactivates quotas on the volume named *vol1*, which exists on Vserver *vs0*.

```
cluster1::> volume quota off -vserver vs0 -volume vol1
[Job 23] Job is queued: Quota OFF Operation on vs0 volume vol1.
```

The following example uses a 7G-compatible command to deactivate quotas on the volume named *vol1* which exists on Vserver *vs0*.

```
cluster1::> vs0 context vs0
vs0::> quota off vol1
[Job 25] Job is queued: Quota OFF Operation on vs0 volume vol1.
```

volume quota on

Turn on quotas for volumes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command creates a job to activate quotas for the specified volume. This command is not supported on Infinite Volumes. You can monitor the progress of the job by using the [“job show” on page 160](#) and [“job watch-progress” on page 168](#) commands.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the name of the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This specifies the name of the volume on which you are activating quotas.

[-foreground | -w *[true]*] - Foreground Process

This optionally specifies whether the job created for activating quotas runs as a foreground process. The default setting is `false` (that is, the operation runs in the background). When set to `true`, the command will not return until the job completes. The quota job finishes after the filesystem scanner is started. The quota state for the volume is `initializing` until the filesystem scanner finishes scanning the entire filesystem. After the scanning is complete, the quota state will be `on`.

Examples

The following example activates quotas on the volume named `vol1`, which exists on Vserver `vs0`.

```
cluster1::> volume quota on -vserver vs0 -volume vol1
[Job 23] Job is queued: Quota ON Operation on vs0 volume vol1.
```

The following example uses a 7G-compatible command to activate quotas on the volume named `vol1` which exists on Vserver `vs0`.

```
cluster1::> vs0 context vs0
vs0::> quota on -w vol1
[Job 25] Job is queued: Quota ON Operation on vs0 volume vol1.

[Job 25] Job succeeded: Successful
```

volume quota report

Display the quota report for volumes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the quota report for all volumes in each Vserver that are online and for which quotas are activated. Quota report includes the quota rules (default, explicit, and derived) in effect and the associated resource usage (disk space and files). If quotas are still initializing for a specific volume, that volume is not included. This command is not supported on Infinite Volumes.

This command displays the following information:

- Vserver name
- Volume name
- Index - This is a unique number within a volume assigned to each quota rule displayed in the quota report.
- Tree name - This field gives the name of the qtree if the quota rule is at the qtree level. It is empty if the quota rule is at the volume level.
- Quota type - Type of quota rule (tree or user or group).
- Quota target - This field gives the name of the target of the quota rule. For tree quota rules, it will be the qtree ID of the qtree. For user quota rules, it will be the UNIX user name or the Windows user name. For group quota rules, it will be the UNIX group name. For default rules (tree or user or group), this will display `"*"`. If the UNIX user identifier, UNIX group identifier, or Windows security identifier no longer exists or if the identifier-to-name conversion fails, the target appears in numeric form.
- Quota target ID - This field gives the target of the quota rule in numeric form. For tree quota rules, it will be the qtree ID of the qtree. For group quota rules, it will be the UNIX group identifier. For UNIX user quota rules, it will be the UNIX user identifier. For Windows user quota rules, it will be the Windows security identifier in its native format. For default rules (tree or user or group), `"*"` will be displayed.

- Disk space used - For a default quota, the value is 0.
- Disk space limit
- Soft disk space limit
- Threshold for disk space limit
- Files used - For a default quota, the value is 0.
- File limit
- Soft file limit
- Quota specifier - For an explicit quota, this field shows how the quota target was configured by the administrator using the volume quota policy rule command. For a default quota, the field shows "*". For a derived tree quota, this field shows the qtree path. For a derived user and group quota, the field is either blank or "*".

The following parameters: `-soft`, `-soft-limit-thresholds`, `-target-id`, `-thresholds`, `-fields` and `-instance` display different set of fields listed above. For example, `-soft` will display the soft disk space limit and soft file limit apart from other information. Similarly `-target-id` will display the target in the numeric form.

A quota report is a resource intensive operation. If you run it on many volumes in the cluster, it might take a long time to complete. A more efficient way would be to view the quota report for a particular volume in a Vserver.

Depending upon the quota rules configured for a volume, the quota report for a single volume can be large. If you want to monitor the quota report entry for a particular tree/user/group repeatedly, find the index of that quota report entry and use the `-index` field to view only that quota report entry. See the examples section for an illustration.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| **[-soft]**

If this parameter is specified, the command display will include the soft disk space limit and the soft file limit.

| **[-soft-limit-thresholds]**

If this parameter is specified, the command display will include the soft disk space limit, threshold for disk space limit and soft file limit.

| **[-target-id]**

If this parameter is specified, the command will display the target of a user or group quota rule in numeric form.

| **[-thresholds]**

If this parameter is specified, the command display will include the threshold for disk space limit.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

If this parameter is specified, the command displays the quota report for volumes in the specified Vserver.

[-volume <volume name>] - Volume Name

If this parameter is specified, the command displays the quota report for the specified volume.

[-index <integer>] - Index

If this parameter is specified, the command displays the quota report for the quota rules that have the specified index.

[-tree <qtrees name>] - Qtrees Name

If this parameter is specified, the command displays the quota report for the quota rules that have the specified qtrees name.

[-quota-type <text>] - Quota Type

If this parameter is specified, the command displays the quota report for the quota rules of the given type.

[-quota-target <text>, ...] - Quota Target

If this parameter is specified, the command displays the quota report for the quota rules that have the specified quota target.

[-quota-target-id <text>, ...] - Quota Target ID

If this parameter is specified, the command displays the quota report for the quota rules that have the specified quota target identifier.

[-disk-used {<integer>[KB|MB|GB|TB|PB]] - Disk Space Used

If this parameter is specified, the command displays the quota report for the quota rules that have the specified disk space used value.

[-disk-limit {<integer>[KB|MB|GB|TB|PB]] - Disk Space Limit

If this parameter is specified, the command displays the quota report for the quota rules that have the specified disk space limit.

[-files-used <integer>] - Files Used

If this parameter is specified, the command displays the quota report for the quota rules that have the specified files used value.

[-file-limit <integer>] - Files Limit

If this parameter is specified, the command displays the quota report for the quota rules that have the specified file limit.

[-threshold {<integer>[KB|MB|GB|TB|PB]] - Disk Space Threshold

If this parameter is specified, the command displays the quota report for the quota rules that have the specified threshold for disk space limit.

[-soft-disk-limit {<integer>[KB|MB|GB|TB|PB]] - Soft Disk Space Limit

If this parameter is specified, the command displays the quota report for the quota rules that have the specified soft disk space limit.

[-soft-file-limit <integer>] - Soft Files Limit

If this parameter is specified, the command displays the quota report for the quota rules that have the specified soft file limit.

[-quota-specifier <text>] - Quota Specifier

If this parameter is specified, the command displays the quota report for the quota rules that have the specified quota specifier.

[-path <text>] - Path

If this parameter is specified, the command will display the quota report for the quota rules that are applicable for the file in the specified path. The format of the path to the file should begin with /vol/<volume name>/. The quota rules that are applicable typically consists of the tree quota rule corresponding to the qtrees in which the file resides within the volume, user quota rule at the volume and qtrees level corresponding to the UNIX user identifier or the Windows security identifier associated with the file and the group quota rule at the volume and qtrees level corresponding to the UNIX group identifier associated with the file.

[-disk-used-pct-soft-disk-limit <percent_no_limit>] - Disk Space Used % Soft Disk Space Limit

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from disk-used and soft-disk-limit.

[-disk-used-pct-threshold <percent_no_limit>] - Disk Space Used % Disk Space Threshold

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from disk-used and threshold.

[-disk-used-pct-disk-limit <percent_no_limit>] - Disk Space Used % Disk Space Limit

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from disk-used and disk-limit.

[-files-used-pct-soft-file-limit <percent_no_limit>] - Files Used % Soft File Limit

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from files-used and soft-file-limit.

[-files-used-pct-file-limit <percent_no_limit>] - Files Used % File Limit

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from files-used and file-limit.

Examples

The following example displays the quota report for all the volumes.

```
cluster1::> volume quota report
Vserver: vs0
```

Volume	Tree	Type	ID	-----Disk----- Used Limit	-----Files----- Used Limit	Quota Specifier
vol2		tree	*	0.00B 100MB	0 10000	*
vol2	vxw02	tree	3	0.00B 200MB	1 20000	vxw02
vol2		user	*	0.00B 50MB	0 -	*
vol2	vxw02	user	sam,Engr\Sammy	0.00B 100MB	0 -	sam
vol2		group	*	0.00B 500MB	0 -	*
vol2	q1	tree	1	1MB 100MB	2 10000	q1
vol2	q1	user	*	0.00B 50MB	0 -	
vol2	q1	group	*	0.00B 500MB	0 -	
vol2	q1	group	root	1MB -	2 -	
vol2	vxw01	tree	2	0.00B 100MB	1 10000	vxw01
vol2	vxw01	user	*	0.00B 50MB	0 -	
vol2	vxw01	group	*	0.00B 500MB	0 -	
vol2	vxw01	group	root	0.00B -	1 -	
vol2	vxw02	user	*	0.00B 50MB	0 -	
vol2	vxw02	group	*	0.00B 500MB	0 -	
vol2	vxw02	group	root	0.00B -	1 -	
vol2	vxw03	tree	4	0.00B 100MB	1 10000	vxw03
vol2	vxw03	user	*	0.00B 50MB	0 -	
vol2	vxw03	group	*	0.00B 500MB	0 -	
vol2	vxw03	group	root	0.00B -	1 -	
vol2		group	root	1MB -	6 -	
vol2	q1	user	root,Engr\root	0.00B -	1 -	
vol2	vxw01	user	root,Engr\root	0.00B -	1 -	
vol2	vxw02	user	root,Engr\root	0.00B -	1 -	
vol2	vxw03	user	root,Engr\root	0.00B -	1 -	
vol2		user	root,Engr\root	0.00B -	5 -	
vol2		user	john,Engr\John	1MB 50MB	1 -	*
vol2	q1	user	john,Engr\John	1MB 50MB	1 -	

28 entries were displayed.

The following example displays the quota report for the quota rules that are applicable for the given path to a file.

```
cluster1::> volume quota report -path /vol/vol2/q1/file1
Vserver: vs0
```

Volume	Tree	Type	ID	---Disk---		---Files---		Quota Specifier
				Used	Limit	Used	Limit	
vol2	q1	tree	1	1MB	100MB	2	10000	q1
vol2	q1	group	root	1MB	-	2	-	
vol2		group	root	1MB	-	6	-	
vol2		user	john,Engr\John	1MB	50MB	1	-	*
vol2	q1	user	john,Engr\John	1MB	50MB	1	-	

5 entries were displayed.

The following example displays the quota report with the target in the numeric form for the given path to a file.

```
cluster1::> volume quota report -path /vol/vol2/q1/file1 -target-id
Vserver: vs0
```

Volume	Tree	Type	ID	---Disk---		---Files---		Quota Specifier
				Used	Limit	Used	Limit	
vol2	q1	tree	1	1MB	100MB	2	10000	q1
vol2	q1	group	0	1MB	-	2	-	
vol2		group	0	1MB	-	6	-	
vol2		user	8017,S-1-5-21-3567637-1906459281-1427260136-60871	1MB	50MB	1	-	*
vol2	q1	user	8017,S-1-5-21-3567637-1906459281-1427260136-60871	1MB	50MB	1	-	

5 entries were displayed.

The following example shows how to monitor the quota report for a particular user/tree/group. First, the quota report command is issued with -instance to see the index field for the quota report entry we are interested in. Next, the quota report is issued with the -index field specified to fetch only that particular quota report entry repeatedly to view the usage over time.

```
cluster1::> volume quota report -vserver vs0 -volume vol1 -quota-type user -quota-target john -tree q1 -instance
```

```

Vserver Name: vs0
Volume Name: vol1
Index: 10
Qtree Name: q1
Quota Type: user
Quota Target: john
Quota Target ID: 5433
Disk Space Used: 50.5MB
Disk Space Limit: 100MB
Files Used: 205
Files Limit: -
Disk Space Threshold: 95MB
Soft Disk Space Limit: 80MB
Soft Files Limit: -

Files Used % File Limit: -

```

volume quota resize

Resize quotas for volumes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command resizes the quota limits for the quotas currently in effect for the specified volume. It creates a job to resize quotas. This command is not supported on Infinite Volumes. You can monitor the progress of the job by using the [“job show” on page 160](#) and [“job watch-progress” on page 168](#) commands.

Note: Quotas must be activated before quota limits can be resized.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the name of the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This specifies the name of the volume on which you are resizing the quota limits and threshold.

[-foreground [true]] - Foreground Process

This optionally specifies whether the job created for resizing quotas runs as a foreground process. The default setting is *false* (that is, the operation runs in the background). When set to *true*, the command will not return until the job completes.

Examples

The following example resizes quotas on the volume named `vol1`, which exists on Vserver `vs0`.

```
cluster1::> volume quota resize -vserver vs0 -volume vol1
[Job 34] Job is queued: Quota RESIZE Operation on vserver vs0 volume vol1.
```

The following example uses a 7G-compatible command to resize quotas on the volume named `vol1` which exists on Vserver `vs0`.

```
cluster1::> vserver context vs0
vs0::> quota resize vol1
[Job 35] Job is queued: Quota RESIZE Operation on vserver vs0 volume vol1.
```

volume quota show

Display quota state for volumes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays information about quotas for online volumes. The command output depends on the parameters specified with the command. Quotas can only be administered on FlexVol volumes. This command is not supported on Infinite Volumes. If no parameters are specified, the command displays the following information for all volumes:

- Vserver name
- Volume name
- Quota state - quota state for this volume. The possible values are as follows:
 - `off` - this state indicates that quotas are deactivated for the volume.
 - `on` - this state indicates that quotas are activated for the volume.
 - `initializing` - this state indicates that quotas are being initialized for the volume.
 - `resizing` - this state indicates that quota limits are being resized for the volume.
 - `corrupt` - this state indicates that quotas are corrupt for this volume.
 - `mixed` - this state may only occur for FlexGroups, and indicates that the constituent volumes are not all in the same state.
- Scan status - percentage of the files in the volume scanned by the quota scanner that runs as part of activating quotas.
- Last error - most recently generated error message as part of the last quota operation (`on` or `resize`). Present only if an error has been generated.

To display detailed information about all volumes, run the command with the `-instance` parameter. The detailed view provides all of the information in the previous list and the following additional information:

- Logging messages - whether quota exceeded syslog/EMS messages are logged or not. For volumes where the quota logging parameter is set to `on`, quota exceeded messages are generated when a NFS/CIFS operation or any internal Data ONTAP operation is being prevented because the quota disk usage is exceeding the disk limit or the quota file usage is exceeding the file limit. For quotas where the logging parameter is set to `off`, no quota exceeded messages are generated.
- Logging interval - frequency with which quota exceeded messages are logged. This parameter only applies to volumes that have the logging parameter set to `on`.

- Sub status - additional status about quotas for this volume. Following are the possible values reported:
 - upgrading - this indicates that the quota metadata format is being upgraded from an older version to a newer version for the volume.
 - setup - this indicates that the quotas are being setup on the volume.
 - transferring rules - this indicates that the quota rules are being transferred to the volume.
 - scanning - this indicates that the quota filesystem scanner is currently running on the volume.
 - finishing - this indicates that the quota on or resize operation is in the final stage of the operation.
 - done - this indicates that the quota operation is finished.
 - none - this indicates that there is no additional status.
- All errors - collection of all the error messages generated as part of the last quota operation (on or resize) since the volume was online.
- User quota enforced (advanced privilege only) - indicates whether there are user quota rules being enforced.
- Group quota enforced (advanced privilege only)- indicates whether there are group quota rules being enforced.
- Tree quota enforced (advanced privilege only) - indicates whether there are tree quota rules being enforced.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-logmsg]

If this parameter is specified, the command displays whether quota exceeded messages are logged and the logging interval for the quota messages.

| [-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

If this parameter is specified, the command displays information for the volumes in the specified Vserver.

[-volume <volume name>] - Volume Name

If this parameter is specified, the command displays information for the specified volume.

[-state <quota_state>] - Quota State

If this parameter is specified, the command displays information for the volumes that have the specified quota state.

[-scan-status <percent>] - Scan Status

If this parameter is specified, the command displays information about the volumes whose scan-status matches the specified percentage value. The scan status is displayed in the format [0-100] %.

[-logging {on|off}] - Logging Messages

If this parameter is specified, the command displays information about the volumes that have the specified logging setting.

[-logging-interval <text>] - Logging Interval

If this parameter is specified, the command displays information about the volumes that have the specified quota logging interval.

[-sub-status <text>] - Sub Quota Status

If this parameter is specified, the command displays information about the volumes that have the specified quota sub-status.

[-last-error <text>] - Last Quota Error Message

If this parameter is specified, the command displays information about the volumes whose last error matches the specified error message.

[-errors <text>] - Collection of Quota Errors

If this parameter is specified, the command displays information about the volumes whose collection of errors match the specified error message.

[-is-user-quota-enforced {true|false}] - User Quota enforced (privilege: advanced)

If this parameter is specified, the command displays information about the volumes that have the specified value for this field.

[-is-group-quota-enforced {true|false}] - Group Quota enforced (privilege: advanced)

If this parameter is specified, the command displays information about the volumes that have the specified value for this field.

[-is-tree-quota-enforced {true|false}] - Tree Quota enforced (privilege: advanced)

If this parameter is specified, the command displays information about the volumes that have the specified value for this field.

Examples

The following example displays information about all volumes on the Vserver named vs0.

```
cluster1::> volume quota show -vserver vs0
```

Vserver	Volume	State	Scan Status
vs0	root_vs0	off	-
vs0	vol1	off	-
	Last Error: Volume vol1 has no valid quota rules		
vs0	vol2	on	-
vs0	vol3	initializing	30%

4 entries were displayed.

The following example displays the logging information for all the volumes.

```
cluster1::> volume quota show -logmsg
```

Vserver	Volume	State	Logging Message	Logging Interval
vs0	root_vs0	off	-	-
vs0	vol1	off	-	-
vs0	vol2	on	on	1h
vs0	vol3	on	on	1h

4 entries were displayed.

The following example displays detailed information in advanced privilege for a volume vol1, which exists on Vserver vs0

```
cluster1::> set advanced
```

Warning: These advanced commands are potentially dangerous; use them only when directed to do so by NetApp personnel.
Do you want to continue? {y|n}: y

```
cluster1::*> volume quota show -instance -vserver vs0 -volume vol1
```

```

Vserver Name: vs0
Volume Name: vol1
Quota State: on
Scan Status: -
Logging Messages: on
Logging Interval: 1h

```

```

        Sub Quota Status: none
    Last Quota Error Message: -
Collection of Quota Errors: -
        User Quota enforced: true
        Group Quota enforced: false
        Tree Quota enforced: false

```

The following example displays detailed information in advanced privilege for a volume vol1, which exists on Vserver vs0

```
cluster1::> set advanced
```

```

Warning: These advanced commands are potentially dangerous; use them only when
directed to do so by NetApp personnel.
Do you want to continue? {y|n}: y

```

```
cluster1::*> volume quota show -instance -vserver vs0 -volume vol1
```

```

        Vserver Name: vs0
        Volume Name: vol1
        Quota State: on
        Scan Status: -
    Logging Messages: on
    Logging Interval: 1h
    Sub Quota Status: none
    Last Quota Error Message: -
Collection of Quota Errors: -
        User Quota enforced: true
        Group Quota enforced: false
        Tree Quota enforced: false

```

The following example displays the detailed information when quotas are upgrading for volume vol1, which exists on Vserver vs0.

```
cluster1::> volume quota show -instance -vserver vs0 -volume vol1
```

```

        Vserver Name: vs0
        Volume Name: vol1
        Quota State: initializing
        Scan Status: 3%
    Logging Messages: -
    Logging Interval: -
    Sub Quota Status: upgrading
    Last Quota Error Message: -
Collection of Quota Errors: -

```

The following example displays the "Last Quota Error Message" and the "Collection of Quota Errors" for volume vol1, which exists on Vserver vs0

```
cluster1::> volume quota show -instance -vserver vs0 -volume vol1
```

```

        Vserver Name: vs0
        Volume Name: vol1
        Quota State: on
        Scan Status: -
    Logging Messages: on
    Logging Interval: 1h
    Sub Quota Status: none
    Last Quota Error Message: second definition for user2 (type:user target:user2,user4 qtree:"").
Collection of Quota Errors: second definition for user1 (type:user target:user1,user3 qtree:"").
                           second definition for user2 (type:user target:user2,user4 qtree:"").

```

volume quota policy commands

Manage quota policies for a Vserver

volume quota policy copy

Copy a quota policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command copies a quota policy and the rules it contains. This command is not supported on Infinite Volumes. You must enter the following information to copy a quota policy:

- Vserver name
- Policy name
- New policy name

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver from which you are copying the quota policy.

-policy-name <text> - Policy Name

This parameter specifies the name of the quota policy you are copying.

-new-policy-name <text> - New Policy Name

This parameter specifies the name of the new quota policy you are copying to. The new name cannot have more than 32 characters.

Examples

The following example copies a quota policy named quota_policy_0 on Vserver vs0. It is copied to quota_policy_1.

```
cluster1::> volume quota policy copy -vserver vs0 -policy-name quota_policy_0 -new-policy-name quota_policy_1
```

volume quota policy create

Create a quota policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

A quota policy is collection of quota rules for all the volumes in a specific Vserver. This command creates a quota policy for a specific Vserver. Multiple quota policies can be created for a Vserver, but only one of them can be assigned to the Vserver. A Vserver can have a maximum of five quota policies. If five quota policies already exist, the command fails and a quota policy must be deleted before another quota policy can be created. This command is not supported on Infinite Volumes.

When you turn on quotas for a volume, the quota rules to be enforced on that volume will be picked from the quota policy that is assigned to the Vserver containing that volume. The quota policy for clustered volumes is equivalent to the /etc/quotas file in 7G.

You must enter the following information to create a quota policy:

- Vserver name
- Policy name

Parameters

-vserver <*vserver name*> - **Vserver**

This parameter specifies the Vserver for which you are creating the quota policy. You can create a quota policy only for a data Vserver. Quota policies cannot be created for a node or admin Vserver.

-policy-name <*text*> - **Policy Name**

This parameter specifies the name of the quota policy you are creating. The quota policy name cannot be more than 32 characters long and must be unique within the Vserver.

Examples

The following example creates a quota policy named `quota_policy_0` on Vserver `vs0`.

```
cluster1::> volume quota policy create -vserver vs0 -policy-name quota_policy_0
```

volume quota policy delete

Delete a quota policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command deletes a quota policy and all the rules it contains. The policy can be deleted only when it is not assigned to the Vserver. This command is not supported on Infinite Volumes. You must enter the following information to delete a quota policy:

- Vserver name
- Policy name

Parameters

-vserver <*vserver name*> - **Vserver**

This parameter specifies the Vserver containing the quota policy you want to delete.

-policy-name <*text*> - **Policy Name**

This parameter specifies the name of the quota policy you want to delete.

Examples

The following example deletes a quota policy named `quota_policy_5` on Vserver `vs0`.

```
cluster1::> volume quota policy delete -vserver vs0 -policy-name quota_policy_5
```

volume quota policy rename

Rename a quota policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command renames a quota policy. This command is not supported on Infinite Volumes. You must enter the following information to rename a quota policy:

- Vserver name
- Policy name
- New policy name

Parameters

-vserver <*vserver name*> - **Vserver**

This parameter specifies the Vserver containing the quota policy you want to rename.

-policy-name <text> - Policy Name

This parameter specifies the name of the quota policy you are renaming.

-new-policy-name <text> - New Policy Name

This parameter specifies the new name of the quota policy. The new name cannot be more than 32 characters long.

Examples

The following example renames a quota policy named `quota_policy_0` on Vserver `vs0`. The policy's new name is `quota_policy_1`.

```
cluster1::> volume quota policy rename -vserver vs0 -policy-name quota_policy_0 -new-policy-name quota_policy_1
```

volume quota policy show

Display the quota policies

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays information about quota policies. This command is not supported on Infinite Volumes. The command displays the following information about all quota policies:

- Vserver name
- Policy name
- When the policy was last modified

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If this parameter is specified, the command displays information about the quota policies for the specified Vserver.

[-policy-name <text>] - Policy Name

If this optional parameter is specified, the command displays information about quota policies that match the specified name.

[-last-modified <MM/DD/YYYY HH:MM:SS>] - Last Modified

If this optional parameter is specified, the command displays information about quota policies with the last modified time that match the given time.

Examples

The following example displays information about all quota policies.

```
cluster1::> volume quota policy show
```

Vserver	Policy Name	Last Modified
vs0	quota_policy_vs0	10/16/2008 17:40:05
vs1	quota_policy_vs1	10/16/2008 17:47:45
vs2	quota_policy_vs2	10/16/2008 17:44:13
vs3	quota_policy_vs3	10/16/2008 17:44:13

4 entries were displayed.

The following example displays information about all quota policies along with the policy ID in the diagnostic privilege.

```
cluster1::> set -privilege diagnostic
Warning: These diagnostic commands are for use by NetApp personnel
```

```

only.
Do you wish to continue? (y or n): y
cluster1:*> volume quota policy show
Vserver          Policy Name      Last Modified      Policy ID
-----
vs0              quota_policy_vs0  10/16/2008 17:40:05  8589934594
vs1              quota_policy_vs1  10/16/2008 17:47:45  8589934593
vs2              quota_policy_vs2  10/16/2008 17:44:13  8589934595
vs3              quota_policy_vs3  10/16/2008 17:44:13  12884901889
4 entries were displayed.

```

volume quota policy rule commands

Manage the rules for a quota policy

volume quota policy rule create

Create a new quota rule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command creates a quota policy rule. This command is not supported on Infinite Volumes. You must enter the following information to create a quota policy rule:

- Vserver name
- Quota policy name
- Volume name
- Quota target type
- Target to which the rule applies
- Qtree to which the rule applies

You can optionally specify the following additional attributes for the quota policy rule:

- User mapping
- Hard disk limit
- Hard file limit
- Threshold for disk limit
- Soft disk limit
- Soft file limit

Note: For a new quota policy rule to get enforced on the volume, you should create the rule in the quota policy assigned to the Vserver. Additionally, a quota off and on or a quota resize operation must be done using the " [volume quota modify](#) " on page 1451 " command.

Parameters

-vsriver <vserver name> - Vserver

This parameter specifies the Vserver containing the quota policy for which you are creating a rule.

-policy-name <text> - Policy Name

This parameter specifies the name of the quota policy in which you are creating a rule.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume for which you are creating a rule.

-type {tree|user|group} - Type

This parameter specifies the quota target type of the rule you are creating.

-target <text> - Target

This parameter specifies the target to which the quota policy rule applies. For default quota rules, this parameter should be specified as "". For explicit tree quotas rules, this parameter should indicate the qtree name. For explicit user quota rules, this parameter can contain UNIX user name, UNIX user identifier, Windows user name, Windows Security Identifier or a path to an existing object within the volume. If a name contains a space, enclose the entire value in quotes. A UNIX user name cannot include a backslash (\) or an @ sign; user names with these characters are treated as Windows names. For multi-user quotas, this parameter can contain multiple user targets separated by a comma. For explicit group quota rules, this parameter can contain UNIX group name or UNIX group identifier or a path to an existing object within the volume. When a path is specified as the target, it should be of the format /vol/<vol-name>/<path to file from volume root> where the volume matches that of the -volume parameter.

-qtree <qtree name> - Qtree Name

This parameter specifies the name of the qtree to which the quota rule applies. This parameter is not applicable for tree type rules. For user or group type rules at the volume level, this parameter should contain "".

[-user-mapping {on|off}] - User Mapping

This parameter optionally specifies if user mapping needs to be performed for a user quota rule. If this parameter is "on", the UNIX user name specified as the quota target will be mapped to the corresponding Windows user name or vice-versa and quota accounting will be performed for the users together. The mapping will be obtained as configured in "[vserver name-mapping](#)" on page 1804".

Note that this parameter can be specified only for quota policy rules of type user. A value of "on" can be specified for this parameter only if the quota target is a UNIX user name or a Windows user name and cannot be specified for multi-user quota targets.

[-disk-limit {<size>|-}] - Disk Limit

This parameter optionally specifies a hard limit for the disk space that can be consumed by the quota target. The default unit for the disk limit is assumed to be Kilobytes if no units are specified. When the hard disk space limit is reached, no additional disk space can be consumed by the specified target. The value that you specify for this parameter should be greater than or equal to the threshold and soft disk limit. A disk limit of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 1,125,899,906,842,620 KB, which is approximately 1,023 PB. The value should be a multiple of 4 KB. If it is not, this field can appear incorrect in quota reports. This happens because the field is always rounded up to the nearest multiple of 4 KB to match disk space limits, which are translated into 4-KB disk blocks. The value can be larger than the amount of disk space available in the volume.

[-file-limit {<integer>|-}] - Files Limit

This parameter optionally specifies a hard limit for the number of files permitted on the quota target. When the hard number of files limit is reached, no additional files can be created by the specified target. The value that you specify for this parameter should be greater than or equal to the soft file limit. A file limit of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 4,294,967,295.

[-threshold {<size>|-}] - Threshold for Disk Limit

This parameter optionally specifies the disk limit threshold for the quota target. The default unit for the disk limit threshold is assumed to be Kilobytes if no units are specified. When the disk limit threshold is exceeded, a console message, EMS events, and SNMP traps are generated. The value that you specify for this parameter should be greater than or equal to the soft disk limit and equal to or less than the disk limit. A threshold of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 1,125,899,906,842,620 KB, which is approximately 1,023 PB. The value should be a multiple of 4 KB. If it is not, this field can appear incorrect in quota reports. This happens because the field is always rounded up to the nearest multiple of 4 KB to match disk space limits, which are translated into 4-KB disk blocks.

[-soft-disk-limit {<size>|-}] - Soft Disk Limit

This parameter optionally specifies a soft limit for the disk space that can be consumed by the quota target. The soft disk limit indicates that the hard limit for the disk space will soon be exceeded. The default unit for the soft disk limit is assumed to be Kilobytes if no units are specified. When the soft limit for the disk space is exceeded, a console message, EMS events and SNMP traps are generated. The same happens when the disk space used goes below the specified limit. The value that you specify for this parameter should be equal to or less than the threshold and the disk limit. A soft disk limit of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 1,125,899,906,842,620 KB, which is approximately 1,023 PB. The value should be a multiple of 4 KB. If it is not, this field can appear incorrect in quota reports. This happens because the field is always rounded up to the nearest multiple of 4 KB to match disk space limits, which are translated into 4-KB disk blocks.

[-soft-file-limit {<integer>|-}] - Soft Files Limit

This parameter optionally specifies a soft limit for the number of files permitted on the quota target. The soft file limit indicates that the hard limit for the number of files will soon be exceeded. When the soft limit for the number of files is exceeded, a console message, EMS events and SNMP traps are generated. The same happens when the files used goes below the specified limit. The value that you specify for this parameter should be equal to or less than the file limit. A soft file limit of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 4,294,967,295.

Examples

The following example creates a default tree quota rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota_policy_0*. This quota policy applies to all qtrees on volume *vol0*.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user -target ""
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota_policy_0*. This quota policy applies to the UNIX user *myuser* for a qtree named *qtree1* on volume *vol0* with a disk limit of 20 Gigabytes, soft disk limit of 15.4 Gigabytes and threshold limit of 15.4 Gigabytes. User mapping is turned on for this rule.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user -target myuser
-qtree qtree1 -user-mapping on -disk-limit 20GB -soft-disk-limit 15.4GB
-threshold 15.4GB
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota_policy_0*. This quota policy applies to the Windows user *DOMXYZ\myuser* for a qtree named *qtree1* on volume *vol0* with a file limit of 40000 and a soft file limit of 26500. User mapping is turned on for this rule.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user -target DOMXYZ\myuser
-qtree qtree1 -user-mapping on -file-limit 40000 -soft-file-limit 26500
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota_policy_0*. This quota policy applies to the UNIX user identifier 12345 for a qtree named *qtree1* on volume *vol0*.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user -target 12345
-qtree qtree1
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota_policy_0*. This quota policy applies to the Windows Security Identifier *S-123-456-789* for a qtree named *qtree1* on volume *vol0*.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user
-target S-123-456-789 -qtree qtree1
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota_policy_0*. This quota policy applies to the UNIX group *engr* for a qtree named *qtree1* on volume *vol0*.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type group -target engr
-qtree qtree1
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota_policy_0*. This quota policy applies to the user who is the owner of the file */vol/vol0/qtree1/file1.txt* for qtree *qtree1* on volume *vol0*.

```
cluster1::> volume quota policy rule create -vserver vs0 -policy-name
quota_policy_0 -volume vol0 -type user -target /vol/vol0/qtree1/file1.txt
-qtree qtree1
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota_policy_0*. This quota policy applies to the users specified in the target for qtree *qtree1* on volume *vol0*.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user
-target user1,DOMXYZ\user2,23457,S-126-098-567,/vol/vol0/qtree1/file2.txt
-qtree qtree1
```

volume quota policy rule delete

Delete an existing quota rule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume quota policy rule delete` command deletes a quota policy rule. This command is not supported on Infinite Volumes. You must enter the following information to delete a quota policy rule:

- Vserver name
- Quota policy name
- Volume name
- Quota target type
- Target to which the rule applies
- Qtree to which the rule applies

Note: If the rule being deleted belongs to the quota policy that is currently assigned to the Vserver, enforcement of the rule on the volume must be terminated by performing a quota off and on or a quota resize operation using the " [volume quota modify](#) " on [page 1451](#) " command.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver containing the quota policy for which you are deleting a rule.

-policy-name <text> - Policy Name

This parameter specifies the name of the quota policy in which you are deleting a rule.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume for which you are deleting a rule.

-type {tree|user|group} - Type

This parameter specifies the quota target type for the rule.

-target <text> - Target

This parameter specifies the target to which the quota policy rule applies.

-qtree <qtree name> - Qtree Name

This parameter specifies the name of the qtree for which you are deleting a rule.

Examples

The following example deletes a quota policy rule on Vserver vs1 for the quota policy named quota_policy_1. This quota policy applies to the group named engr for the qtree named qtree1 on volume vol1.

```
cluster1::> volume quota policy rule delete -vserver vs1
-policy-name quota_policy_1 -volume vol1 -type group -target engr
-qtree qtree1
```

volume quota policy rule modify

Modify an existing quota rule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command can be used to modify the following attributes of a quota policy rule:

- User mapping
- Hard disk limit
- Hard file limit
- Threshold for disk limit
- Soft disk limit
- Soft file limit

Note: If the rule being modified belongs to the quota policy that is currently assigned to the Vserver, rule enforcement on the volume must be enabled by performing a quota off and on or a quota resize operation using the "[“volume quota modify” on page 1451](#)" command.

This command is not supported on Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver containing the quota policy for which you are modifying a rule.

-policy-name <text> - Policy Name

This parameter specifies the name of the quota policy in which you are modifying a rule.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume for which you are modifying a rule.

-type {tree|user|group} - Type

This parameter specifies the quota target type for the rule you are modifying.

-target <text> - Target

This parameter specifies the target to which the quota policy rule applies. If the target is a user, the user ID or username must be the same one that was used to create the quota. The same restriction is there for both group ID or groupname and Windows SID or Windows account name.

-qtree <qtree name> - Qtree Name

This parameter specifies the name of the qtree to which the quota policy rule applies.

[-user-mapping {on|off}] - User Mapping

This parameter optionally modifies the user mapping for a user quota rule. The value for this parameter can be modified only for quota policy rules of type user. A value of "on" can be specified for this parameter only if the quota target is a unix user name or a Windows user name and cannot be specified for multi-user quota targets. If this parameter is "on", the unix user name specified as the quota target will be mapped to the corresponding Windows user name or vice-versa and quota accounting will be performed for the users together.

[-disk-limit {<size>|-}] - Disk Limit

This parameter optionally modifies the hard limit for the disk space that can be consumed by the quota target. The default unit for the disk limit is assumed to be Kilobytes if no units are specified. The value that you specify for this parameter should be greater than or equal to the threshold and soft disk limit. A disk limit of unlimited can be specified with a "-" for this parameter.

[-file-limit {<integer>|-}] - Files Limit

This parameter optionally modifies the hard limit for the number of files permitted on the quota target. The value that you specify for this parameter should be greater than or equal to the soft file limit. A file limit of unlimited can be specified with a "-" for this parameter.

[-threshold {<size>|-}] - Threshold for Disk Limit

This parameter optionally modifies the disk limit threshold for the quota target. The default unit for the disk limit threshold is assumed to be Kilobytes if no units are specified. The value that you specify for this parameter should be greater than or equal to the soft disk limit and equal to or less than the disk limit. A threshold limit of unlimited can be specified with a "-" for this parameter.

[-soft-disk-limit {<size>|-}] - Soft Disk Limit

This parameter optionally modifies the soft limit for the disk space that can be consumed by the quota target. The default unit for the soft disk limit is assumed to be Kilobytes if no units are specified. The value that you specify for this parameter should be equal to or less than the threshold and the disk limit. A soft disk limit of unlimited can be specified with a "-" for this parameter.

[-soft-file-limit {<integer>|-}] - Soft Files Limit

This parameter optionally modifies the soft limit for the number of files permitted on the quota target. The value that you specify for this parameter should be equal to or less than the file limit. A soft file limit of unlimited can be specified with a "-" for this parameter.

Examples

The following example modifies a quota policy rule for the quota policy named quota_policy_0. This quota policy exists on Vserver vs0 and applies to the user named myuser for qtree named qtree1 on volume vol0. The user mapping is turned on, the hard disk limit is set to 20 GB and the hard file limit is set to 100,000 files.

```
cluster1::> volume quota policy rule modify -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user -target myuser
-qtree qtree1 -user-mapping on -disk-limit 20GB -file-limit 100000
```

volume quota policy rule show

Display the quota rules

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the following information about quota policy rules by default.

- Vserver name
- Quota policy name
- Volume name
- Type of quota policy rule

- Target of the quota policy rule
- Qtree name
- User mapping
- Hard disk limit
- Soft disk limit
- Hard file limit
- Soft file limit
- Threshold for disk limit

This command is not supported on Infinite Volumes.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If this parameter is specified, the command displays information about quota rules for the quotas contained on volumes on the specified Vserver.

[-policy-name <text>] - Policy Name

If this parameter is specified, the command displays information about quota rules for the specified quota policy.

[-volume <volume name>] - Volume Name

If this parameter is specified, the command displays information about quota rules for the quota policy associated with the specified volume.

[-type {tree|user|group}] - Type

If this parameter is specified, the command displays information about quota rules for the specified quota type.

[-target <text>] - Target

If this parameter is specified, the command displays information about quota rules for the specified target.

[-qtree <qtree name>] - Qtree Name

If this parameter is specified, the command displays information about quota rules for the specified qtree.

[-user-mapping {on|off}] - User Mapping

If this parameter is specified, the command displays information about quota rules having the specified user-mapping value.

[-disk-limit {<size>|-}] - Disk Limit

If this parameter is specified, the command displays information about quota rules having the specified hard disk limit.

[-file-limit {<integer>|-}] - Files Limit

If this parameter is specified, the command displays information about quota rules having the specified hard file limit.

[-threshold {<size>|-}] - Threshold for Disk Limit

If this parameter is specified, the command displays information about quota rules having the specified disk limit threshold.

[-soft-disk-limit {<size>|-}] - Soft Disk Limit

If this parameter is specified, the command displays information about quota rules having the specified soft disk limit.

[-soft-file-limit {<integer>|-}] - Soft Files Limit

If this parameter is specified, the command displays information about quota rules having the specified soft file limit.

Examples

The following example displays information about all the quota policy rules in a cluster. There is one user rule that exists on Vserver vs0 for the quota policy named quota_policy_0. This quota policy applies to the user named myuser for qtree named qtree0 on volume vol0.

```
cluster1::> volume quota policy rule show
```

```
Vserver: vs0      Policy: quota_policy_0      Volume: vol0
```

Type	Target	User	Disk	Disk	Soft	Soft	
		Qtree	Mapping	Limit	Limit	Files	Files
						Limit	Limit
							Threshold
tree	myuser	qtree0	on	20GB	18GB	100000	80000
							16GB

volume quota policy rule count commands

Display count of quota rules

volume quota policy rule count show

Display count of quota rules

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays various counts of quota policy rules defined within a quota policy. By default, the subtotal for each volume is displayed. Optionally, the command can provide the total rule count across the entire quota policy or detailed subtotals organized by qtree and quota rule type.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-detail]

Displays rule count subtotals for each quota rule type. The subtotals for each type are computed for a specific volume and qtree.

| [-hierarchy]

Displays rule count subtotals in hierarchical format with subtotals at the quota policy, volume, qtree, and quota rule type levels.

| [-total]

Displays the total rule count for each Vserver and quota policy.

| [-instance]}

Displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

Displays quota rule counts for the specified Vserver.

[-policy-name <text>] - Policy Name

Displays quota rule counts for the specified quota policy.

[-volume <volume name>] - Volume Name

Displays quota rule counts for the specified volume.

[-qtree <qtree name>] - Qtree Name

Displays quota rule counts for the specified qtree.

[-type {tree|user|group}] - Type

Displays quota rule counts for the specified quota rule type.

[-count-where-policy-volume-qtree-type <integer>] - Qtree/Type Subtotal

Subtotal of rules matching the given Vserver, quota policy, volume, qtree, and quota rule type. If specified as input, only matching totals are displayed.

[-count-where-policy-volume-qtree <integer>] - Qtree Subtotal

Subtotal of rules matching the given Vserver, quota policy, volume, and qtree. All quota rule types are included. If specified as input, only matching totals are displayed.

[-count-where-policy-volume-type <integer>] - Volume/Type Subtotal

Subtotal of rules matching the given Vserver, quota policy, volume, and quota rule type. All qtrees are included. If specified as input, only matching totals are displayed.

[-count-where-policy-volume <integer>] - Volume Subtotal

Subtotal of rules matching the given Vserver, quota policy, and volume. All qtrees and quota rule types are included. If specified as input, only matching totals are displayed.

[-count-where-policy-type <integer>] - Policy/Type Subtotal

Subtotal of rules matching the given Vserver, quota policy, and quota rule type. All volumes and qtrees are included. If specified as input, only matching totals are displayed.

[-count-where-policy <integer>] - Policy Total

Total rule count matching the given Vserver and quota policy. All volumes, qtrees, and quota rule types are included. If specified as input, only matching totals are displayed.

Examples

The following example shows quota rule counts for Vserver *vs0*, quota policy *default*. The total number of rules in quota policy *default* is 7500. There are two volumes with quota rules configured. Volume *volume0* has a total of 1000 rules, and *volume1* has a total of 6500 rules.

```
cluster1::> volume quota policy rule count show -vserver vs0 -policy-name default
```

Vserver: vs0	Policy: default
Volume	Rule Count
-----	-----
volume0	1000
volume1	6500

2 entries were displayed.

volume reallocation commands

Commands for measuring and optimizing data layout

volume reallocation measure

Start reallocate measure job

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Performs a measure-only reallocation check on a LUN, NVMe namespace, file, or volume. At the end of each check, the system logs the optimization results in the Event Message System (EMS). If you use the logfile,

the system records detailed information about the LUN, NVMe namespace, file, or volume layout in the log file. To view previous measure-only reallocation checks, use the [“volume reallocation show” on page 1479](#) command.

Note: This command is not supported for FlexGroups, FlexGroup Constituents, Infinite Volumes, or Infinite Volume constituents.

Parameters

-vserver <vserver name> - Vserver

Specifies the Vserver.

-path <text> - Path

Specifies the path of the reallocation for a LUN, NVMe namespace, file, or volume.

{ [-interval | -i <text>] - Interval Schedule

Specifies the reallocation scan interval in

- m for minutes
- h for hours
- d for days

For example, 30m is a 30 minute interval. The countdown to the next scan begins after the first scan is complete.

The default interval is 24 hours.

| [-once | -o [true]] - Once

Specifies that the job runs once and then is automatically removed from the system when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation scan runs as scheduled. If you enter this parameter without a value, it is set to true and a reallocation scan runs once.

[-logpath | -l <text>] - Log Path

Specifies the path for reallocation logs.

[-threshold | -t <integer>] - Threshold

Specifies the threshold when a LUN, NVMe namespace, file, or volume is considered unoptimized and a reallocation should be performed. Once the threshold is reached, the system creates a diagnostic message that indicates that a reallocation might improve performance.

The threshold range is from 3 (the layout is moderately optimized) to 10 (the layout is not optimal). The threshold default is 4.

Examples

```
cluster1::> volume reallocation measure -path /vol/vol2 -once
[Job 167] Job is queued: Reallocate Job.
```

volume reallocation off

Disable reallocate jobs

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Disables all reallocation jobs globally in a cluster. After you use this command, you cannot start or restart any reallocation jobs. All jobs that are executing when you use this command are stopped. You must use the [“reallocate on” on page 1477](#) command to enable or restart reallocation jobs globally in a cluster.

Note: This command is not supported for FlexGroups, FlexGroup constituents, Infinite Volumes, or Infinite Volume constituents.

Examples

```
cluster1::> volume reallocation off
```

volume reallocation on

Enable reallocate jobs

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Globally enables all reallocation jobs in a cluster. You must globally enable reallocation scans in the cluster before you can run a scan or schedule regular scans. Reallocation scans are disabled by default.

Note: This command is not supported for FlexGroups, FlexGroup constituents, Infinite Volumes, or Infinite Volume constituents.

Examples

```
cluster1::> volume reallocation on
```

volume reallocation quiesce

Quiesce reallocate job

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Temporarily stops any reallocation jobs that are in progress. When you use this command, the persistent state is saved. You can use the [“volume reallocation restart” on page 1477](#) command to restart a job that is quiesced.

There is no limit to how long a job can remain in the quiesced state.

Note: This command is not supported for FlexGroups, FlexGroup constituents, Infinite Volumes, or Infinite Volume constituents.

Parameters

-vserver <vserver name> - Vserver

Specifies the Vserver.

-path <text> - Path

Specifies the file path of the LUN, NVMe namespace, file, or volume that you want to stop temporarily.

Examples

```
cluster1::> volume reallocation quiesce /vol/vol2
2 entries were acted on.
```

volume reallocation restart

Restart reallocate job

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Starts a reallocation job. Use this command to start a quiesced (temporarily stopped) job or a scheduled scan that is idle.

Note: This command is not supported on FlexGroups, FlexGroup constituents, or Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver

Specifies the Vserver.

-path <text> - Path

Specifies the file path of the LUN, NVMe namespace, file, or volume on which you want to restart reallocation scans.

[-ignore-checkpoint | -i [true]] - Ignore Checkpoint

Restarts the job at the beginning when set to true. If you use this command without specifying this parameter, its effective value is false and the job starts the scan at the point where it stopped. If you specify this parameter without a value, it is set to true and the scan restarts at the beginning.

Examples

```
cluster1::> volume reallocation restart /vol/vol2
2 entries were acted on.
```

volume reallocation schedule

Modify schedule of reallocate job

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Schedules a reallocation scan for an existing reallocation job. If the reallocation job does not exist, use the [“volume reallocation start” on page 1480](#) command to define a reallocation job.

You can delete an existing reallocation scan schedule. However, if you do this, the job's scan interval reverts to the schedule that was defined for it when the job was created with the [“volume reallocation start” on page 1480](#) command.

Note: This command is not supported for FlexGroups, FlexGroup constituents, Infinite Volumes, or Infinite Volume constituents.

Parameters

-vserver <vserver name> - Vserver

Specifies the Vserver.

-path <text> - Path

Specifies the path of the reallocation for a LUN, NVMe namespace, file, or volume.

[-del | -d [true]] - Delete

Deletes an existing reallocation schedule when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation schedule is not deleted. If you specify this parameter without a value, it is set to true and the reallocation schedule is deleted.

[-cron | -s <text>] - Cron Schedule

Specifies the schedule with the following four fields in sequence. Use a space between field values. Enclose the values in double quotes.

- minute is a value from 0 to 59.

- hour is a value from 0 (midnight) to 23 (11:00 p.m.).
- day of week is a value from 0 (Sunday) to 6 (Saturday).
- day of month is a value from 1 to 31.

Note: If you specify 31 as the value for the day of month, reallocation scans will not run in any months with fewer than 31 days.

Use an asterisk "*" as a wildcard to indicate every value for that field. For example, an * in the day of month field means every day of the month. You cannot use the wildcard in the minute field.

You can enter a number, a range, or a comma-separated list of values for a field.

Examples

```
cluster1::> volume reallocation schedule -s "0 23 6 *" /vol/db/lun1
```

volume reallocation show

Show reallocate job status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Displays the status of a reallocation scan, including the state, schedule, interval, optimization, and log files. If you do not specify the `path` for a particular reallocation scan, then the command displays all the reallocation scans.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-v]

Specify this parameter to display the output in a verbose format.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

Specify this parameter to display reallocation scans that match the Vserver that you specify.

[-path <text>] - Path

Specify this parameter to display reallocation scans that match the path that you specify.

[-threshold | -t <integer>] - Threshold

Specify this parameter to display reallocation scans that match the threshold that you specify.

[-id <integer>] - Job ID

Specify this parameter to display reallocation scans that match the reallocation job ID that you specify.

[-description <text>] - Job Description

Specify this parameter to display reallocation scans that match the text description that you specify.

[-state {Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - Job State

Specify this parameter to display reallocation jobs that match the state that you specify.

[-progress <text>] - Execution Progress

Specify this parameter to list the running reallocation jobs whose progress indicator matches the text that you provide. For example, if you specify "Starting ..." as the text string for the progress option, then the system lists all of the jobs that are starting.

[-schedule <job_schedule>] - Schedule Name

Specify this parameter to display reallocation scans that match the schedule name that you specify. If you want a list of all job schedules, use the ["job schedule show" on page 178](#) command.

[-global-status <text>] - Global State of Scans

Specify this parameter to indicate if reallocation scans are on or off globally. You must type either of the following text strings:

- "Reallocation scans are on"
- "Reallocation scans are off"

Examples

```
cluster1::> volume reallocation show
Vserver      Description              Schedule      State
-----
Reallocation scans are on
vs0          /vol/vol2,space-optimized  reallocate_1d  Queued
```

volume reallocation start

Start reallocate job

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Begins a reallocation scan on a LUN, NVMe namespace, file, or volume when you specify the path. If a volume has several small files that would benefit from periodic optimization, specify the /vol/volname.

Before performing a reallocation scan, the reallocation job normally performs a check of the current layout optimization. If the current layout optimization is less than the threshold, then the system does not perform a reallocation on the LUN, NVMe namespace, file, or volume.

You can define the reallocation scan job so that it runs at a specific interval, or you can use the ["volume reallocation schedule" on page 1478](#) command to schedule reallocation jobs.

Note: This command is not supported for FlexGroups, FlexGroup constituents, Infinite Volumes, or Infinite Volume constituents.

Parameters

-vserver <vserver name> - Vserver

Specifies the Vserver.

-path <text> - Path

Specifies the path of the reallocation for a LUN, NVMe namespace, file, or volume.

{ [-interval | -i <text>] - Interval Schedule

Specifies the reallocation scan interval in

- m for minutes
- h for hours
- d for days

For example, 30m is a 30 minute interval. The countdown to the next scan begins after the first scan is complete.

The default interval is 24 hours.

| [-once | -o *[true]*] - Once

Specifies that the job runs once and then is automatically removed from the system when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation scan runs as scheduled. If you enter this parameter without a value, it is set to true and a reallocation scan runs once.

| [-force | -f *[true]*] - Force

Performs a one-time full reallocation on a LUN, file, or volume when set to true. A forced reallocation rewrites blocks on a LUN, file, or volume unless the reallocation would result in worse performance. If you use this command without specifying this parameter, its effective value is false and a forced reallocation is not performed. If you specify this parameter without a value, it is set to true, and a forced reallocation is performed.

{ [-space-optimized | -p *[true]*] - Space Optimized

Specifies that snapshot blocks are not copied to save space when set to true. If you use this command without specifying this parameter, its effective value is false and snapshot blocks are copied. However, reads from snapshots might have a slightly higher latency. If you specify this parameter without a value, it is set to true and snapshot blocks are not copied. You cannot use the `space-optimized` option with the `unshare` option.

| [-unshare | -u *[true]*] - Unshare Deduplicated Blocks

Specifies that blocks that are shared by deduplication will be unshared. This option can help remove fragmentation caused on dense volumes. This may result in increased disk usage, especially for full reallocation. You cannot use the `unshare` option with the `space-optimized` option.

{ [-threshold | -t *<integer>*] - Threshold

Specifies the threshold when a LUN, NVMe namespace, file, or volume is considered unoptimized and a reallocation should be performed. Once the threshold is reached, the system creates a diagnostic message that indicates that a reallocation might improve performance.

The threshold range is from 3 (the layout is moderately optimized) to 10 (the layout is not optimal). The threshold default is 4.

| [-no-check | -n *[true]*] - No Threshold Check

Does not check the current layout to determine if a reallocation is needed when set to true. If you use this command without specifying this parameter, its effective value is false and the system does check the current layout to determine if a reallocation is needed. If you specify this parameter without a value, it is set to true and the system does not check the current layout to determine if a reallocation is needed.

Examples

```
cluster1::> volume reallocation start -path /vol/vol2 -interval 30m
[Job 165] Job is queued: Reallocate Job.
```

volume reallocation stop

Stop reallocate job

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Stops and deletes any reallocation scans on a LUN, NVMe namespace, file, or volume. This command stops and deletes in-progress, scheduled, and quiesced scans.

Note: This command is not supported for FlexGroups, FlexGroup constituents, Infinite Volumes, or Infinite Volume constituents.

Parameters

-vserver <*vserver name*> - **Vserver**

Specifies the Vserver.

-path <*text*> - **Path**

Specifies the path of the reallocation for a LUN, NVMe namespace, file, or volume.

Examples

```
cluster1::> volume reallocation stop /vol/vol2
1 entry was deleted.
```

volume schedule-style commands

The schedule-style directory

volume schedule-style prepare-to-downgrade

Disables volume schedule style feature and sets schedule style to default (create-time)

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command will disable the volume schedule style feature and set schedule style to default (create-time).

Examples

The following example prepares the schedule-style on all volumes for revert/downgrade.

```
cluster1::*> volume schedule-style prepare-to-downgrade
```

Volume SnapLock Commands

Manages SnapLock attributes of a SnapLock volume

Manages SnapLock attributes in the system.

volume snaplock modify

Modify SnapLock attributes of a SnapLock volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snaplock modify` command modifies one or more SnapLock attributes of a SnapLock volume.

Parameters

-vserver <*vserver name*> - **Vserver**

This specifies the vservers which owns the required SnapLock volume.

-volume <*volume name*> - **Volume**

This specifies the SnapLock volume whose attribute needs to be modified.

{ [-minimum-retention-period {<integer> seconds|minutes|hours|days|months|years} | infinite]} - Minimum Retention Period

Specifies the minimum allowed retention period for files committed to WORM state on the volume. Any files committed with a retention period shorter than this minimum value, is assigned this minimum value.

If this option value is *infinite*, then every file committed to the volume will have a retention period that never expires.

Otherwise, the retention period is specified as a number followed by a suffix. The valid suffixes are seconds, minutes, hours, days, months, and years. For example, a value of 6months represents a retention period of 6 months. The maximum allowed retention period is 70 years. This option is not applicable while extending retention period of an already committed WORM file.

`[-default-retention-period <integer> seconds|minutes|hours|days|months|years | min | max | infinite]` - Default Retention Period

Specifies the default retention period that is applied to files while committing to WORM state without an associated retention period.

If this option value is *min*, then minimum-retention-period is used as the default retention period. If this option value is *max*, then maximum-retention-period is used as the default retention period. If this option value is *infinite*, then a retention period that never expires will be used as the default retention period.

The retention period can also be explicitly specified as a number followed by a suffix. The valid suffixes are seconds, minutes, hours, days, months, and years. For example, a value of 6months represents a retention period of 6 months. The maximum valid retention period is 70 years.

`[-maximum-retention-period <integer> seconds|minutes|hours|days|months|years | infinite]` - Maximum Retention Period

Specifies the maximum allowed retention period for files committed to WORM state on the volume. Any files committed with a retention period longer than this maximum value, is assigned this maximum value.

If this option value is *infinite*, then files that have retention period that never expires might be committed to the volume.

Otherwise, the retention period is specified as a number followed by a suffix. The valid suffixes are seconds, minutes, hours, days, months, and years. For example, a value of 6months represents a retention period of 6 months. The maximum allowed retention period is 70 years. This option is not applicable while extending retention period of an already committed WORM file.

`[-autocommit-period <integer> minutes|hours|days|months|years | none]` - Autocommit Period

Specifies the autocommit period for SnapLock volume. All files which are not modified for a period greater the autocommit period of the volume are committed to WORM state.

The autocommit period option is specified as a number followed by a suffix. The valid suffixes for autocommit period are hours, minutes, days, months and years. For example, a value of 2hours represents an autocommit period of 2 hours. The minimum allowed autocommit period is 5 minutes and the maximum allowed autocommit period is 10 years.

If this option value is *none*, then autocommit is disabled on the SnapLock volume.

`[-is-volume-append-mode-enabled {true|false}]` - Is Volume Append Mode Enabled

Specifies if the volume append mode is enabled or disabled.

It can be modified only when the volume is not mounted and does not have any data or Snapshot copies.

The volume append mode is not supported on SnapLock audit log volumes.

When it is enabled, all the files created with write permissions on the volume are WORM appendable files by default. All the WORM appendable files that are not modified for a period greater than the autocommit period of the volume are also committed to the WORM read-only state.

If it is set to *true*, then the volume append mode is enabled.

If it is set to *false*, then the volume append mode is disabled.

Volume append mode is disabled by default when the volume is created.

| **[-privileged-delete {disabled|enabled|permanently-disabled}]] - Privileged Delete**

Specifies the privileged-delete attribute of a SnapLock volume. This parameter must be specified alone.

If it is set to *enabled* then the privileged-delete operation can be performed using the “[volume file privileged-delete](#)” on [page 1404](#) command.

If it is set to *disabled*, then the privileged-delete operation is not supported.

Once it is set to *permanently-disabled*, then neither the privileged-delete operation nor any change in the volume privileged-delete attribute is permitted.

Examples

The following command sets `-default-retention-period` of a given SnapLock volume:

```
cluster1::> volume snaplock modify -volume vol_slc -default-retention-period 2years
cluster1::>
```

The following command sets `-maximum-retention-period` of a given SnapLock volume to *infinite*:

```
cluster1::> volume snaplock modify -volume vol_slc -maximum-retention-period infinite
cluster1::>
```

The following command enables the privileged-delete operation on a SnapLock volume.

```
cluster1::> volume snaplock modify -vserver vs1 -volume vol_slc -privileged-delete enabled
[Job 38] Job succeeded: Privileged-delete Attribute Change for Volume "vs1:vol_slc" Completed.
cluster1::>
cluster1::> volume snaplock show -vserver vs1 -volume vol_slc -fields privileged-delete
vserver volume    privileged-delete
-----
vs1      vol_slc    enabled
cluster1::>
```

volume snaplock prepare-to-downgrade

Prepares the system for downgrade

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `volume snaplock prepare-to-downgrade` command prepares nodes to downgrade to a release without SnapLock volume append mode feature. Prior to disabling the feature, the command disables volume append mode on all SnapLock volumes in the cluster.

Examples

The following example disables the SnapLock volume append mode feature in the local cluster:

```
cluster1::> volume snaplock prepare-to-downgrade
```

volume snaplock show

Display SnapLock attributes of a SnapLock volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snaplock show` command displays following information :

- Vserver name
- Volume name
- SnapLock Type of the volume
- Minimum retention period applicable of the volume
- Default retention period applicable of the volume
- Maximum retention period applicable of the volume
- Autocommit period of the volume
- Volume Append Mode attribute of the volume
- Privileged Delete attribute of the volume
- Litigation count on the volume
- Volume expiry time of the volume
- Volume ComplianceClock
- SnapLock audit log volume

This command is applicable only for SnapLock volumes.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If this parameter is specified, the command displays information for all the SnapLock volumes that match the specified `-vserver` value.

[-volume <volume name>] - Volume

If this parameter is specified, the command displays information for the specified `-volume` value.

[-type {non-snaplock|compliance|enterprise}] - SnapLock Type

If this parameter is specified, the command displays all the volumes that match the specified `-type` value.

`[-minimum-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Minimum Retention Period`

If this parameter is specified, the command displays all the volumes that match the specified `-minimum-retention-period` value.

`[-default-retention-period {{<integer> seconds|minutes|hours|days|months|years} | min | max | infinite}] - Default Retention Period`

If this parameter is specified, the command displays all the volumes that match the specified `-default-retention-period` value.

`[-maximum-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Maximum Retention Period`

If this parameter is specified, the command displays all the volumes that match the specified `-maximum-retention-period` value.

`[-autocommit-period {{<integer> minutes|hours|days|months|years} | none}] - Autocommit Period`

If this parameter is specified, the command displays all the volumes that match the specified `-autocommit-period` value.

`[-is-volume-append-mode-enabled {true|false}] - Is Volume Append Mode Enabled`

If this parameter is specified, the command displays all the volumes that match the specified `-is-volume-append-mode-enabled` value.

`[-privileged-delete {disabled|enabled|permanently-disabled}] - Privileged Delete`

If this parameter is specified, the command displays all the volumes that match the specified `-privileged-delete` value.

`[-expiry-time <text>] - Expiry Time`

If this parameter is specified, the command displays all the volumes that match the specified `-expiry-time` value.

`[-compliance-clock-time <text>] - ComplianceClock Time`

If this parameter is specified, the command displays all the volumes that match the specified `-compliance-clock-time` value.

`[-litigation-count <integer>] - Litigation Count`

If this parameter is specified, the command displays all the volumes that match the specified `-litigation-count` value.

`[-is-audit-log-volume {true|false}] - Is SnapLock Audit Log Volume`

If this parameter is specified, the command displays all the volumes that match the specified `-is-audit-log-volume` value.

Examples

The following command shows summary of SnapLock volumes on a vservers:

```
cluster1::> volume snaplock show
Vserver      Volume      SnapLock Type ComplianceClock Time
-----
vs1          vol_slc     compliance  Mon Jan 19 14:12:34 IST 2015 +05:30
vs1          vol_sle     enterprise  Mon Jan 19 14:12:34 IST 2015 +05:30
2 entries were displayed.

cluster1::>
```

The following commands lists the complete SnapLock attributes of two given SnapLock volumes:

```
cluster1::> volume snaplock show -vserver vs1 -volume vol_slc
```

```

Vserver Name: vs1
Volume Name: vol_slc
SnapLock Type: compliance
Minimum Retention Period: 1 years
Default Retention Period: max
Maximum Retention Period: 30 years
Autocommit Period: 12 hours
Is Volume Append Mode Enabled: false
Privileged Delete: permanently-disabled
Expiry Time: Thu May 11 14:37:21 GMT 2017
ComplianceClock Time: Wed May 11 20:08:41 IST 2016 +05:30
Litigation Count: 0
Is SnapLock Audit Log Volume: false

cluster1::>

cluster1::> volume snaplock show -vserver vs1 -volume vol_slc

```

```

Vserver Name: vs1
Volume Name: vol_sle
SnapLock Type: enterprise
Minimum Retention Period: 6 months
Default Retention Period: min
Maximum Retention Period: infinite
Autocommit Period: none
Is Volume Append Mode Enabled: false
Privileged Delete: enabled
Expiry Time: infinite
ComplianceClock Time: Wed May 11 20:08:44 IST 2016 +05:30
Litigation Count: 0
Is SnapLock Audit Log Volume: false

```

volume snapshot commands

Manage snapshots

The `volume snapshot` command enables you to manage volume Snapshot copies.

volume snapshot compute-reclaimable

Calculate the reclaimable space if specified snapshots are deleted

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot compute-reclaimable` command calculates the volume space that can be reclaimed if one or more specified Snapshot copies are deleted.

The command heavily uses system's computational resources so it can reduce the performance for client requests and other system processes. Therefore, the queries that use query operators (*, |, etc.), are disabled for this command. You should not specify more than three Snapshot copies per query. Snapshot copies must be specified as a comma-separated list with no spaces after the commas.

This command is not supported on Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This specifies the volume for which reclaimable space is to be calculated.

-snapshots <snapshot name>, ... - List of Snapshots

This specifies one or more than one Snapshot copies that are to be considered for deletion. If you list more than one Snapshot copy, specify a comma-separated list with no spaces after the commas.

Examples

The following example calculates the space that can be reclaimed if the Snapshot copy named hourly.2008-01-10_1505 is deleted on a volume named vol3, which is a part of the Vserver named vs0:

```
cluster1::> volume snapshot compute-reclaimable -vserver vs0  
-volume vol3 -snapshots hourly.2008-01-10_1505
```

volume snapshot create

Create a snapshot

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot create` command creates a Snapshot copy of a specified volume.

Parameters

-vserver <vserver name> - Vserver

This specifies the Vserver that contains the volume on which the snapshot is to be created.

-volume <volume name> - Volume

This specifies the volume where a Snapshot copy is to be created.

-snapshot <snapshot name> - Snapshot

This specifies the name of the Snapshot copy that is to be created.

[-comment <text>] - Comment

This optionally specifies a comment for the Snapshot copy.

[-foreground {true|false}] - Foreground Process

If you use this option and select *false*, the Snapshot copy creation process runs in the background. If you use this option and select *true*, the Snapshot copy creation process runs in the foreground. This option applies only to Infinite Volumes, and is ignored for other volumes. The default is *true*.

[-snapmirror-label <text>] - Label for SnapMirror Operations

If you specify this option, the Snapshot copy is created with the SnapMirror Label that you specify. If this option is not specified, the Snapshot copy is created with no SnapMirror Label. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

[-expiry-time <MM/DD/YYYY HH:MM:SS>] - Expiry Time

If you specify this option, the Snapshot copy is created with the expiry time that you specify. The expiry time indicates the time at which the Snapshot copy becomes eligible for deletion.

Examples

The following example creates a Snapshot copy named vol3_snap on a volume named vol3 on a Vserver named vs0. The Snapshot copy is given the comment "Single snapshot" and the operation runs in the background.

```
cluster1::> volume snapshot create -vserver vs0 -volume vol3 -snapshot vol3_snapshot -comment "Single snapshot" -foreground false
```

volume snapshot delete

Delete a snapshot

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot delete` command deletes a Snapshot copy from a specified volume.

Parameters

-vserver <vserver name> - Vserver

This specifies the Vserver that contains the volume on which the specified Snapshot copy is saved.

-volume <volume name> - Volume

This specifies the volume from which a Snapshot copy is to be deleted.

-snapshot <snapshot name> - Snapshot

This specifies the Snapshot copy that is to be deleted.

[-foreground {true|false}] - Foreground Process

If you use this option and set it to *false*, the delete operation runs as a background process. If you specify this option and set it to *true*, the operation runs as a foreground process. This option applies only to Infinite Volumes, and is ignored for other volumes. The default is *true*.

[-force [true]] - Force Delete (privilege: advanced)

If you use this switch, the Snapshot copy is immediately deleted without generating any confirmation messages. If you do not use this option the operation generates confirmation messages and the operation is disallowed on application tagged volumes. Passing in a value of *true* is supported, but not required. The `force` switch is typically used for scripting applications where users cannot directly confirm the delete operation.

[-ignore-owners [true]] - Ignore Snapshot Owners (privilege: advanced)

If you use this switch, the command ignores other processes that might be accessing the Snapshot copy. If you do not use this option the operation exhibits default behavior and checks the owners tags before allowing the deletion to occur. Passing in a value of *true* is supported, but not required.

Examples

The following example deletes a Snapshot copy named `vol3_daily` from a volume named `vol3` on a Vserver named `vs0`:

```
cluster1::> volume snapshot delete -vserver vs0 -volume vol3 -snapshot vol3_daily
```

volume snapshot modify

Modify snapshot attributes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot modify` command enables you to change the text comment associated with a Snapshot copy.

This command is not supported on Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver

This specifies the Vserver that contains the volume on which the specified Snapshot copy is saved.

-volume <volume name> - Volume

This specifies the volume whose Snapshot copy is to be modified.

-snapshot <snapshot name> - Snapshot

This specifies the Snapshot copy whose text comment is to be modified.

[-comment <text>] - Comment

This specifies the new comment for the Snapshot copy.

[-snapmirror-label <text>] - Label for SnapMirror Operations

This specifies the SnapMirror Label for the Snapshot copy. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination. If an empty label ("") is specified, the existing label will be deleted.

[-expiry-time <MM/DD/YYYY HH:MM:SS>] - Expiry Time

This specifies the expiry time for the Snapshot copy. The expiry time indicates the time at which the Snapshot copy becomes eligible for deletion. If an expiry time of ("0") is specified, the existing expiry time will be deleted.

Examples

The following example modifies the comment of a Snapshot copy named vol3_snapshot of a volume named vol3 on a Vserver named vs0. The comment is changed to "Pre-upgrade snapshot".

```
cluster1::> volume snapshot modify -vserver vs0 -volume vol3
-snapshot vol3_snapshot -comment "Pre-upgrade snapshot"
```

volume snapshot modify-snaplock-expiry-time

Modify expiry time of a SnapLock Snapshot copy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot modify-snaplock-expiry-time` extends snaplock expiry time of an existing Snapshot copy.

Parameters

-vserver <vserver name> - Vserver

This specifies the Vserver that contains the volume on which the Snapshot copy is located.

-volume <volume name> - Volume

This specifies the volume where a Snapshot copy is to be located.

-snapshot <text> - Snapshot

This specifies the name of the Snapshot copy locked by SnapLock whose snaplock expiry time needs to be modified.

[-expiry-time {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm] | infinite}] - SnapLock Expiry Time

Specifies the new snaplock expiry that is applied to Snapshot copy locked by SnapLock.

If this option value is *infinite*, then a retention period that never expires is applied to the Snapshot copy.

Examples

The following example extends the retention period of a Snapshot copy *snap1* to "03/03/2020 00:00:00":

```
cluster1::> volume snapshot modify-snaplock-expiry-time -vserver vs1 -volume vol1 -snapshot snap1 -expiry-time "03/03/2020 00:00:00"
cluster1::>
```

The following example extends the retention period of a Snapshot copy *snap2* to *infinite*:

```
cluster1::> volume snapshot modify-snaplock-expiry-time -vserver vs1 -volume vol1 -snapshot snap2 -expiry-time infinite
cluster1::>
```

```
cluster1::> volume snapshot show -vserver vs1 -fields snaplock-expiry-time
vserver volume snapshot snaplock-expiry-time
-----
vs1      vol1    snap1    3/3/2020 00:00:00 +05:30
vs1      vol1    snap2    infinite
```

volume snapshot partial-restore-file

Restore part of a file from a snapshot

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot partial-restore-file` command enables you to restore a range of bytes in a file from the version of the file saved in the Snapshot copy. This command is intended to be used to restore particular pieces of LUNs and NFS or CIFS container files that are used by a host to store multiple sources of data. For example, a host may be storing multiple user databases in the same LUN. A partial file restore can be used to restore one of those databases in the LUN without touching other databases stored in the LUN. This command is not intended for restoring parts of normal user-level files that are stored in the volume. You should use “[volume snapshot restore-file](#)” on [page 1493](#) command to restore normal user-level files. The volume for the partial-restore should be online during this operation.

This command is not supported on Infinite Volumes or on NVMe namespaces.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver which contains the volume.

[-volume <volume name>] - Volume Name

This specifies the volume in which the Snapshot copy is saved.

-snapshot | -s <snapshot name> - Snapshot Name

This specifies the Snapshot copy which contains the version of file from which a range of bytes is restored. The source file must be present in the Snapshot copy.

-path <text> - Filepath

This specifies the relative path to the file which is partially restored from the Snapshot copy. You should specify the `-volume` option so that the file is searched and restored from the Snapshot copy of the specified volume. If you do not specify the `-volume` then the file is searched and restored from the Snapshot copy of the root volume. The destination file must be present in the active file system.

-start-byte <integer> - Starting Byte Offset (Multiple of 4096)

This specifies the starting byte offset in the file to partially restore. The first byte of the file is byte zero. The start byte must be a multiple of 4096. In addition, the start byte must not exceed the size of the source or destination file.

-byte-count <integer> - Number of Bytes to Restore (Multiple of 4096)

This specifies the total number of bytes to restore, beginning at the `-start-byte` value. The `-byte-count` option must be a multiple of 4096. The maximum number of bytes that can be restored is 16 MB. The byte count must not exceed the range of the source or destination file.

Examples

The following example restores first 4096 bytes in the file `foo.txt` inside the volume `vol3` from the Snapshot copy `vol3_snap`:

```
cluster1::> volume snapshot partial-restore-file -vserver vs0 -volume vol3
-snapshot vol3_snap -volume vol3 -path /foo.txt -start-byte 0 -byte-count 4096
```

volume snapshot prepare-for-revert

Deletes multiple Snapshot copies of the current File System version.

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command will delete all Snapshot copies that have the format used by the current version of Data ONTAP. It will fail if any Snapshot copy policies are enabled, or if any Snapshot copies have an owner.

Note: Snapshot policies must be disabled prior to running this command.

Parameters

-node <nodename> - Node

The name of the node.

Examples

The following example prepares the Snapshot copies for revert.

```
cluster1::> volume snapshot prepare-for-revert -node node1
```

volume snapshot rename

Rename a snapshot

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot rename` command renames a Snapshot copy.

Note: You cannot rename a Snapshot copy that is created as a reference copy during the execution of the [“volume move” on page 1428](#) command.

This command is not supported on Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver

This specifies the Vserver that contains the volume on which the specified Snapshot copy is to be renamed

-volume <volume name> - Volume

This specifies the volume that contains the Snapshot copy to be renamed.

-snapshot <snapshot name> - Snapshot

This specifies the Snapshot copy that is to be renamed.

-new-name <snapshot name> - Snapshot New Name

This specifies the new name for the Snapshot copy.

[-force [true]] - Force Rename (privilege: advanced)

If this parameter is specified, the Snapshot copy rename operation is allowed on application tagged volumes. Otherwise, the operation is disallowed on application tagged volumes.

Examples

The following example renames a Snapshot copy named `vol3_snap` on a volume named `vol3` and a Vserver named `vs0`. The Snapshot copy is renamed to `vol3_snap_archive`.

```
cluster1::> volume snapshot rename -vserver vs0 -volume vol3  
-snapshot vol3_snap -new-name vol3_snap_archive
```

volume snapshot restore

Restore the volume to a snapshot.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot restore` command restores a Snapshot copy to be the read-write parent volume for the volume family. This replaces the current working copy of the volume with the Snapshot copy that results in a loss of all changes made since the Snapshot copy was created.

Note: You should manually update all the SnapMirror relationships of a volume immediately after you restore its Snapshot copy. Not doing so can result in unusable SnapMirror relationships that must be deleted and re-created. Before running this command on an Infinite Volume, unmount the volume. Any namespace mirror constituents present in the system are resynchronized to the restored Snapshot copy.

After the restore is complete, the size of the flexible volume will be set to either the current volume size or the snapshot size - whichever is greater.

Parameters

-vserver <vserver name> - Vserver

This specifies the Vserver that contains the volume on which the specified Snapshot copy to be restored is saved.

-volume <volume name> - Volume

This specifies the parent read-write volume whose Snapshot copy is to be restored to take its place.

-snapshot <snapshot name> - Snapshot

This specifies the Snapshot copy that is to be restored to be the read-write parent volume.

[-force [true]] - Force Restore

If you use this parameter, the Snapshot copy is restored even if the volume has one or more newer Snapshot copies which are currently used as reference Snapshot copy by SnapMirror. If a restore is done in this situation, this will cause future SnapMirror transfers to fail. The SnapMirror relationship may be repaired using [“snapmirror resync” on page 622](#) command if a common Snapshot copy is found between the source and destination volume. If there is no common Snapshot copy between the source and the destination volume, a baseline SnapMirror copy would be required. If you use this parameter, the operation is also allowed on application tagged volumes.

[-preserve-lun-ids {true|false}] - Preserve LUN Identifiers

This option enables you to select whether the Snapshot copy restore needs to be non-disruptive to clients due to LUN or NVMe namespace identifiers changing. If you use this option and set it to *true*, or choose to not use this option at all, the `volume snapshot restore` command fails if the system determines that it cannot be non-disruptive with regards to LUN or NVMe namespace identifiers. If you use this option and set it to *false*, the restore operation proceeds even if this might cause client-visible effects. In this case, administrators should take the LUNs or NVMe namespaces offline before proceeding.

Examples

The following example restores a Snapshot copy named `vol3_snap_archive` to be the parent read-write volume for the volume family. The existing read-write volume is named `vol3` and is located on a Vserver named `vs0`:

```
cluster1::> volume snapshot restore -vserver vs0 -volume vol3
-snapshot vol3_snap_archive
```

volume snapshot restore-file

Restore a file from a snapshot

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot restore-file` command enables you to restore a single file to a version saved in the Snapshot copy. You can restore a file over an existing copy of the file in the parent read-write volume or to a different location within the same parent read-write volume. If the destination file for the restore operation does not exist, a new file is created with the same version as the one saved in the Snapshot copy. If the destination file for the restore operation exists, then it is overwritten by the version from the Snapshot copy. This operation is used to restore normal user-level files, LUNs and NVMe namespaces. The command also supports restoring normal user-level files with streams. The command fails if you try to restore directories (and their contents). During the restore operation the parent read-write volume should remain online. The command fails if the destination path for the restore operation is in a different volume than the source volume.

This command is not supported on Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver which contains the volume.

[-volume <volume name>] - Volume Name

This specifies the volume which contains the specified Snapshot copy.

-snapshot | -s <snapshot name> - Snapshot Name

This specifies the Snapshot copy from which the file is restored.

-path <text> - Filepath

This specifies the relative path to the file which is restored from the Snapshot copy. You should specify the `-volume` option so that the file is searched and restored from the Snapshot copy of the specified volume. If you do not specify the `-volume` then the file is searched and restored from the Snapshot copy of the root volume.

[-restore-path | -r <text>] - Restore Filepath

This option specifies the destination location inside the volume where the file is restored. If you do not specify this option, the file is restored at the same location referred by `-path` option. If you specify `-restore-path` option, then it should refer to a relative path location within the same volume which contains the source file. If you do not specify `-volume` along with the relative path, the file is restored in the root volume.

[-split-disabled [true]] - Disable Space Efficient LUN Splitting

If you use this option and set it to *true*, space efficient LUN or NVMe namespace clone split is not allowed during the restore operation. If you use this option and set it to *false* or do not use this option, then space efficient LUN or NVMe namespace clone split is allowed during the restore operation.

[-ignore-streams [true]] - Ignore Streams

If you use this parameter, the file is restored without its streams. By default, the streams are restored.

Examples

The following example restores a file *foo.txt* from the Snapshot copy *vol3_snap* inside the volume *vol3* contained in a Vserver *vs0*:

```
cluster1::> volume snapshot restore-file -vserver vs0 -volume vol3 -snapshot vol3_snap -path /foo.txt
```

volume snapshot show

Display a list of snapshots

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot show` command displays information about Snapshot copies. The command output depends on the parameters specified with the command. If no parameters are specified, the command displays a table with the following information about all the available Snapshot copies:

- Vserver name
- Volume name
- Snapshot copy name
- State
- Size
- Percentage of total blocks in the parent volume
- Percentage of used blocks in the parent volume

To display a detailed list view with additional information, run the command and select the `-instance` view. In addition to the above mentioned information about the Snapshot copies, the detailed list view provides the following additional information:

- Creation time
- Snapshot busy
- List of the Snapshot copy's owners
- Comment associated with the Snapshot copy
- SnapMirror Label associated with the Snapshot copy
- 7-Mode Snapshot
- Constituent Snapshot
- Expiry Time
- SnapLock Expiry Time

At the advanced or higher privilege level the detailed view provides the following additional information:

- Snapshot copy's Dataset ID
- Snapshot copy's master Dataset ID
- Number of consistency points in the Snapshot copy
- Internal status of the Snapshot copy
- File system version
- File system block format
- Physical Snap ID
- Logical Snap ID
- Database record owner
- Snapshot tags
- Instance UUID
- Version UUID
- Node
- AFS used size
- Compression savings size
- Deduplication savings size
- Vbn0 savings size

- Status of FlexGroup Qtree support in the Snapshot copy

Notes: For Snapshot copies whose parent volume is a FlexGroup, some information is not available and empty values will be displayed. This information includes:

- State
- Size
- Percentage of total blocks in the parent volume
- Percentage of used blocks in the parent volume

All information is available for Snapshot copies whose parent volume is a FlexGroup Constituent. At the admin and advanced privilege level, Snapshot copies whose parent volume is a FlexGroup Constituent are not displayed by default. To display these, run the command and set the `is-constituent` to `true`. At the diagnostic or higher privilege level, all Snapshot copies are displayed by default.

The list view is automatically enabled if a single Snapshot copy is specified by using the `-vserver`, `-volume` and `-snapshot` options together.

A preformatted query for displaying the time-related information is available by specifying the `-time` format specifier. This displays a table that contains the following fields for all the available Snapshot copies:

- Vserver name
- Volume name
- Snapshot copy name
- Creation time

By using the `-fields` option you can choose to print only the certain fields in the output. This presents the selected fields in a table view. This is ideal when you want additional information to be different from the information that is provided by the default table view, but would like it in a format which is visually easy to compare.

You can specify additional parameters to display the information that matches only those parameters. For example, to display information only about Snapshot copies of the load-sharing volumes, run the command with the `-volume-type LS` parameter. If you specify multiple filtering parameters, only those Snapshot copies that match all the specified parameters are displayed.

Parameters

[`-fields <fieldname>`, ...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-time`]

If the `-time` format is specified, the command displays time related information about all entries.

[`-instance`]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-vserver <vserver name>`] - Vserver

If you use this parameter, the Snapshot copies located only on the specified Vserver will be displayed.

[`-volume <volume name>`] - Volume

If you use this parameter only Snapshot copies located on the specified volume will be displayed.

[`-snapshot <snapshot name>`] - Snapshot

If you use this parameter only Snapshot copies matching the specified name will be displayed.

[`-dsid <integer>`] - Snapshot Data Set ID (privilege: advanced)

If this parameter is specified, the command displays information only about the Snapshot copy that has the specified data set ID.

[-msid <integer>] - Snapshot Master Data Set ID (privilege: advanced)

If this parameter is specified, the command displays information only about the Snapshot copy that has the specified master data set ID.

[-create-time <Date>] - Creation Time

If this parameter is specified, the command displays information only about the Snapshot copies that match the specified creation time.

[-busy {true|false}] - Snapshot Busy

If this parameter is specified, the command displays information only about the Snapshot copies that have the specified busy status.

[-owners <text>, ...] - List of Owners

If this parameter is specified, the command displays information only about the Snapshot copies that are owned by the specified list of owners.

[-size {<integer>[KB|MB|GB|TB|PB]}] - Snapshot Size

If this parameter is specified, the command displays information only about the Snapshot copies that have the specified size. The size is specified as a character specifying the unit of measurement followed by a number specifying the size in the mentioned unit of measurement: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit of measurement is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. You may also use an inequality such as *>10 MB* as input.

[-blocks <percent>] - Percentage of Total Blocks

If this parameter is specified, the command displays information only about the Snapshot copies that have the specified percentage of total blocks on their parent volumes. You may also use an inequality such as *>10* as input.

[-usedblocks <percent>] - Percentage of Used Blocks

If this parameter is specified, the command displays information only about the Snapshot copies that have the specified percentage of used blocks on their parent volumes. You may also use an inequality such as *>10* as input.

[-cpcount <integer>] - Consistency Point Count (privilege: advanced)

If this parameter is specified, the command displays information only about the Snapshot copies that have the specified number of consistency points. You may also use an inequality such as *<100* as input.

[-comment <text>] - Comment

If this parameter is specified, the command displays information only about the Snapshot copies that have the specified comment text. You may also specify an inequality such as *!"-"* as input.

[-fs-version <text>] - File System Version (privilege: advanced)

If you use this parameter the only Snapshot copies displayed are those that were created when the file system was of a specific release. This parameter is helpful especially when you need to upgrade to newer software release and want to know the Snapshot copies that will be impacted by the upgrade process.

[-is-7-mode {true|false}] - 7-Mode Snapshot

If you use this parameter only those Snapshot copies which have the specified value are shown. This value is *true* for the Snapshot copies that exist on the volume that was in 7-mode configuration and then transitioned to a clustered configuration. In such a scenario, the volume is in a clustered configuration and the existing Snapshot copies are still in the 7-mode configuration.

[-snapmirror-label <text>] - Label for SnapMirror Operations

If you use this parameter, only those Snapshot copies that have the specified SnapMirror Label value are shown.

[-state {valid|invalid|partial}] - Snapshot State

If you use this parameter only those Snapshot copies which have the specified state will be shown.

[-is-constituent {true|false}] - Constituent Snapshot

If you use this parameter, only those Snapshot copies whose parent volume is a constituent volume of a FlexGroup or an Infinite Volume will be shown.

[-node <nodename>] - Node (privilege: advanced)

If you use this parameter only those Snapshot copies that are located on the specified storage system are shown.

[-inofile-version <integer>] - Snapshot Infile Version (privilege: advanced)

If this parameter is specified, the command displays information only about the Snapshot copies whose inode files are at the specified version.

[-expiry-time <MM/DD/YYYY HH:MM:SS>] - Expiry Time

If you use this parameter only those Snapshot copies that have the specified expiry time are shown.

[-compression-type {none|secondary|adaptive}] - Compression Type (privilege: advanced)

If you use this parameter only those Snapshot copies that have the specified compression type are shown.

[-snaplock-expiry-time {MM/DD/YYYY HH:MM:SS [[+|-]hh:mm] | infinite}] - SnapLock Expiry Time

If you use this parameter only those Snapshot copies that have the specified snaplock expiry time are shown.

[-application-io-size {default|8K|16K|32K}] - Application IO Size (privilege: advanced)

If you use this parameter only those Snapshot copies that have the specified application IO size are shown.

[-is-flexgroup-qtree-enabled {true|false}] - Is FlexGroup Qtree Support Enabled (privilege: advanced)

If you use this parameter only those Snapshot copies that have the specified FlexGroup Qtree support status are shown.

Examples

The following example displays default information about all Snapshot copies of a volume named vol1:

```
cluster1::> volume snapshot show -volume vol1
```

Vserver	Volume	Snapshot	---Blocks---		
			Size	Total%	Used%
cluster1	vol1				
		one	68KB	0%	33%
		two	72KB	0%	34%

2 entries were displayed.

The following example displays Snapshot copies which are older than 1 hour, limiting the output to wanted fields:

```
cluster1:: volume snapshot show -create-time more than 1h -fields create-time, size
vserver volume snapshot create-time size
```

cluster1	vol1	one	Mon Nov 17 10:23:42 2014	68KB
cluster1	vol1	two	Mon Nov 17 10:23:44 2014	72KB

2 entries were displayed.

The following example displays detailed information about a specific Snapshot copy, using the 'snap' alias:

```
cluster1:: snap show -volume vol1 -snapshot one -instance
```

```

Vserver: cluster1
Volume: vol1
Snapshot: one
Snapshot Data Set ID: 4294968322
Snapshot Master Data Set ID: 6442451970
Creation Time: Mon Nov 17 10:23:42 2014
Snapshot Busy: false
List of Owners: -
Snapshot Size: 68KB
Percentage of Total Blocks: 0%
Percentage of Used Blocks: 33%
```

```

Consistency Point Count: 4
      Comment: -
      File System Version: 9.0
      7-Mode Snapshot: false
Label for SnapMirror Operations: -
      Constituent Snapshot: false
      Node: node1
Snapshot Inofile Version: 3
      Expiry Time: -
SnapLock Expiry Time: -

```

volume snapshot show-delta

Computes delta between two Snapshot copies

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot show-delta` command returns the number of bytes that changed between two Snapshot copies or a Snapshot copy and the active filesystem. This is calculated from the number of blocks that differ multiplied by the block size. The command also shows the time elapsed between the Snapshot copies in seconds.

Queries that use query operators (*, !, etc.) are disabled for this command to avoid performance degradation for client requests.

This command is not supported on Infinite Volumes.

Parameters

-vserver <*vserver name*> - **Vserver Name**

This specifies the Vserver on which the volume is located.

-volume <*volume name*> - **Volume Name**

This specifies the volume for which the delta is to be calculated.

-snapshot1 <*snapshot name*> - **First Snapshot Name**

This specifies the first Snapshot copy for the comparison.

[-snapshot2 <*snapshot name*>] - **Second Snapshot Name**

This specifies the second Snapshot copy for the comparison. If the field is not specified, it is assumed to be the Active File System.

Examples

The following example shows the bytes changed and the time separating the two Snapshots copies:

```

cluster1::> volume snapshot show-delta -vserver vs0 -volume vol2 -snapshot1 one snapshot2 two
A total of 139264 bytes (34 blocks) are different. Elapsed time between the Snapshot copies: 1s.

```

volume snapshot autodelete commands

Manage snapshot autodelete settings

The `volume snapshot autodelete` command enables you to manage the Snapshot autodelete settings.

volume snapshot autodelete modify

Modify autodelete settings

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot autodelete modify` command enables you to modify Snapshot autodelete and LUN, NVMe namespace or file clone autodelete policy settings. Based on the defined policy, automatic deletion of Snapshot copies and LUN, NVMe namespace or file clones is triggered. Automatic deletion of Snapshot copies and LUN, NVMe namespace or file clones is useful when you want to automatically reclaim space consumed by the Snapshot copies and LUN, NVMe namespace or file clones from the volume when it is low in available space. LUN, NVMe namespace or file clone autodelete follows Snapshot copy autodelete. This command works only on a read-write parent volume. You cannot setup automatic Snapshot copy deletion and automatic LUN, NVMe namespace or file clone deletion for Infinite Volumes and read-only volumes.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This specifies the volume whose autodelete policy has to be modified.

[-enabled {true|false}] - Enabled

This option specifies whether automatic deletion of Snapshot copies and LUN, NVMe namespace or file clones is enabled or disabled. If set to *true*, automatic deletion of Snapshot copies and LUN, NVMe namespace or file clones is enabled. If set to *false*, automatic deletion of Snapshot copies and LUN, NVMe namespace or file clones is disabled.

[-commitment {try|disrupt|destroy}] - Commitment

This option specifies which Snapshot copies and LUN, NVMe namespace or file clones can be automatically deleted to reclaim back space. When set to *try*, the Snapshot copies which are not locked by any application and the LUN, NVMe namespace or file clones which are not configured as preserved are deleted. When set to *disrupt*, the Snapshot copies which are not locked by data backing functionalities (such as volume clones, LUN clones, NVMe namespace clones and file clones) and LUN, NVMe namespace or file clones which are not configured as preserved are deleted. In the *disrupt* mode, the Snapshot copies locked by data protection utilities such as Snapmirror and Volume Move can be deleted. If such a locked Snapshot copy is deleted during the data transfer, the transfer is aborted. When set to *destroy*, the Snapshot copies locked by the data backing functionalities are deleted. In addition, all the LUN, NVMe namespace or file clones in the volume are deleted.

[-defer-delete {scheduled|user_created|prefix|none}] - Defer Delete

This option determines the order in which Snapshot copies can be deleted. Possible values are as follows:

- When set to *scheduled*, scheduled Snapshot copies are the last to be deleted.
- When set to *user_created*, user Snapshot copies are the last to be deleted.
- When set to *prefix*, Snapshot copies matching a certain prefix are the last to be deleted.
- When set to *none*, no defer deletion order is honored.

This option is not applicable for LUN, NVMe namespace or file clones.

[-delete-order {newest_first|oldest_first}] - Delete Order

This option specifies if the oldest Snapshot copy and the oldest LUN, NVMe namespace or file clone or the newest Snapshot copy and the newest LUN, NVMe namespace or file clone are deleted first.

[-defer-delete-prefix <text>] - Defer Delete Prefix

This option specifies the prefix string for the `-defer-delete prefix` parameter. The option is not applicable for LUN, NVMe namespace or file clones.

[-target-free-space <percent>] - Target Free Space

This option specifies the free space percentage at which the automatic deletion of Snapshot copies and LUN, NVMe namespace or file clones must stop. Depending on the `-trigger` Snapshot copies and LUN, NVMe namespace or file clones are deleted until you reach the target free space percentage.

[-trigger {volume|snap_reserve|(DEPRECATED)-space_reserve}] - Trigger

This option specifies the condition which starts the automatic deletion of Snapshot copies and LUN, NVMe namespace or file clones. Setting this option to *volume* triggers automatic deletion of Snapshot copies and LUN, NVMe namespace or file clones when the volume reaches threshold capacity and the volume space reserved for Snapshot copies is exceeded. Setting the option to *snap_reserve* triggers automatic deletion of Snapshot copies and LUN, NVMe namespace or file clones when the space reserved for Snapshot copies reaches threshold capacity. Setting the option to (DEPRECATED)-*space_reserve* triggers automatic deletion of Snapshot copies when reserved space in the volume reaches threshold capacity and the volume space reserved for Snapshot copies is exceeded.

Note: The option *space_reserve* is deprecated.

The threshold capacity is determined by the size of the volume as follows:

- If the volume size is less than 20 GB, the autodelete threshold is 85%.
- If the volume size is equal to or greater than 20 GB and less than 100 GB, the autodelete threshold is 90%.
- If the volume size is equal to or greater than 100 GB and less than 500 GB, the autodelete threshold is 92%.
- If the volume size is equal to or greater than 500 GB and less than 1 TB, the autodelete threshold is 95%.
- If the volume size is equal to or greater than 1 TB, the autodelete threshold is 98%.

[-destroy-list <text>] - Destroy List

This option specifies a comma separated list of data backing functions which are affected if the automatic deletion of the Snapshot copy backing that service is triggered. The possible values for this option are *lun_clone*, *fileclone*, *lun_clone,sfsr*, *vol_clone*, *cifs_share*, or *none*. Except *none*, all the other options can be combined as a comma separated list. Note that "lun_clone", "file_clone" and "sfsr" individually are not valid values. Only pairs "lun_clone,file_clone" and "lun_clone,sfsr" are supported.

Note: For the purposes of autodelete, *lun_clone* includes both LUNs and NVMe namespaces.

If you specify *vol_clone*, the cloned volume backed by the Snapshot copy is deleted. If you specify *lun_clone*, and a LUN or NVMe namespace is in the process of being cloned when autodelete is triggered, the cloning operation is aborted. Any access to this LUN or NVMe namespace will result in an error being reported to the client. If you specify *file_clone*, and the file cloning operation is in progress when autodelete is triggered, the cloning operation is aborted. Any access to this file will result in an error being reported to the client. If you specify *sfsr*, and the file restore is in progress when autodelete is triggered, the restore operation is aborted. If the Snapshot copy is locked either by a *lun_clone* or *file_clone* or both, the *-destroy-list* must be set to *lun_clone,file_clone*. If the Snapshot copy is locked either by a *lun_clone* or *sfsr* operation or both, the *-destroy-list* must be set to *lun_clone,file_clone*. The options *file_clone* and *sfsr* are equivalent to each other. If you set *-destroy-list* to *lun_clone,file_clone* and the Snapshot copy is backing a file clone or *sfsr* operation, both the operations are aborted. This is also the case when you set *-destroy-list* to *lun_clone,sfsr*. LUN, NVMe namespace or file clone autodelete is applicable only if *-destroy-list* contains *lun_clone* and *file_clone*.

Examples

The following example enables Snapshot autodelete and sets the trigger to *snap_reserve* for volume *vol3* which is part of the Vserver *vs0*:

```
cluster1::> volume snapshot autodelete modify -vserver vs0 -volume vol3 -enabled true -trigger snap_reserve
```

The following example enables Snapshot autodelete and LUN, NVMe namespace or file clone autodelete for volume *vol3* which is part of the Vserve *vs0*:

```
cluster1::> volume snapshot autodelete modify -vserver vs0 -volume vol3 -enabled true -trigger volume -commitment try -delete-order oldest
```

volume snapshot autodelete show

Display autodelete settings

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot autodelete show` command displays information about Snapshot autodelete policies. The command output depends on the parameters specified with the command. If no parameters are specified, the command displays a table with the following information about all the available Snapshot autodelete policies:

- Vserver name
- Volume name
- Option name
- Option value

To display a detailed list view with additional information, run the command and select the `-instance` view. The detailed list view provides the following information:

- Vserver name
- Volume name
- Enabled
- Commitment
- Defer Delete
- Delete Order
- Defer Delete Prefix
- Target Free Space
- Trigger
- Destroy List
- Is Constituent Volume

By using the `-fields` option you can choose to print only the certain fields in the output. This presents the selected fields in a table view. This is ideal when you want additional information to be different from the information that is provided by the default table view, but would like it in a format which is visually easy to compare.

You can specify additional parameters to display the information that matches only those parameters. For example, to display information only about Snapshot autodelete policies which are enabled, run the command with `-enabled true` parameter. If you specify multiple filtering parameters, only those policies that match all the specified parameters are displayed.

Parameters

{ **[-fields <fieldname>, ...]**

This option allows you to print only certain fields in the output.

| **[-instance]**

This option allows you to print a detailed list view.

[-vserver <vserver name>] - Vserver Name

If this parameter and the `-volume` parameter are specified, the command displays detailed autodelete policy information about the specified volume. If this parameter is specified by itself, the command displays autodelete policy information about volumes on the specified Vserver.

[-volume <volume name>] - Volume Name

If this parameter and the `-vserver` parameter are specified, the command displays detailed autodelete policy information about the specified volume. If this parameter is specified by itself, the command displays autodelete policy information about all volumes matching the specified name.

[-enabled {true|false}] - Enabled

If this parameter is specified, the command displays information about autodelete policies that match the specified parameter value.

[-commitment {try|disrupt|destroy}] - Commitment

If this parameter is specified, the command displays information about autodelete policies that match the specified commitment value.

[-defer-delete {scheduled|user_created|prefix|none}] - Defer Delete

If this parameter is specified, the command displays information about autodelete policies that match the specified defer deletion criterion.

[-delete-order {newest_first|oldest_first}] - Delete Order

If this parameter is specified, the command displays information about autodelete policies that match the specified deletion order.

[-defer-delete-prefix <text>] - Defer Delete Prefix

If this parameter is specified, the command displays information about autodelete policies that match the prefix used for deferring deletion.

[-target-free-space <percent>] - Target Free Space

If this parameter is specified, the command displays information about autodelete policies that match the specified target free space.

[-trigger {volume|snap_reserve|(DEPRECATED)-space_reserve}] - Trigger

If this parameter is specified, the command displays information about autodelete policies that match the specified trigger condition.

[-destroy-list <text>] - Destroy List

If this parameter is specified, the command displays information about autodelete policies that match the specified value.

[-is-constituent {true|false}] - Is Constituent Volume

If this parameter is specified, the command displays information about autodelete policies for the constituent volumes of Infinite Volumes.

Examples

The following example displays Snapshot autodelete policy settings for volume vol3 which is inside the Vserver vs0:

```
cluster1::> volume snapshot autodelete show -vserver vs0 -volume vol3
```

Vserver	Volume	Option Name	Option Value
vs0	vol3		
		Enabled	false
		Commitment	try
		Trigger	volume
		Target Free Space	20%
		Delete Order	oldest_first
		Defer Delete	user_created
		Defer Delete Prefix	(not specified)
		Destroy List	none

volume snapshot policy commands

Manage snapshot policies

The `volume snapshot policy` command enables you to manage Snapshot scheduling policies.

volume snapshot policy add-schedule

Add a schedule to snapshot policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot policy add-schedule` command adds a schedule to a Snapshot policy. You can create a schedule by using the [“job schedule cron create” on page 180](#) or [“job schedule interval create” on page 183](#) commands.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which a Snapshot policy schedule is to be added.

-policy <snapshot policy> - Snapshot Policy Name

This specifies the Snapshot policy to which a schedule is to be added.

-schedule <text> - Schedule Name

This specifies the schedule that is to be added to the Snapshot policy.

-count <integer> - Maximum Snapshot Copies for Schedule

This specifies the maximum number of Snapshot copies that can be taken by the specified schedule. The total count of all the Snapshot copies to be retained for the policy cannot be more than 1023.

[-prefix <text>] - Snapshot Copy Name Prefix for Schedule

This option specifies the prefix with which Snapshot copies will be created for the added schedule. Every schedule has only one prefix. Once a prefix gets associated with a schedule, you cannot update the prefix. If some prefix is already associated with the schedule and you do not specify this parameter, then the previously defined prefix is used. The command fails if you try to update an existing prefix for a schedule. If no prefix is associated with the schedule and you do not specify this parameter, then schedule name is be used as the prefix.

[-snapmirror-label <text>] - Label for SnapMirror Operations

This specifies the SnapMirror Label identified with a Snapshot copy when it is created for the added schedule. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

Examples

The following example adds a schedule named midnight to the Snapshot policy named snappolicy_nightly on Vserver vs0. The schedule can take a maximum of five Snapshot copies.

```
cluster1::> volume snapshot policy add-schedule -vserver vs0 -policy snappolicy_nightly -schedule midnight -count 5
```

volume snapshot policy create

Create a new snapshot policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot policy create` command creates a Snapshot policy. A Snapshot policy includes at least one schedule, up to a maximum of five schedules, and a maximum number of Snapshot copies per schedule. You can create a schedule by using the [“job schedule cron create” on page 180](#) or [“job schedule interval create” on page 183](#) commands. When applied to a volume, the Snapshot policy specifies the schedule on which Snapshot copies are taken and the maximum number of Snapshot copies that each schedule can take. The total count of all the Snapshot copies to be retained for the policy cannot be more than 1023.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the Snapshot policy is to be created.

-policy <snapshot policy> - Snapshot Policy Name

This specifies the Snapshot policy that is to be created.

-enabled {true|false} - Snapshot Policy Enabled

This specifies whether the Snapshot policy is enabled.

[-comment <text>] - Comment

This option specifies a text comment for the Snapshot policy.

-schedule1 <text> - Schedule1 Name

This specifies the name of the first schedule associated with the Snapshot policy.

-count1 <integer> - Maximum Snapshot Copies for Schedule1

This specifies the maximum number of Snapshot copies that can be taken by the first schedule.

[-prefix1 <text>] - Snapshot Copy Name Prefix for Schedule1

This option specifies the prefix associated with the first schedule. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

[-snapmirror-label1 <text>] - Label for SnapMirror Operations for Schedule1

This specifies the SnapMirror Label of the first schedule associated with the Snapshot policy. Once specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

[-schedule2 <text>] - Schedule2 Name

This option specifies the name of the second schedule associated with the Snapshot policy. If this parameter is specified, the -count2 parameter must also be specified.

[-count2 <integer>] - Maximum Snapshot Copies for Schedule2

This option specifies the maximum number of Snapshot copies that can be taken by the second schedule. If this parameter is specified, the -schedule2 parameter must also be specified.

[-prefix2 <text>] - Snapshot Copy Name Prefix for Schedule2

This option specifies the prefix associated with the second schedule. If this parameter is specified, -schedule2 and -count2 parameters must also be specified. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

[-snapmirror-label2 <text>] - Label for SnapMirror Operations for Schedule2

This specifies the SnapMirror Label of the second schedule associated with the Snapshot policy. Once specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

[-schedule3 <text>] - Schedule3 Name

This option specifies the name of the third schedule associated with the Snapshot policy. If this parameter is specified, the -count3 parameter must also be specified.

[-count3 <integer>] - Maximum Snapshot Copies for Schedule3

This option specifies the maximum number of Snapshot copies that can be taken by the third schedule. If this parameter is specified, the -schedule3 parameter must also be specified.

[-prefix3 <text>] - Snapshot Copy Name Prefix for Schedule3

This option specifies the prefix associated with the third schedule. If this parameter is specified, `-schedule3` and `-count3` parameters must also be specified. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

[-snapmirror-label3 <text>] - Label for SnapMirror Operations for Schedule3

This specifies the SnapMirror Label of the third schedule associated with the Snapshot policy. Once specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

[-schedule4 <text>] - Schedule4 Name

This option specifies the name of the fourth schedule associated with the Snapshot policy. If this parameter is specified, the `-count4` parameter must also be specified.

[-count4 <integer>] - Maximum Snapshot Copies for Schedule4

This option specifies the maximum number of Snapshot copies that can be taken by the fourth schedule. If this parameter is specified, the `-schedule4` parameter must also be specified.

[-prefix4 <text>] - Snapshot Copy Name Prefix for Schedule4

This option specifies the prefix associated with the fourth schedule. If this parameter is specified, `-schedule4` and `-count4` parameters must also be specified. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

[-snapmirror-label4 <text>] - Label for SnapMirror Operations for Schedule4

This specifies the SnapMirror Label of the fourth schedule associated with the Snapshot policy. Once specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

[-schedule5 <text>] - Schedule5 Name

This option specifies the name of the fifth schedule associated with the Snapshot policy. If this parameter is specified, the `-count5` parameter must also be specified.

[-count5 <integer>] - Maximum Snapshot Copies for Schedule5

This option specifies the maximum number of Snapshot copies that can be taken by the fifth schedule. If this parameter is specified, the `-schedule5` parameter must also be specified.

[-prefix5 <text>] - Snapshot Copy Name Prefix for Schedule5

This option specifies the prefix associated with the fifth schedule. If this parameter is specified, `-schedule5` and `-count5` parameters must also be specified. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

[-snapmirror-label5 <text>] - Label for SnapMirror Operations for Schedule5

This specifies the SnapMirror Label of the fifth schedule associated with the Snapshot policy. Once specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

Examples

The following example creates a Snapshot policy named `snappolicy_4hrs` on a Vserver named `vs0`. The policy runs on a single schedule named `4hrs` with a prefix `every_4_hour` and has a maximum number of five Snapshot copies.

```
cluster1::> volume snapshot policy create -vserver vs0 -policy snappolicy_4hrs
-schedule1 4hrs -count1 5 -prefix1 every_4_hour
```

volume snapshot policy delete

Delete a snapshot policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot policy delete` command deletes a Snapshot policy.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the Snapshot policy is to be deleted.

-policy <snapshot policy> - Snapshot Policy Name

This specifies the Snapshot policy that is to be deleted.

Examples

The following example deletes a Snapshot policy named `snappolicy_hourly` on Vserver `vs0`:

```
cluster1::> volume snapshot policy delete -vserver vs0 -policy snappolicy_hourly
```

volume snapshot policy modify

Modify a snapshot policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot policy modify` command enables you to modify the description associated with a Snapshot policy and whether the policy is enabled or disabled.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the Snapshot policy is to be modified.

-policy <snapshot policy> - Snapshot Policy Name

This specifies the Snapshot policy that is to be modified.

[-enabled {true|false}] - Snapshot Policy Enabled

This optionally specifies whether the Snapshot policy is enabled.

[-comment <text>] - Comment

This specifies the comment text for the Snapshot policy.

[-snapmirror-labels <text>, ...] - Label for SnapMirror Operations

This optionally specifies a comma separated list of SnapMirror labels that are applied to the schedules in the Snapshot policy. Each label in the list applies to only one schedule in the Snapshot policy (maximum of 5 SnapMirror labels), the first label applying to the first schedule, the second label applying to the second schedule, and so on. You can have a maximum of five SnapMirror labels, which corresponds to the maximum number of schedules a Snapshot policy can have. If an empty string ("") is specified, the existing labels will be deleted from all the schedules.

Examples

The following example changes the description of a Snapshot policy named `snappolicy_wknd` on Vserver `vs0` to "Runs only on weekends":

```
cluster1::> volume snapshot policy modify -vserver vs0 -policy snappolicy_wknd -comment "Runs only on weekends"
```

volume snapshot policy modify-schedule

Modify a schedule within snapshot policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot policy modify-schedule` command modifies the maximum number of Snapshot copies that can be taken by a Snapshot policy's schedule.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which a Snapshot policy schedule is to be modified.

-policy <snapshot policy> - Snapshot Policy Name

This specifies the Snapshot policy whose schedule is to be modified.

-schedule <text> - Schedule Name

This specifies the schedule that is to be modified.

[-newcount <integer>] - Maximum Snapshot Copies for Schedule

This specifies the maximum number of Snapshot copies that can be taken by the specified schedule.

The total count of all the Snapshot copies to be retained for the policy cannot be more than 1023.

[-newsnapmirror-label <text>] - Label for SnapMirror Operations

This specifies the SnapMirror Label identified with a Snapshot copy when it is created for the specified schedule. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination. If an empty label ("") is specified, the existing label will be deleted.

Examples

The following example changes the maximum number of Snapshot copies from five to four for a schedule named `midnight` on a Snapshot policy named `snappolicy_nightly` on Vserver `vs0`:

```
cluster1::> volume snapshot policy modify-schedule -vserver vs0 -policy snappolicy_nightly -schedule midnight -newcount 4
```

volume snapshot policy remove-schedule

Remove a schedule from snapshot policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot policy remove-schedule` command removes a schedule from a Snapshot policy.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which a Snapshot policy schedule is to be removed.

-policy <snapshot policy> - Snapshot Policy Name

This specifies the Snapshot policy from which a schedule is to be removed.

-schedule <text> - Schedule Name

This specifies the schedule that is to be removed from the Snapshot policy.

Examples

The following example removes a schedule named `hourly` from a Snapshot policy named `snappolicy_daily` on Vserver `vs0`:

```
cluster1::> volume snapshot policy remove-schedule -vserver vs0 -policy snappolicy_daily -schedule hourly
```

volume snapshot policy show

Show snapshot policies

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume snapshot policy show` command displays the following information about Snapshot policies:

- Vserver name
- Snapshot policy name
- Number of schedules in the policy
- Comment for the policy
- Individual schedule names
- Maximum number of Snapshot copies associated with each schedule
- Snapshot copy name prefixes for the schedules
- SnapMirror Labels associated with the schedules

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| **[-revert-incompatible] (privilege: advanced)**

If this parameter is specified, the command displays Snapshot policies that are not supported in Data ONTAP 8.2. The total Snapshot copy count in the policy needs to be reduced to be equal to or less than the supported count for the revert operation to succeed.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

If this parameter is specified, the command displays Snapshot policies on the specified Vserver.

[-policy <snapshot policy>] - Snapshot Policy Name

If this parameter is specified, the command displays detailed information about the specified Snapshot policy.

[-enabled {true|false}] - Snapshot Policy Enabled

If this parameter is specified, the command displays detailed information only about the Snapshot policy or policies that have the specified enabled value.

[-comment <text>] - Comment

If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified comment.

[-total-schedules <integer>] - Total Number of Schedules in This Policy

If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified total number of schedules.

[-schedules <text>, ...] - Schedule Name

If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified list of schedules.

[-counts <integer>, ...] - Maximum Snapshots for the Schedule

If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified list of maximum numbers of Snapshot copies per schedule.

[-prefixes <text>, ...] - Prefix Name

If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified list of prefixes.

[-snapmirror-labels <text>, ...] - Label for SnapMirror Operations

If this parameter is specified, the command displays information only about the Snapshot policies that have the specified SnapMirror Label. When you specify a list of SnapMirror labels, the command displays all the Snapshot policies that contain any of the SnapMirror Labels specified in the list.

[-policy-owner <text>] - Owner of the policy

If this parameter is specified, the command displays information only about the Snapshot policies that have the specified policy owner.

[-total-count <integer>] - Total Number of Snapshots in This Policy

If this parameter is specified, the command displays information only about the Snapshot policies that have the specified total number of Snapshot copies.

Examples

The following example displays information about all Snapshot policies:

```
cluster1::> volume snapshot policy show
Vserver: cm
```

Policy Name	Number of Is		Schedules Enabled		Comment
default	3	false			Default policy with hourly, daily & weekly schedules.
Schedule	Count	Prefix	SnapMirror Label		
hourly	6	hourly	-		
daily	2	daily	-		
weekly	2	weekly	-		
default-1weekly	3	false			Default policy with 6 hourly, 2 daily & 1 weekly schedule.
Schedule	Count	Prefix	SnapMirror Label		
hourly	6	hourly	-		
daily	2	daily	-		
weekly	1	weekly	-		
none	0	false			Policy for no automatic snapshots.
Schedule	Count	Prefix	SnapMirror Label		
-	-	-	-		

```
Vserver: vs0
```

Policy Name	Number of Is		Schedules Enabled		Comment
p1	1	false			-
Schedule	Count	Prefix	SnapMirror Label		
weekly	2	weekly	-		
p2	2	true			-
Schedule	Count	Prefix	SnapMirror Label		
hourly	6	hourly	-		
daily	2	daily	-		

5 entries were displayed.

volume transition-convert-dir commands

Manage conversion of a 7-mode directory into a Cluster-mode

volume transition-convert-dir show

Display 7-Mode directories being converted

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `volume transition-convert-dir show` command displays information about ongoing directory copy conversion operations.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

Displays summary information about the ongoing copy conversions of directories for the volumes in the specified Vserver.

[-volume <volume name>] - Volume Name

Displays summary information about the ongoing copy conversions of directories that are occurring on the specified volume.

[-path <text>] - Directory Being Converted

Displays summary information for the ongoing copy conversions of directories that have the specified directory path to convert.

[-job-id <integer>] - Convert Job ID

Displays summary information for the ongoing copy conversions of directories that have the specified job ID.

[-state {Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - Operation State

Displays summary information for the copy conversions of directories that have the specified job state.

[-bytes-total <integer>] - Bytes Total

Displays summary information for copy conversions which have the estimated number of bytes of directory content to convert.

[-bytes-completed <integer>] - Bytes Completed

Displays summary information for copy conversions which have the estimated number of bytes of directory content that have completed conversion. The value of this field will be updated approximately once per minute.

Examples

The following example illustrates how to show directory conversions for a volume:

```
cluster1::*> volume transition-convert-dir show -volume vol1
Vserver   Volume   Convert Job ID   Directory-path   State
-----
vs0       vol1           151 /data/large_dir   Running
```

volume transition-convert-dir start

Start converting a 7-Mode directory to Cluster-mode

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `volume transition-convert-dir start` command moves the directory entries in an existing directory to a new temporary directory and then replaces the existing directory with the temporary directory. This command only has a use for directories that were created in a non-Unicode format on a 7-Mode storage system and then transitioned to clustered Data ONTAP by using a SnapMirror relationship of type TDP. This command converts the directories to the Unicode format in a way that is less likely to disrupt the operation of the Data ONTAP systems than the existing directory conversion mechanisms. The temporary directory is visible from clients. Attempting to manipulate the directory being copied or the temporary directory might result in expected side-effects and should be avoided.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

Specifies the volume in which the directory to be converted is located.

-path <file path> - Directory Path

Specifies the path to the directory to be converted from the root of the volume specified with the `-volume` parameter. The root directory of a volume might not be converted using this command. Also, the path must not have a symbolic link as the last component in the path.

Examples

The following example shows how to start a 7-mode directory conversion for a given path in a volume:

```
cluster1::*> volume transition-convert-dir start -vserver vs0 -volume vol1 -path /data/large_dir
```

Chapter 29. Vserver Commands

Manage Vservers

The `vserver` commands enable you to manage Vservers and their attributes, including the configuration of the CIFS and NFS protocols, export policies, name mappings between CIFS and NFS users, and network services.

vserver add-aggregates

Add aggregates to the Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `vserver add-aggregates` command adds aggregates to the Vserver.

Parameters

-vserver <vserver> - Vserver

Specifies the Vserver for which aggregates have to be added.

-aggregates <aggregate name>, ... - List of Aggregates to Be Added

Specifies the list of aggregates to add to the Vserver. The root aggregates should not be specified in this list because though the command will return success, volumes cannot be created on root aggregates. In a MetroCluster configuration, this command does not honor the remote cluster's aggregates.

Examples

The following example illustrates how to add aggregates *aggr1* and *aggr2* to a Vserver named *vs.example.com*:

```
cluster1::> vserver add-aggregates -vserver vs.example.com -aggregates aggr1,aggr2
```

vserver add-protocols

Add protocols to the Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `vserver add-protocols` command adds given protocols to a specified Vserver.

Parameters

-vserver <vserver> - Vserver

This specifies the Vserver that is to be modified.

-protocols {nfs|cifs|fc|iscsi|ndmp|nvme}, ... - Protocols

This parameter specifies the list of protocols to be allowed to run on the Vserver. Possible values include *nfs*, *cifs*, *fc*, *iscsi*, *ndmp* and *nvme*.

Examples

The following example shows adding protocol 'cifs' to a vserver named *vs0.example.com*.

```
cluster1::> vserver add-protocols -vserver vs0.example.com -protocols cifs
```

vserver context

Set Vserver context

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Cluster administrators can use the `vserver context` command to login to a specified Vserver with a specified Vserver user name. All subsequent commands will be issued in the context of that Vserver. The role of the cluster administrator will be the same as that of the user name with which the Vserver context was set. The context is valid for the duration of the CLI or Web UI session in which it is specified. The [Chapter 1 “exit” on page 1](#) command can be used to return to the original context.

Parameters

-vserver <vserver> - Vserver

Use this parameter to specify the Vserver.

[-username <text>] - Vserver Administrator User Name

Use this parameter to specify a Vserver administrator user name for the context. The default value *vsadmin* is used if one is not specified.

Examples

The following example sets the CLI context to Vserver *vs0.example.com*. All subsequently issued commands will be executed in the context of that Vserver:

```
cluster1::> vserver context -vserver vs0.example.com
Info: Use 'exit' command to return.
vs0.example.com::>
```

vserver create

Create a Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `vserver create` command creates a Vserver.

Parameters

-vserver <vserver> - Vserver

This specifies the name of the Vserver that is to be created. Use a fully qualified domain name (FQDN) - for example, "data.example.com" - for the Vserver to ensure unique Vserver names across cluster leagues.

Note: Maximum number of characters supported is 47, and 41 for a Vserver with subtype "sync-source". "all" is a reserved name and must not be used as a Vserver name.

[-subtype <vserver subtype>] - Vserver Subtype

This specifies the subtype of the Vserver being created. Possible values are:

- default - For default data Vservers
- dp-destination - For Data Protection destination Vservers
- sync-source - For MetroCluster source Vservers
- sync-destination - For MetroCluster destination Vservers

[-rootvolume <volume name>] - Root Volume

This parameter optionally specifies the name of the Vserver's root volume, which is created when the Vserver is created. The default name is *svm_root*. The size of the Vserver's root volume is 1GB

[-aggregate <aggregate name>] - Aggregate

This parameter optionally specifies the storage aggregate that holds the Vserver's root volume. Selection of the aggregate is based on the Vserver setup algorithm.

- Creating a root volume on the SnapLock aggregate is not supported.
- Creating a root volume of sync-source Vserver on the unmirrored aggregate is not supported.

[-rootvolume-security-style <security style>] - Root Volume Security Style

This parameter optionally specifies the security style for the Vserver's root volume. Possible values include *unix* (for UNIX mode bits), *ntfs* (for CIFS ACLs), and *mixed* (for mixed NFS and CIFS access). The default value is *unix*. Regardless of the security style, both NFS and CIFS clients can read from and write to the root volume.

[-language <Language code>] - Default Volume Language Code

This optionally specifies the default language encoding setting for the Vserver and its volumes. The recommended format is to append *.UTF-8* for the language encoding values. For example, for the *en_US* language, the recommended format is *en_US.UTF-8*. The default setting is *C.UTF-8*.

[-snapshot-policy <snapshot policy>] - Snapshot Policy

This optionally specifies the Snapshot policy for new volumes created on the Vserver. If no value is specified, the default Snapshot policy is used. You can use the *-snapshot-policy* parameter on the [“volume create” on page 1310](#) or [“volume modify” on page 1321](#) commands to set the Snapshot policy on a specific volume, regardless of its Vserver's Snapshot policy setting.

[-comment <text>] - Comment

This optionally specifies a comment for the Vserver.

[-quota-policy <text>] - Quota Policy

This optionally specifies a quota policy for the Vserver.

[-caching-policy <text>] - Caching Policy Name

This optionally specifies the caching policy to apply to the Vserver. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- *none* - Does not cache any user data or metadata blocks.
- *auto* - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- *meta* - Read caches only metadata blocks.
- *random_read* - Read caches all metadata and randomly read user data blocks.
- *random_read_write* - Read caches all metadata, randomly read and randomly written user data blocks.
- *all_read* - Read caches all metadata, randomly read, and sequentially read user data blocks.
- *all_read_random_write* - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- *all* - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is *auto*.

[-ipspace <IPspace>] - IPspace Name

This optionally specifies the IPspace the Vserver will be assigned to. If left unspecified, the Vserver will be assigned to the default IPspace.

[-foreground {true|false}] - Foreground Process

This parameter optionally specifies whether the Vserver create operation can be executed in the background. If nothing is specified, by default the Vserver create operation is executed in the foreground.

Examples

The following example creates a Vserver named *vs0.example.com* in the IPspace *ipspace123*. The Vserver's root volume is named *root_vs0* and is located on aggregate *aggr0*. The Vserver uses NIS for network information, a file for name mapping information, and the language is U.S. English:

```
cluster1::> vserver create -vserver vs0.example.com -ipspace ipspace123 -rootvolume root_vs0 -aggregate aggr0
-language en_US.UTF-8 -rootvolume-security-style mixed
```

The following example creates a Vserver named *vs1* using default values. The default name for the Vserver's root volume is *svm_root* and the Vserver is located on an aggregate selected on the basis of the Vserver setup algorithm. The default root volume's security style is set to *unix*.

```
cluster1::> vserver create -vserver vs1
cluster1::> vserver show -vserver vs1 -fields rootvolume, rootvolume-security-style, aggregate
vserver rootvolume aggregate rootvolume-security-style
-----
vs1      svm_root    aggr1      unix
```

vserver delete

Delete an existing Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `vserver delete` command deletes a specified Vserver. If the Vserver is associated with one or more volumes, you must manually delete volumes (including root and mirror volumes) before you delete the Vserver. If the Vserver subtype is *dp-destination*, change the Vserver subtype to *default* by specifying the Vserver as the destination in the [“snapmirror break” on page 584](#) command before deleting the objects owned by the Vserver.

Parameters

-vserver <vserver> - Vserver

This specifies the Vserver that is to be deleted.

[-foreground {true|false}] - Foreground Process

This optionally specifies the Vserver delete operation can be executed in the background. If nothing is specified, by default the Vserver delete operation is executed in the foreground.

Examples

The following example deletes a Vserver named *vs2.example.com*:

```
cluster1::> vserver delete -vserver vs2.example.com
```

vserver modify

Modify a Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `vserver modify` command modifies the attributes of a specified Vserver. If the Vserver subtype is of type *dp-destination*, then only the `-aggr-list` parameter can be modified.

Parameters

-vserver <vserver> - Vserver

This specifies the Vserver that is to be modified.

[-language <Language code>] - Default Volume Language Code

This optional parameter specifies the default language encoding setting for the Vserver and its volumes. The recommended format is to append *.UTF-8* for the language encoding values. For example, for the *en_US* language, the recommended format is *en_US.UTF-8*. The default setting is *C.UTF-8*. This field is not modifiable on a Vserver with Infinite Volume.

[-snapshot-policy <snapshot policy>] - Snapshot Policy

This optional parameter specifies the Snapshot policy for a Vserver being modified.

[-comment <text>] - Comment

This optional parameter specifies a comment for the Vserver.

[-quota-policy <text>] - Quota Policy

This optional parameter specifies a quota policy to be used for all volumes associated with a Vserver. You can create and configure multiple, different quota policies, but each Vserver must have one and only one associated quota policy. This parameter is not supported on a Vserver with Infinite Volume.

[-aggr-list <aggregate name>, ...] - List of Aggregates Assigned

This optional parameter specifies a confined list of aggregates on which volumes can be created for a Vserver by the Vserver administrator. But these aggregates do not become exclusive property of the Vserver, i.e. they might be assigned for use to other Vservers. If the value of this parameter is specified as "-", then the Vserver administrator cannot create any volumes for that Vserver. Note that the cluster administrator will still be able to create volumes on any aggregate and assign them to this Vserver.

[-max-volumes <unsigned32_or_unlimited>] - Limit on Maximum Number of Volumes allowed

This optional parameter specifies the maximum number of volumes that can be created for the Vserver, including the root volume. This value is not modifiable on a Vserver with Infinite Volume.

[-admin-state {running|stopped|starting|stopping}] - Vserver Admin State (privilege: advanced)

Use this parameter to set the admin state of the Vserver if the Vserver start or stop job fails. Possible values include *running* and *stopped*.

[-allowed-protocols {nfs|cifs|fc|iscsi|ndmp|nvme}, ...] - Allowed Protocols

This optional parameter specifies the list of protocols to be allowed to run on the Vserver. When part of *vserver-modify*, this field should include the existing list along with the new protocol list to be added to prevent data disruptions. Possible values include *nfs*, *cifs*, *fc*, *iscsi*, *ndmp* and *nvme*. Possible values for a Vserver with Infinite Volume include *nfs* and *cifs*.

[-disallowed-protocols {nfs|cifs|fc|iscsi|ndmp|nvme}, ...] - Disallowed Protocols

This optional parameter specifies the list of protocols to be disallowed to run on the Vserver. When part of *vserver-modify*, this field should include the existing list along with the new protocol list to be added to prevent data disruptions. Possible values include *nfs*, *cifs*, *fc*, *iscsi*, *ndmp* and *nvme*. Only the protocols configured for Vservers with Infinite Volume can be disallowed.

[-qos-policy-group <text>] - QoS Policy Group

This optionally specifies which QoS policy group to apply to the Vserver. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a Vserver, the system will not monitor and control the traffic to it. To remove this Vserver from a policy group, enter the reserved keyword "none". This parameter is not supported on a Vserver with Infinite Volume.

[-caching-policy <text>] - Caching Policy Name

This optionally specifies the caching policy to apply to the Vserver. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

[-foreground {true|false}] - Foreground Process

This optionally specifies whether the Vserver modify operation can be executed in the background. If nothing is specified, by default the Vserver modify operation is executed in the foreground.

Examples

The following example modifies the quota policy for a Vserver named vs0.example.com to pol1, specifies a Snapshot policy named daily, adds the comment "Sales team access".

```
cluster1::> vsserver modify -vserver vs0.example.com -snapshot-policy daily
               -comment "Sales team access" -quota-policy pol1
```

vserver prepare-for-revert

Prepares Vservers to be reverted

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `vserver prepare-for-revert` command prepares Vservers to be reverted to the previous version of Data ONTAP. It disables any operations that cannot be scheduled during revert.

Examples

The following example prepares all Vservers to be reverted.

```
cluster1::*> vserver prepare-for-revert
```

vserver remove-aggregates

Remove aggregates from the Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `vserver remove-aggregates` command removes aggregates from the Vserver.

Parameters

-vserver <vserver> - Vserver

Specifies the Vserver from which aggregates have to be removed.

-aggregates <aggregate name>, ... - List of Aggregates to Be Removed

Specifies the list of aggregates to remove from the Vserver.

Examples

The following example illustrates how to remove aggregates *aggr1* and *aggr2* from a Vserver named *vs.example.com*:

```
cluster1::> vserver remove-aggregates -vserver vs.example.com -aggregates aggr1,aggr2
```

vserver remove-protocols

Remove protocols from the Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `vserver remove-protocols` command removes the specified protocols from the specified Vserver. When you remove the protocols from a Vserver, the data access with respect to the removed protocols is disrupted.

Parameters

-vserver <vserver> - Vserver

Specifies the Vserver that is to be modified.

-protocols {nfs|cifs|fc|iscsi|ndmp|nvme}, ... - Protocols

This parameter specifies the list of protocols to be removed. on the Vserver. Possible values include *nfs*, *cifs*, *fc*, *iscsi*, *ndmp* and *nvme*.

Examples

The following example shows removing protocol 'cifs' from a Vserver named *vs0.example.com*.

```
cluster1::> vserver remove-protocols -vserver vs0.example.com -protocols cifs
```

vserver rename

Rename a Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `vserver rename` command renames the Vserver. If the vserver being renamed is participating in an Inter-cluster Vserver peer relationship, all the corresponding remote clusters will be updated with the new peer Vserver name.

Parameters

-vserver <text> - Vserver

This specifies the Vserver that is to be renamed.

-newname <vserver> - New Vserver name (Use Fully Qualified Domain Name, For example: data.example.com)

This specifies the Vserver's new name. The name must be a unique Vserver name in the cluster. Use a fully qualified domain name (FQDN) - for example, "data.example.com" - for the Vserver name to reduce name collisions in cluster leagues.

Note: Maximum number of characters supported is 47, and 41 for a Vserver with subtype "sync-source". "all" is a reserved name and must not be used as a Vserver name.

[-foreground {true|false}] - Foreground Process

This specifies whether the rename job will be run in foreground or background. By default, the job runs in foreground.

Examples

The following examples rename a Vserver named *vs1.example.com* as *vs2.example.com*, and then finally back to its original name:

```
(When there is no intercluster Vserver peer relationship with the vserver)

cluster1::> vserver rename -vserver vs1.example.com -newname vs2.example.com

(When there is at least one intercluster peer relationship with the Vserver)

cluster1::> vserver rename -vserver vs1.example.com -newname vs2.example.com

[Job 277] Job succeeded: Vserver rename completed successfully

cluster1::> vserver rename -vserver vs2.example.com -newname vs1.example.com -foreground false

[Job 278] Job is queued: Rename Vserver vs2.example.com to vs1.example.com.
```

vserver restamp-msid

Restamp the MSIDs of all the volumes in a Vserver to match or be different from the source Vserver

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `vserver restamp-msid` command restamps MSIDs of all volumes in a dp-destination Vserver to make them either identical to the VserverDR source Vserver. The command is run on secondary VserverDR site and automatically updates the MSID preserve behavior for the Vserver. A [“snapmirror resync” on page 622](#) must be run after this command completes.

Parameters

-vserver <vserver name> - Vserver name

The name of the dp-destination Vserver.

-preserve-msid {true|false} - Make MSID same as that of source Vserver. False sets the values as different.

Boolean value through which the user can specify whether to make the MSIDs of the volumes same as that of Source Vserver. Specifying true will make the MSIDs same and specifying false will make them different.

Examples

This example will stamp all the volumes of Vserver *vs1dp* with the same MSID as the source Vserver.

```
cluster1::>vserver restamp-msid -vserver vs1dp -preserve-msid true
```

vserver show

Display Vservers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver show` command displays the following information:

- Vserver name
- Vserver type (*data*, *admin*, *node* or *system* - detailed view only)

- Vserver subtype (*default*, *dp-destination*, *sync-source*, and *sync-destination* - detailed view only)
- Vserver universal unique identifier (detailed view only)
- Root volume name
- Aggregate on which the root volume is located
- Associated NIS domain
- Root volume security style (*unix* for UNIX mode bits, *ntfs* for CIFS ACLs, *mixed* for both (detailed view only), or *unified* (Infinite Volumes only))
- LDAP client
- Language (detailed view only)
- Snapshot policy (detailed view only)
- Comment text (detailed view only)
- Quota policy (detailed view only)
- Aggregate list (detailed view only)
- Maximum Volumes (detailed view only)
- Qos-policy-group (detailed view only)
- Config-lock (detailed view only)
- Admin state (*running*, *stopped*, *starting*, *stopping*, *initializing*, or *deleting*)
- Operational state (*running*, or *stopped*)
- Operational state stopped reason (*sync-destination-and-switchover-not-done*, or *cluster-reboot-done*, or *admin-state-stopped*)
- Allowed Protocols (*nfs*, *cifs*, *fcp*, *iscsi*, *nvme*, *ndmp* - detailed view only)
- Disallowed Protocols (*nfs*, *cifs*, *fcp*, *iscsi*, *nvme*, *ndmp* - detailed view only)
- Whether the Vserver is a Vserver with Infinite Volume (detailed view only)
- IPspace to which the Vserver belongs (detailed view only)
- Caching policy

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-protocols]

If this optional parameter is specified, the command displays the allowed and disallowed set of protocols for the Vserver(s).

| [-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver

If this parameter is specified, the command displays detailed information about the specified Vserver.

[-type <vserver type>] - Vserver Type

If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified Vserver type. Types include *admin* for the cluster-wide management Vserver, *system* for cluster-level communications in an IPspace, *data* for data serving Vserver, and *node* for node management Vserver.

[-subtype <vserver subtype>] - Vserver Subtype

If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified Vserver subtype. Types include:

- *default* for default data Vserver
- *dp-destination* for Data Protection destination Vserver.
- *sync-source* for MetroCluster source Vserver,
- *sync-destination* for MetroCluster destination Vserver.

[-uuid <UUID>] - Vserver UUID

If this parameter is specified, the command displays information only about the Vserver that match the specified UUID.

[-rootvolume <volume name>] - Root Volume

If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified root volume.

[-aggregate <aggregate name>] - Aggregate

If this parameter is specified, the command displays information only about the Vserver or Vservers that have their root volumes contained by the specified aggregate.

[-nisdomain <nis domain>] - NIS Domain

If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified NIS domain.

[-rootvolume-security-style <security style>] - Root Volume Security Style

If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified root-volume security style. The *unified* security style, which applies only to Infinite Volumes, cannot be applied to a Vserver's root volume.

[-ldap-client <text>] - LDAP Client

If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified LDAP client.

[-language <Language code>] - Default Volume Language Code

If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified language. To determine the available languages, enter "`vserver show -language ?`" at the clustershell command prompt and at the Vserver prompt.

[-snapshot-policy <snapshot policy>] - Snapshot Policy

If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified Snapshot policy.

[-comment <text>] - Comment

If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified comment.

[-quota-policy <text>] - Quota Policy

If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified quota policy.

[-aggr-list <aggregate name>, ...] - List of Aggregates Assigned

If this parameter is specified, the command displays information only about the Vserver or Vservers to which the specified aggregate(s) are assigned for use.

[-max-volumes <unsigned32_or_unlimited>] - Limit on Maximum Number of Volumes allowed

If this parameter is specified, the command displays information only about the Vserver or Vservers on which the specified maximum volume count is configured.

[-admin-state {running|stopped|starting|stopping}] - Vserver Admin State

If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified admin-state.

[-operational-state {running|stopped}] - Vserver Operational State

If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified operational-state. This field determines the state of the Vserver LIFs. New LIFs created on a Vserver, which is in running state, will be operationally up and the LIFs created on a Vserver, which is in stopped state, will be operationally down.

[-operational-state-stopped-reason {sync destination and switchover is not done|cluster reboot is done|admin state stopped| dp destination not started}] - Vserver Operational State Stopped Reason

If this parameter is specified, the command displays information only about the Vserver or Vservers that are operationally stopped due to the specified reason. This field indicates the reason for the operational-state of the Vserver being stopped

[-allowed-protocols {nfs|cifs|fcpl|iscsi|ndmp|nvme}, ...] - Allowed Protocols

If this parameter is specified, the command displays information only about the Vserver or Vservers on which the specified protocols are allowed to run.

[-disallowed-protocols {nfs|cifs|fcpl|iscsi|ndmp|nvme}, ...] - Disallowed Protocols

If this parameter is specified, the command displays information only about the Vserver or Vservers on which the specified protocols are disallowed to run.

[-is-repository {true|false}] - Is Vserver with Infinite Volume

If this parameter is specified, the command displays information only about the Vservers which have the specified is-repository value. This will be true for Vservers with Infinite Volume.

[-qos-policy-group <text>] - QoS Policy Group

Display the Vservers that match the specified qos-policy-group.

A policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a Vserver, the system will not monitor and control the traffic to it.

[-caching-policy <text>] - Caching Policy Name

Display the Vservers that match the specified caching-policy.

A caching policy defines the caching behavior of this Vserver at the Flash Cache level. If a caching policy is not assigned to this Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read, and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

[-config-lock {true|false}] - Config Lock

This parameter specifies if the Vserver is locked or unlocked for modification. If the config-lock is set to true, then modifying the Vserver's configuration is not allowed.

[-ipspace <IPspace>] - IPspace Name

If this parameter is specified, the command displays information only about the Vservers that are assigned to the specified IPspace.

[-foreground {true|false}] - Foreground Process

This optionally specifies whether the Vserver show operation can be executed in the background. If nothing is specified, by default the Vserver show operation is executed in the foreground.

Examples

The following example displays information about all Vservers.

```
cluster1::> vserver show
```

```
non mcc setup:
  AdminOperational  Root
Vserver  Type      Subtype    statestate    VolumeAggregate
-----
cluster  admin    -    --    --
node1    node     -    --    --
vs0      data     default   runningrunning  root_vs1aggr0
vs1      data     dp-destination  stoppedstopped  --
```

4 entries were displayed.

```
mcc setup:
```

```
cluster1::> vserver show
  Admin  Operational Root
Vserver  Type      Subtype    state  state    Volume  Aggregate
-----
cluster  admin    ---    -  -
node1    node     ---    -  -
vs2      data     sync-sourcerunningrunning  rv      data_aggr
vs3-mc   data     sync-destinationrunningstopped-  -
```

4 entries were displayed.

vserver show-aggregates

Show details of aggregates in a Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver show-aggregates` command displays the details of all the aggregates that are associated with Vservers. The aggregate details displayed are the aggregate name, state, available size, the type of aggregate and the SnapLock type.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver

If this optional parameter is specified, the command displays the details of aggregates that are associated with the specified Vserver.

[-aggregate <aggregate name>] - Aggregate

If this optional parameter is specified, the command displays all of the Vservers configured with the specified aggregate.

Examples

The following example displays the aggregates configured for Vserver vs.

```
cluster1::> vserver show-aggregates -vserver vs
```

Vserver	Aggregate	State	Available Size	Type	SnapLock-Type
vs	aggr1	online	795.2MB	hdd	non-snaplock
vs	aggr2	online	795.2MB	hdd	non-snaplock

2 entries were displayed.

vserver show-protocols

Show protocols for Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver show-protocols` command displays the running protocols on a given Vserver.

Parameters

[`-fields <fieldname>, ...`]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-vserver <vserver>`] - Vserver

If this parameter is specified, the command displays the allowed set of protocols for the specified Vserver.

[`-protocol {nfs|cifs|fcpl|iscsi|ndmp|nvme}, ...`] - Protocols

If this optional parameter is specified, the command displays all the Vservers configured with the specified protocols.

Examples

The following example displays the protocols configured for Vserver vs1.

```
cluster1::> vserver show-protocols -vserver vs1
Vserver: vs1
Protocols: nfs, cifs
```

vserver start

Start a Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `vserver start` command starts data access on a Vserver.

Parameters

-vserver <vserver> - Vserver

This specifies the name of the Vserver on which the data access is to be started. This operation is only supported on a data Vserver.

Note: The name must be of 47 characters length or less.

`[-foreground {true|false}] - Foreground Process`

This specifies if the `vserver start` command should be executed in the foreground or background. If you do not enter this parameter, it is set to *true*, and the `vserver start` command is executed in the foreground.

`[-force [true]] - Force Vserver Start`

In case of a MetroCluster configuration or Vserver disaster recovery, by using this parameter you can start the Vserver that is either locked (which prevents any configuration changes) or its partner Vserver is operationally running. If you do not enter this parameter, it is set to false.

Examples

The following example starts data access on Vserver *vs0.example.com* in the background.

```
cluster1::> vserver start -vserver vs0.example.com -foreground false
```

vserver stop

Stop a Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `vserver stop` command stops data access on a Vserver.

Parameters

`-vserver <vserver> - Vserver`

This specifies the name of the Vserver on which the data access is to be stopped. This operation is only supported on a data Vserver.

Note: The name must be of 47 characters length or less.

`[-foreground {true|false}] - Foreground Process`

This specifies if `vserver stop` command should be executed in the foreground or background. If you do not enter this parameter, it is set to *true*, and the `vserver stop` command is executed in the foreground.

Examples

The following example stops data access on Vserver *vs0.example.com* in the background.

```
cluster1::> vserver stop -vserver vs0.example.com -foreground false
```

vserver unlock

Unlock Vserver configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `vserver unlock` command revokes the administrative lock on the Vserver configuration. When a Vserver is unlocked, changes to the configuration are permitted. The unlock operation fails if the Vserver is not locked by the administrator or if it is locked by internal applications. If the Vserver fails to unlock due to an error condition, you can use the `-force` option.

Parameters

`-vserver <vserver> - Vserver`

The name of the Vserver that has to be unlocked.

`[-force [true]] - Force Unlock`

This option is specified to unlock the Vserver when the Vserver fails to unlock due to an error condition.

Examples

The following example illustrates how to unlock the Vserver named *vs123.example.com*, *forcefully*:

```
cluster1::> vsserver unlock -vsserver vs1.example.com -force true
```

vserver active-directory commands

Manage Active Directory

vserver active-directory create

Create an Active Directory account. If joining a domain, this command may take several minutes to complete.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver active-directory create` command creates an Active Directory account for a Vserver. When you create the Active Directory account, you must add it to an existing Windows Active Directory domain. When you enter this command, you are prompted to provide the credentials of a user account that has sufficient privileges to add computers to the `-ou` container within the `-domain` domain. The user account must have a password that cannot be empty. When joining a domain, this command may take several minutes to complete.

Note: Each Vserver can have only one Active Directory account.

Parameters

-vsserver <vserver> - Vserver

This parameter specifies the name of the Vserver for which you want to create the Active Directory account. The Vserver must already exist.

-account-name <NetBIOS> - Active Directory NetBIOS Name

This parameter specifies the name of the Active Directory account (up to 15 characters).

-domain <TextNoCase> - Fully Qualified Domain Name

This parameter specifies the name of the Active Directory domain.

[-ou <text>] - Organizational Unit

This parameter specifies the organizational unit within the Active Directory domain. By default, this parameter is set to *CN=Computers*. When specifying this parameter, specify only the organizational unit portion of the distinguished name. Data ONTAP appends the value provided for the required `-domain` parameter onto the value provided for `-ou` parameter to produce the Active Directory distinguished name, which is used when creating the Vserver's Active Directory account in the domain.

Examples

The following example creates an Active Directory account *ADSERVER1* for Vserver *vs1* and domain *example.com*.

```
cluster1::> vsserver active-directory create -vsserver vs1 -account-name ADSERVER1 -domain example.com
```

In order to create an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "CN=Computers" container within the "example.com" domain.

Enter the user name: Administrator

Enter the password:

The following example creates an Active Directory account *ADSERVER2* for Vserver *vs2*, domain *example.com* and organizational unit *sample_ou*.

```
cluster1::> vsriver active-directory create -vsriver vs2 -account-name ADSERVER2 -domain example.com -ou OU=sample_ou
```

In order to create an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "OU=sample_ou" container within the "example.com" domain.

Enter the user name: Administrator

Enter the password:

vsvriver active-directory delete

Delete an Active Directory account

Availability: This command is available to *cluster* and *Vsvriver* administrators at the *admin* privilege level.

Description

The `vsvriver active-directory delete` command deletes the Active Directory account for a specified Vsvriver.

Parameters

-vsriver <vsriver> - Vsvriver

This parameter specifies the Vsvriver for the Active Directory account you want to delete.

Examples

The following example deletes the Active Directory account for a Vsvriver named *vs1*:

```
cluster1::> vsriver active-directory delete -vsriver vs1
```

In order to delete an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to remove computers from the "example.com" domain.

Enter the user name: Administrator

Enter the password:

vsvriver active-directory modify

Modify the domain of an Active Directory account. If re-joining the current domain or joining a new one, this command may take several minutes to complete.

Availability: This command is available to *cluster* and *Vsvriver* administrators at the *admin* privilege level.

Description

The `vsvriver active-directory modify` command modifies the domain of an Active Directory account. You can also re-join the current domain or join a new one. When joining a domain, this command may take several minutes to complete.

Parameters

-vsriver <vsriver> - Vsvriver

This parameter specifies the Vsvriver for the Active Directory account whose associated domain you want to modify.

[-domain <TextNoCase>] - Fully Qualified Domain Name

This parameter specifies the fully qualified name of the Active Directory domain to associate with the Active Directory account.

Examples

The following example modifies the Active Directory domain associated with Vserver *vs1*.

```
cluster1::> vsriver active-directory modify -vsriver vs1 -domain example.com
```

In order to create an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "CN=Computers" container within the "example.com" domain.

Enter the user name: administrator

Enter the password:

vsvriver active-directory password-change

Change the domain account password for an Active Directory account

Availability: This command is available to *cluster* and *Vsvriver* administrators at the *admin* privilege level.

Description

The `vsvriver active-directory password-change` command changes the domain account password for the specified Vsvriver's Active Directory account.

Parameters

-vsriver <vsriver> - Vsvriver

This parameter specifies the name of the Vsvriver associated with the Active Directory account whose domain account password you want to change.

Examples

The following example changes the password for the Active Directory account for a Vsvriver named *vs1*.

```
cluster1::> vsriver active-directory password-change -vsriver vs1
```

vsvriver active-directory password-reset

Reset the domain account password for an Active Directory account

Availability: This command is available to *cluster* and *Vsvriver* administrators at the *admin* privilege level.

Description

The `vsvriver active-directory password-reset` command resets the domain account password for the Active Directory account. This may be required if the password stored along with the machine account in the Windows Active Directory domain is changed or reset without the Vsvriver's knowledge. The operation requires the credentials for a user with permission to reset the password in the organizational unit (OU) that contains the machine account.

Parameters

-vsriver <vsriver> - Vsvriver

This parameter specifies the name of the Vsvriver associated with the Active Directory account whose domain account password you want to reset.

Examples

The following example resets the password for the Active Directory account for a Vserver named *vs1*.
cluster1::> vsserver active-directory password-reset -vsserver vs1

Enter your user ID: Administrator
Enter your password:

vserver active-directory show

Display Active Directory accounts

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver active-directory show` command displays information about Active Directory accounts. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all Active Directory accounts:

- Vserver name
- Active Directory account NetBIOS name
- Domain or workgroup name

You can specify the `-fields` parameter to specify which fields of information to display about Active Directory accounts. You can use `-fields ?` to display the valid values for the `-fields` parameter. In addition to the fields above, you can display the following fields:

- Fully-qualified domain name
- Organizational unit

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Active Directory accounts that are in the Windows Active Directory domain named *RUBY*, run the command with the value of the `-domain-workgroup` parameter set to *RUBY*.

You can specify the `-instance` parameter to display all information for all Active Directory accounts in list form.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

[-vsserver <vserver>] - Vserver

If you specify this parameter, the command displays information only about the Active Directory account for the specified Vserver.

[-account-name <NetBIOS>] - Active Directory NetBIOS Name

If you specify this parameter, the command displays information only for the Active Directory accounts that match the specified NetBIOS account name.

[-domain-workgroup <CIFS domain>] - NetBIOS Domain/Workgroup Name

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified NetBIOS domain or workgroup.

Note: Workgroups are not supported in this release.

[-domain <TextNoCase>] - Fully Qualified Domain Name

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified domain.

[-ou <text>] - Organizational Unit

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified organizational unit.

[-auth-style {domain|workgroup|realm}] - Authentication Style

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified authentication style.

Examples

The following example displays a subset of the information about all Active Directory accounts.

```
cluster1::> vsriver active-directory show
```

Vserver	Account Name	Domain/Workgroup Name
vs1	ADSERVER1	EXAMPLE

The following example displays all information about all Active Directory Vservers in list form.

```
cluster1::> vsriver active-directory show -instance
```

```

Vserver: vs1
Active Directory account NetBIOS Name: ADSERVER1
NetBIOS Domain/Workgroup Name: EXAMPLE
Fully Qualified Domain Name: EXAMPLE.COM
Organizational Unit: CN=Computers
```

Vserver Audit Commands

Manage auditing of protocol requests that the Vserver services

The `vsriver audit` commands enable you to manage auditing of protocol requests that the Vserver services.

vsriver audit create

Create an audit configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vsriver audit create` command creates an audit configuration for a Vserver.

When you create an audit configuration, you can also specify the rotation method. By default, the audit log is rotated based on size.

You can use the time-based rotation parameters in any combination (`-rotate-schedule-month`, `-rotate-schedule-dayofweek`, `-rotate-schedule-day`, `-rotate-schedule-hour`, and `-rotate-schedule-minute`). The `-rotate-schedule-minute` parameter is mandatory. All other time-based rotation parameters are optional.

The rotation schedule is calculated by using all the time-related values. For example, if you specify only the `-rotate-schedule-minute` parameter, the audit log files are rotated based on the minutes specified on all days of the week, during all hours on all months of the year. If you specify only one or two time-based rotation parameters (say `-rotate-schedule-month` and `-rotate-schedule-minutes`), the log files are rotated based on the minute values that you specified on all days of the week, during all hours, but only during the specified months. For example, you can specify that the audit log is to be rotated during the months January, March, and August on all Mondays, Wednesdays, and Saturdays at 10:30.

If you specify values for both `-rotate-schedule-dayofweek` and `-rotate-schedule-day`, they are considered independently. For example if you specify `-rotate-schedule-dayofweek` as Friday and `-rotate-schedule-day` as 13 then the audit logs would be rotated on every Friday and on the 13th day of the specified month, not just on every Friday the 13th.

This command is not supported on a Vserver with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver on which to create the audit configuration. The Vserver must already exist.

-destination <text> - Log Destination Path

This parameter specifies the audit log destination path where consolidated audit logs are stored. If the path is not valid, the command fails. The path can be up to 864 characters in length and must have read-write permissions.

[-events {file-ops|cifs-logon-logoff|cap-staging|file-share|audit-policy-change|user-account|authorization-policy-change|security-group}, ...] - Categories of Events to Audit

This parameter specifies the categories of events to be audited. Supported event categories are: file access events (both CIFS and NFS), CIFS logon and logoff events, Central Access Policy(CAP) staging events, File share events, Audit policy change events, Local User Account Management Events, Local Security Group Management Events and Authorization Policy Change Events. The corresponding parameter values are: *file-ops*, *cifs-logon-logoff*, *cap-staging*, *file-share*, *audit-policy-change*, *user-account*, *security-group* and *authorization-policy-change*. By default, *file-ops*, *cifs-logon-logoff* and *audit-policy-change* events are enabled. The support for *audit-policy-change* event can be modified from diag prompt using [“vserver audit modify” on page 1534](#) command.

[-format {xml|evttx}] - Log Format

This parameter specifies the output format of the audit logs. The output format can be either Data ONTAP-specific XML or Microsoft Windows EVTX log format. By default, the output format is EVTX.

{ [-rotate-size {<integer>[KB|MB|GB|TB|PB]}] - Log File Size Limit

This parameter specifies the audit log file size limit. By default, the audit log is rotated based on size. The default audit log size is 100 MB.

[-rotate-schedule-month <cron_month>, ...] - Log Rotation Schedule: Month

This parameter specifies the monthly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated during the months January, March, and August, or during all the months. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, and all. Specify "all" to rotate the audit logs every month.

[-rotate-schedule-dayofweek <cron_dayofweek>, ...] - Log Rotation Schedule: Day of Week

This parameter specifies the daily (day of the week) schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on Tuesdays and Fridays, or during all the days of a week. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, and all. Specify "all" to rotate the audit logs every day.

[-rotate-schedule-day <cron_dayofmonth>, ...] - Log Rotation Schedule: Day

This parameter specifies the day of the month schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on the 10th and 20th days of a month, or all days of a month. Valid values range from 1 to 31.

[-rotate-schedule-hour <cron_hour>, ...] - Log Rotation Schedule: Hour

This parameter specifies the hourly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at 6 a.m and 10 a.m. Valid values range from 0 (midnight) to 23 (11:00 p.m.). Specify "all" to rotate the audit logs every hour.

-rotate-schedule-minute <cron_minute>, ...} - Log Rotation Schedule: Minute

This parameter specifies the minute schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at the 30th minute. Valid values range from 0 to 59.

[-rotate-limit <integer>] - Log Files Rotation Limit

This parameter specifies the audit log files rotation limit. A value of 0 indicates that all the log files are retained. The default value is 0. For example, if you enter a value of 5, the last five audit logs are retained.

Examples

The following examples create an audit configuration for Vserver vs1 using size-based rotation.

```
cluster1::> vserver audit create -vserver vs1 -destination /audit_log -rotate-size 10MB -rotate-limit 5
```

The following example creates an audit configuration for Vserver vs1 using time-based rotation. The audit logs are rotated monthly, all days of the week, at 12:30.

```
cluster1::> vserver audit create -vserver vs1 -destination /audit_log -rotate-schedule-month all -rotate-schedule-dayofweek all -rotate-schedule-time 12:30
```

The following example creates an audit configuration for Vserver vs1 using time-based rotation. The audit logs are rotated in January, March, May, July, September, and November on Monday, Wednesday, and Friday, at 6:15, 6:30, 6:45, 12:15, 12:30, 12:45, 18:15, 18:30, and 18:45. The last 6 audit logs are retained.

```
cluster1::> vserver audit create -vserver vs1 -destination /audit_log -rotate-schedule-month January,March,May,July,September,November -rotate-schedule-dayofweek Monday,Wednesday,Friday -rotate-schedule-time 6:15,6:30,6:45,12:15,12:30,12:45,18:15,18:30,18:45 -rotate-limit 6
```

The following example creates an audit configuration for Vserver vs1 for auditing CIFS and NFS file access events in the output log format EVTX.

```
cluster1::> vserver audit create -vserver vs1 -destination /audit_log -format evtx -events file-ops
```

vserver audit delete

Delete audit configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver audit delete` command deletes the audit configuration for a Vserver.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver associated with the audit configuration to be deleted.

[-force [true]] - Force Delete (privilege: advanced)

This parameter is used to forcibly delete the audit configuration. By default the setting is false.

Examples

The following example deletes the audit configuration for Vserver vs1.

```
cluster1::> vserver audit delete -vserver vs1
```

vserver audit disable

Disable auditing

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver audit disable` command disables auditing for a Vserver.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for which auditing is to be disabled. The Vserver audit configuration must already exist.

Examples

The following example disables auditing for Vserver vs1.

```
cluster1::> vserver audit disable -vserver vs1
```

vserver audit enable

Enable auditing

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver audit enable` command enables auditing for a Vserver.

Note: Events on FlexGroup volumes are not emitted to the audit log.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for which auditing is to be enabled. The Vserver audit configuration must already exist.

[-force [true]] - Force Enable (privilege: advanced)

This parameter is used to ignore errors while enabling auditing.

Examples

The following example enables auditing for Vserver vs1:

```
cluster1::> vserver audit enable -vserver vs1
```

vserver audit modify

Modify the audit configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver audit modify` command modifies an audit configuration for a Vserver.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for which the audit configuration is to be modified. The Vserver audit configuration must already exist.

If you have configured time-based rotation, modifying one parameter of time-based rotation schedule does not affect the other parameters. For example, if the rotation schedule is set to run at Monday 12:30 a.m., and you modify the `-rotate-schedule-dayofweek` parameter to Monday,Wednesday,Friday, the new rotation-schedule rotates the audit logs on Monday, Wednesday, and Friday at 12:30 a.m. To clear time-based rotation parameters, you must explicitly set that portion to "-". Some time-based parameters can also be set to "all".

[-destination <text>] - Log Destination Path

This parameter specifies the audit log destination path where consolidated audit logs are stored. If the path is not valid, the command fails. The path can be up to 864 characters in length and must have read-write permissions.

[-events {file-ops|cifs-logon-logoff|cap-staging|file-share|audit-policy-change|user-account|authorization-policy-change|security-group}, ...] - Categories of Events to Audit

This parameter specifies the categories of events to be audited. Supported event categories are: file access events (both CIFS and NFS), CIFS logon and logoff events, Central Access Policy(CAP) staging events, File share events, Audit policy change events, Local User Account Management Events, Local Security Group Management Events and Authorization Policy Change Events. The corresponding parameter values are: *file-ops*, *cifs-logon-logoff*, *cap-staging*, *file-share*, *audit-policy-change*, *user-account*, *security-group* and *authorization-policy-change*. By default, *file-ops*, *cifs-logon-logoff* and *audit-policy-change* events are enabled

[-format {xml|evtx}] - Log Format

This parameter specifies the output format of the audit logs. The output format can be either Data ONTAP-specific XML or Microsoft Windows EVTX log format. By default, the output format is EVTX.

{ [-rotate-size {<integer>[KB|MB|GB|TB|PB]}] - Log File Size Limit

This parameter specifies the audit log file size limit. By default, the audit log is rotated based on size. The default audit log size is 100 MB.

[-rotate-schedule-month <cron_month>, ...] - Log Rotation Schedule: Month

This parameter specifies the monthly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated during the months January, March, and August, or during all the months. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, and all. Specify "all" to rotate the audit logs every month.

[-rotate-schedule-dayofweek <cron_dayofweek>, ...] - Log Rotation Schedule: Day of Week

This parameter specifies the daily (day of the week) schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on Tuesdays and Fridays, or during all the days of a week. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, and all. Specify "all" to rotate the audit logs every day.

[-rotate-schedule-day <cron_dayofmonth>, ...] - Log Rotation Schedule: Day

This parameter specifies the day of the month schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on the 10th and 20th days of a month, or all days of a month. Valid values range from 1 to 31.

[-rotate-schedule-hour <cron_hour>, ...] - Log Rotation Schedule: Hour

This parameter specifies the hourly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at 6 a.m and 10 a.m. Valid values range from 0 (midnight) to 23 (11:00 p.m.). Specify "all" to rotate the audit logs every hour.

[-rotate-schedule-minute <cron_minute>, ...] - Log Rotation Schedule: Minute

This parameter specifies the minute schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at the 30th minute. Valid values range from 0 to 59.

[-rotate-limit <integer>] - Log Files Rotation Limit

This parameter specifies the audit log files rotation limit. A value of 0 indicates that all the log files are retained. The default value is 0.

Examples

The following example modifies the rotate-size and rotate-limit field for Vserver vs1.

```
cluster1::> vserver audit modify -vserver vs1 -rotate-size 10MB -rotate-limit 3
```

The following example modifies an audit configuration for Vserver vs1 using the time-based rotation method. The audit logs are rotated monthly, all days of the week, at 12:30.

```
cluster1::> vserver audit modify -vserver vs1 -destination /audit_log -rotate-schedule-month all -rotate-schedule-dayofweek all -rotate-schedule-time 12:30
```

The following example modifies an audit configuration for Vserver vs1 for auditing CIFS and NFS file access events in the output log format EVTX.

```
cluster1::> vserver audit modify -vserver vs1 -format evtx -events file-ops
```

vserver audit prepare-to-downgrade

Restore the Audit configuration to Earlier Release of Data ONTAP

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `vserver audit prepare-to-downgrade` command restores the Audit configurations for ONTAP based on the input parameter `disable-feature-set`.

Parameters

-disable-feature-set <downgrade version> - Data ONTAP Version

This parameter specifies the ONTAP version that introduced the new Audit features and needs to be removed. The value can be one of the following:

- 9.0.0 - Disables the Audit features introduced in the ONTAP release 9.0.0. The following events are removed from the event list:
 - File share event. The corresponding parameter value is *file-share*.
 - Audit policy change event. The corresponding parameter value is *audit-policy-change*.
 - Local user account management event. The corresponding parameter value is *user-account*.
 - Local security group management event. The corresponding parameter value is *security-group*.
 - Authorization policy change event. The corresponding parameter value is *authorization-policy-change*.

Examples

```
cluster1::*> vserver audit prepare-to-downgrade -disable-feature-set 9.0.0
```

vserver audit rotate-log

Rotate audit log

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver audit rotate-log` command rotates audit logs for a Vserver.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for which audit logs are to be rotated. The Vserver audit configuration must already exist. Auditing must be enabled for the Vserver.

Examples

The following example rotates audit logs for Vserver vs1.

```
cluster1::> vserver audit rotate-log -vserver vs1
```

vserver audit show

Display the audit configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver audit show` command displays audit configuration information about Vservers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all the Vservers:

- Vserver name
- Audit state
- Target directory

You can specify the `-fields` parameter to specify which audit configuration information to display about Vservers. You can specify additional parameters to display only information that matches those parameters. For instance, to display information about the log file rotation size of a Vserver whose value matches 10 MB, run the command with the `-rotate-size 10MB` parameter.

You can specify the `-instance` parameter to display audit configuration information for all Vservers in list form.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

| [-log-save-details]

You can specify the `-log-save-details` parameter to display the following information about all the Vservers:

- Vserver name
- Rotation file size
- Rotation schedules
- Rotation limit

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information about the specified Vserver.

[-state {true|false}] - Auditing State

If you specify this parameter, the command displays information about the Vservers that use the specified audit state value.

[-destination <text>] - Log Destination Path

If you specify this parameter, the command displays information about the Vservers that use the specified destination path.

[-events {file-ops|cifs-logon-logoff|cap-staging|file-share|audit-policy-change|user-account|authorization-policy-change|security-group}, ...] - Categories of Events to Audit

If you specify this parameter, the command displays information about the Vservers that use the specified category of events that are audited. Valid values are *file-ops*, *cifs-logon-logoff*, *cap-staging*, *file-share*, *audit-policy-change*, *user-account*, *security-group* and *authorization-policy-change*. *audit-policy-change* will appear only in diag mode.

[-format {xml|evtX}] - Log Format

If you specify this parameter, the command displays information about the Vservers that use the specified log format.

[-rotate-size {<integer>[KB|MB|GB|TB|PB]}] - Log File Size Limit

If you specify this parameter, the command displays information about the Vservers that use the specified log file rotation size.

[-rotate-schedule-month <cron_month>, ...] - Log Rotation Schedule: Month

If you specify this parameter, the command displays information about the Vservers that use the specified month of the time-based log rotation scheme. Valid values are January, February, March, April, May, June, July, August, September, October, November, and December.

[-rotate-schedule-dayofweek <cron_dayofweek>, ...] - Log Rotation Schedule: Day of Week

If you specify this parameter, the command displays information about the Vservers that use the specified day of the week of the time-based log rotation scheme. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, and Saturday.

[-rotate-schedule-day <cron_dayofmonth>, ...] - Log Rotation Schedule: Day

If you specify this parameter, the command displays information about the Vservers that use the specified day of the month of the time-based log rotation scheme. Valid values range from 1 to 31.

[-rotate-schedule-hour <cron_hour>, ...] - Log Rotation Schedule: Hour

If you specify this parameter, the command displays information about the Vservers that use the specified hour of the time-based log rotation scheme. Valid values range from 0 (midnight) to 23 (11:00 p.m.).

[-rotate-schedule-minute <cron_minute>, ...] - Log Rotation Schedule: Minute

If you specify this parameter, the command displays information about the Vservers that use the specified minute of the time-based log rotation scheme. Valid values range from 0 to 59.

[-rotate-schedule-description <text>] - Rotation Schedules

If you specify this parameter, the command displays information about the Vservers that use the specified rotation schedules. This field is derived from the rotate-time fields.

[-rotate-limit <integer>] - Log Files Rotation Limit

If you specify this parameter, the command displays information about the Vservers that use the specified rotation limit value.

Examples

The following example displays the name, audit state, event types, log format, and target directory for all Vservers.

```
cluster1::> vserver audit show
```

Vserver	State	Event Types	Log Format	Target Directory
vs1	false	file-ops	evtX	/audit_log

The following example displays the Vserver names and details about the audit log for all Vservers.

```
cluster1::> vserver audit show -log-save-details
```

Vserver	Rotation File Size	Rotation Schedule	Rotation Limit
vs1	100MB	-	0

The following example displays in list form all audit configuration information about all Vservers.

```
cluster1::> vserver audit show -instance
```

```

    Vserver: vs1
    Auditing state: true
    Log Destination Path: /audit_log
    Categories of Events to Audit: file-ops
    Log Format: evtz
    Log File Size Limit: 100MB
    Log Rotation Schedule: Month: -
    Log Rotation Schedule: Day of Week: -
    Log Rotation Schedule: Day: -
    Log Rotation Schedule: Hour: -
    Log Rotation Schedule: Minute: -
    Rotation Schedules: -
    Log Files Rotation Limit: 0
```

vserver check commands

The check directory

vserver check lif-multitenancy commands

The lif-multitenancy directory

vserver check lif-multitenancy run

Run check for LIF multitenancy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The run command checks the specified Vserver to verify that it has connectivity to the configured external servers providing services such as Active Directory, NIS, and DNS. The output can consist of three types of messages. Failure messages indicate that a Vserver does not have the connectivity required to a server exporting a service. Warning messages indicate configuration or operational issues that are possible causes of the failures. A success message is displayed if the Vserver has network connectivity to each of the configured servers for each service.

You can use this command to verify configuration changes such as creating a Vserver or changing the configured servers for one or more services. It is also useful for diagnosing operational problems that result from failures that could be caused by the inability to make network connections to configured servers.

The services that are checked are DNS, NIS, CIFS preferred domain controllers, CIFS discovered domain controllers, KDC, Active Directory, Admin, Password, LDAP, and LDAP preferred Active Directory.

Only a single run for a Vserver is allowed to run in a cluster. If multiple runs are attempted for a Vserver, a message will be displayed indicating that a run is already in progress.

For each service, this command will ping each configured server until a successful ping is completed. In certain circumstances where a subnet is offline or LIFs are operationally down, this command may take a long time to run. In order to show that forward progress is being made, an activity indicator of a '.' is displayed for each ping sent.

The following fields are reported in table format. Some fields may not be relevant to a type of message and will consist of the text "-".

- Vserver name
- Service external server is exporting
- Address of external server
- Connectivity to that external server
- More information describing the problem
- Suggestions to remediate the problems
- Success when there are no problems

Parameters

-vserver <vserver> - Vserver

Use this parameter to specify the Vserver to check.

[-verbose {true|false}] - Show Positive and Negative Result (privilege: advanced)

When this parameter is specified the results of all connectivity tests will be displayed in the success and failure cases.

Examples

This is an example of a successful run:

```
cluster1::> vserver check lif-multitenancy run -vserver vs0
..
SUCCESS: All external servers are reachable.
```

This is an example of a run with warnings and failures that need to be corrected:

Vserver	Severity	Service	Address	LIF	Connected	Details
vs0	warning	-	-	vs0_lif1	-	operationally down
vs0	warning	-	-	vs0_lif2	-	operationally down
...						
vs0	failure	DNS	10.98.200.20	-	no	cache
...						
vs0	failure	NIS domain	10.98.13.53	-	no	cache

```
Error : command failed:  FAILURES FOUND.
You must correct these failures to avoid service disruptions
in DOT 8.3 and above.
Corrective actions may include:
- removing decommissioned external servers from the vserver
configuration
- restoring network interfaces that are down
- adding network interfaces or routes
- modifying the locations where network interfaces may reside
(through
adjusting failover groups/policies or changing the home-node or
auto-revert settings).
For assistance, please consult the 8.3 Upgrade Document,
or contact support personnel.
```

At advanced privilege, additional information for messages at all severities is displayed.

```
cluster1::*> vserver check lif-multitenancy run -vserver vs0 -verbose true
....
Vserver      Severity Service      Address      LIF          Connected Details
-----
vs0          info     DNS          10.98.200.20 vs0_lif1     yes        ping
....
vs0          info     NIS domain   10.98.13.53  vs0_lif1     yes        ping
SUCCESS: All external servers are reachable.
```

vserver check lif-multitenancy show

Show the summary of the latest multitenancy network run

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

You can view summary information about the latest completed run, or the run in progress for a Vserver. It will show the following fields:

- Vserver - Name of Vserver that was checked for LIF connectivity
- Start Time - Date And Time the run was started
- Status - Not Started, In Progress, Complete, or Aborted
- Success - Yes if the run has a Status of Complete with no failures. No if the run has a status of Complete with one or more failures.
- Updated - The date and time the scan was last updated.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver

Selects the summary information matching the specified Vserver.

[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time

Selects the summary information matching the specified date and time the run was started

[-status {not started|in progress|complete|aborted}] - Run Status

Selects the summary information matching the specified status of the run.

[-success {yes|no}] - Successful Run

Selects the summary information matching the specified success or failure of the run.

[-updated <MM/DD/YYYY HH:MM:SS>] - Run Updated

Selects the summary information matching the last time the run was still in progress.

Examples

This is what a successful run looks like:

```
cluster1::> vserver check lif-multitenancy show
Vserver      Start Time      Status      Success
-----
vs0
              7/16/2014 14:28:35    complete    yes
```

This is what a failed run looks like:

```
cluster1::> vserver check lif-multitenancy show
Vserver      Start Time      Status      Success
-----
vs0
              7/16/2014 14:40:55    complete    no
```

This is what specifying the Vserver looks like:

```
cluster1::> vserver check lif-multitenancy show -vserver vs0
```

```
Vserver: vs0
Start Time: 7/16/2014 14:40:55
Run Status: complete
Successful Run: no
```

Advanced privilege adds in the Updated field.

```
cluster1::*> vserver check lif-multitenancy show
Vserver      Start Time      Status      Success      Updated
-----
vs0
              7/16/2014 14:40:55
                    complete      no      7/16/2014 14:40:56
```

Diagnostic privilege adds in the Details field:

```
cluster1::*> vserver check lif-multitenancy show
Vserver      Start Time      Status      Success      Updated      Details
-----
vs0
              7/16/2014 14:40:55
                    complete      no      7/16/2014 14:40:56
                                                exit code is 1
```

vserver check lif-multitenancy show-results

Show the results of the latest multitenancy network run

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

You can view detailed information about the latest completed run, or the run for a Vserver.

- Vserver - name of vserver run was for
- Severity - severity of the message which is failure, warning, or info.
- Service - name of service that is being checked for connectivity
- Address - address of server configured for the above service that is being
- LIF - the LIF a successful connectivity check to the above server was made from
- Connected - true if there is connectivity, false if there is not
- Status - additional information useful for resolving issues

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver

Selects the messages matching the specified Vserver

[-severity <text>] - Severity

Selects the messages matching the specified severity of failure, warning, and info.

[-service <text>] - Service Name

Selects the messages matching the specified service.

[-address <text>] - Address of Server

Selects the messages matching the specified address.

[-lif <lif-name>] - Logical Interface

Selects the messages matching the specified LIF.

[-connected {yes|no}] - Vserver Connectivity

Selects the messages matching the specified connectivity.

[-status <text>] - Additional Information

Selects the messages matching the specified search criteria.

Examples

Runs that are successful will not have any content.

```
cluster1::> vserver check lif-multitenancy show-results -vserver vs0
This table is currently empty.
```

Successful runs made with -verbose true will show the LIF used to Ping the network address from.

```
cluster1::> vserver check lif-multitenancy show-results -vserver vs0
```

Vserver	Severity	Service	Network Address	Logical Interface	Connected	Status
vs0	info	DNS	10.98.200.20	vs0_lif1	yes	ping
	info	NIS domain	10.98.13.53	vs0_lif1	yes	ping

2 entries were displayed.

Successful runs made with -verbose true will show the LIF used to Ping the network address from.

```
cluster1::> vserver check lif-multitenancy show-results -vserver vs0
```

Vserver	Severity	Service	Network Address	Logical Interface	Connected	Status
vs0	info	DNS	10.98.200.20	vs0_lif1	yes	ping
	info	NIS domain	10.98.13.53	vs0_lif1	yes	ping

2 entries were displayed.

Runs that fail display each failure that needs to be fixed.

```
cluster1::> vserver check lif-multitenancy show-results -vserver vs0
```

Vserver	Severity	Service	Network Address	Logical Interface	Connected	Status
vs0	warning	-	-	vs0_lif1	-	operationally down
	warning	-	-	vs0_lif2	-	operationally down
	failure	DNS	10.98.200.20	-	no	cache
	failure	NIS domain	10.98.13.53	-	no	cache

4 entries were displayed.

vserver cifs commands

Manage the CIFS configuration of a Vserver

vserver cifs add-netbios-aliases

Add NetBIOS aliases for the CIFS server name

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs add-netbios-aliases` command creates or adds a list of NetBIOS aliases for the CIFS server name.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for which NetBIOS alias are to be created or added.

-netbios-aliases <NetBIOS>, ... - List of NetBIOS Aliases

This parameter specifies one or more NetBIOS aliases to be added to an existing list of NetBIOS aliases. A new list of NetBIOS aliases is created if the list is currently empty.

Examples

The following example creates a new list of NetBIOS aliases for Vserver vs_a.

```
cluster1::> cifs show -display-netbios-aliases

Vserver: vs_a

    Server Name: CIFS_SERVER
    NetBIOS Aliases: -

cluster1::> cifs add-netbios-aliases -netbios-aliases alias_1,alias_2,alias_3

cluster1::> cifs show -display-netbios-aliases

Vserver: vs_a

    Server Name: CIFS_SERVER
    NetBIOS Aliases: ALIAS_1, ALIAS_2, ALIAS_3
```

The following example adds several NetBIOS aliases for the CIFS server CIFS_SERVER on Vserver vs_a.

```
cluster1::> cifs add-netbios-aliases -netbios-aliases alias_4,alias_5,alias_6

cluster1::> cifs show -display-netbios-aliases

Vserver: vs_a

    Server Name: CIFS_SERVER
    NetBIOS Aliases: ALIAS_1, ALIAS_2, ALIAS_3, ALIAS_4,
                    ALIAS_5, ALIAS_6

cluster1::> vserver cifs add-netbios-aliases -vserver v1 -netbios-aliases alias_7

cluster1::> cifs show -display-netbios-aliases

Vserver: vs_a
```

Server Name: CIFS_SERVER
NetBIOS Aliases: ALIAS_1, ALIAS_2, ALIAS_3, ALIAS_4,
ALIAS_5, ALIAS_6, ALIAS_7

vserver cifs create

Create a CIFS server

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs create` command creates a CIFS server on a Vserver. When you create the CIFS server, you can add it to an existing CIFS domain, or you can join it to a workgroup. When you add it to an existing CIFS domain, the storage system prompts you to provide the credentials of a user account that has sufficient privileges to add computers to the `-ou` container within the `-domain` domain. The user account must have a password that cannot be empty. If the new CIFS server is joining a domain, this command might take several minutes to complete.

Note: Each Vserver can have only one CIFS server.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver on which to create the CIFS server. The Vserver must already exist.

-cifs-server <NetBIOS> - CIFS Server NetBIOS Name

This parameter specifies the name of the CIFS server (up to 15 characters).

{ -domain <TextNoCase> - Fully Qualified Domain Name

This parameter specifies the name of the Active Directory domain to associate with the CIFS server.

[-ou <text>] - Organizational Unit

This parameter specifies the organizational unit within the Active Directory domain to associate with the CIFS server. By default, this parameter is set to CN=Computers.

[-default-site <text>] - Default Site Used by LIFs Without Site Membership

This parameter specifies the site within the Active Directory domain to associate with the CIFS server if Data ONTAP cannot determine an appropriate site.

| -workgroup <NetBIOS> - Workgroup Name

This parameter specifies the name of the workgroup (up to 15 characters).

[-status-admin {down|up}] - CIFS Server Administrative Status

Use this parameter to specify whether the initial administrative status of the cifs server is up or down. The default setting is up.

[-comment <text>] - CIFS Server Description

This optional parameter specifies a text comment for the server. CIFS clients can see this CIFS server description when browsing servers on the network. The comment can be up to 48 characters long. If there is a space in the descriptive remark or the path, you must enclose the entire string in quotation marks.

[-netbios-aliases <NetBIOS>, ...] - List of NetBIOS Aliases

This parameter specifies a list of NetBIOS aliases, which are alternate names to the CIFS server name.

Examples

The following example creates a CIFS server CIFS_SERVER1 for Vserver vs1 and domain EXAMPLE.com.

```
cluster1::> vserver cifs create -vserver vs1 -cifs-server CIFS_SERVER1 -domain EXAMPLE.com
```

In order to create an Active Directory machine account for the CIFS server, you

must supply the name and password of a Windows account with sufficient privileges to add computers to the "CN=Computers" container within the "EXAMPLE.com" domain.

Enter the user name: Administrator

Enter the password:

The following example creates a CIFS server CIFSSERVER1 for Vserver vs1 and workgroup Sales:

```
cluster1::> vserver cifs create -vserver vs1 -cifs-server CIFSSERVER1 -workgroup Sales
```

vserver cifs delete

Delete a CIFS server

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs delete` command deletes a CIFS server.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver for the CIFS server you want to delete.

Examples

The following example deletes the CIFS server from a Vserver named vs1:

```
cluster1::> vserver cifs delete -vserver vs1
```

vserver cifs modify

Modify a CIFS server

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs modify` command modifies the site within the Active Directory domain to associate with the CIFS server if Data ONTAP cannot determine an appropriate site. You also can modify the name and ou of the CIFS server, join to a new domain or a workgroup, or rejoin to current domain. When a CIFS server is joining a domain, this command might take several minutes to complete.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver for the CIFS server whose associated site you want to modify.

[-cifs-server <NetBIOS>] - CIFS Server NetBIOS Name

This parameter specifies the name of the CIFS server (up to 15 characters). Before setting this parameter, the CIFS server must be stopped using the `vserver cifs modify -status-admin down` command. When the command completes successfully, the administrative status of the CIFS server is automatically set to *up*.

{ [-domain <TextNoCase>] - Fully Qualified Domain Name

This parameter specifies the fully qualified name of the Active Directory domain to associate with the CIFS server. Before setting this parameter, the CIFS server must be stopped using the `vserver cifs modify -status-admin down` command. When the command completes successfully, the administrative status of the CIFS server is automatically set to *up*.

[-ou <text>] - Organizational Unit

This parameter specifies the organization unit within the Active Directory domain to associate with the CIFS server. By default, this parameter is set to CN=Computers. Before setting this parameter, the CIFS server must be stopped using the `vserver cifs modify -status-admin down` command. When the command completes successfully, the administrative status of the CIFS server is automatically set to *up*. Modifications to this parameter are not supported for workgroup CIFS servers.

[-default-site <text>] - Default Site Used by LIFs Without Site Membership

This parameter specifies the site within the Active Directory domain to associate with the CIFS server if Data ONTAP cannot determine an appropriate site. Modifications to this parameter are not supported for workgroup CIFS servers.

[-workgroup <NetBIOS>] - Workgroup Name

This parameter specifies the name of the workgroup (up to 15 characters).

[-status-admin {down|up}] - CIFS Server Administrative Status

Use this parameter to modify the administrative status of the cifs server. Modify the administrator status to down to stop cifs access.

[-comment <text>] - CIFS Server Description

Use this parameter to modify the comment of the server.

Examples

The following example changes the default site and administrative status of the CIFS server associated with Vserver "vs1":

```
cluster1::> vserver cifs modify -vserver vs1 -default-site default -status-admin up
```

The following example modifies the Active Directory domain and ou for the CIFS server associated with Vserver "vs1". The administrative status of the CIFS server must be set to "down" to proceed with Active Directory domain modification. If the command completes successfully, the administrative status is automatically set to "up".

```
cluster1::> vserver cifs modify -vserver vs1 -domain example.com -ou ou=example_ou -cifs-server example -status-admin down
```

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "ou=example_ou" container within the "example.com" domain.

Enter the user name: administrator

Enter the password:

```
cluster1::>
```

The following example modifies the CIFS server associated with Vserver "vs1" from a domain to a workgroup. The administrative status of the CIFS server must be set to "down" for this command. If the command completes successfully, the administrative status is automatically set to "up".

```
cluster1::> vserver cifs modify -vserver vs1 -workgroup Sales -status-admin down
```

Warning: To enter workgroup mode, all domain-based features must be disabled and their configuration removed automatically by the system, including continuously-available shares, shadow copies, and AES. However, domain-configured share ACLs such as "EXAMPLE.COM\userName" will not work properly, but cannot be removed by Data ONTAP. Remove these share ACLs as soon as possible using external tools after the command completes. If AES is enabled, you may be asked to supply the name and password of a Windows account with sufficient privileges to disable it in the "EXAMPLE.COM" domain.

Do you want to continue? {y|n}: y

```
cluster1::>
```

The following example modifies the CIFS server associated with Vserver "vs1" from a workgroup to a domain. The administrative status of the CIFS server must be set to "down" for this command. If the command completes successfully, the administrative status is automatically set to "up".

```
cluster1::> vserver cifs modify -vserver vs1 -domain example.com -status-admin down
```

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "ou=example_ou" container within the "example.com" domain.

Enter the user name: administrator

Enter the password:

```
cluster1::>
```

The following example modifies the CIFS server name associated with Vserver "vs1" from above example. The administrative status of the CIFS server must be set to "down" to proceed with Active Directory domain modification. If the command completes successfully, the administrative status is automatically set to "up" and there will be a job running to update related configurations.

```
cluster1::> vserver cifs modify -vserver vs1 -cifs-server new_example -status-admin down
```

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "ou=example_ou" container within the "example.com" domain.

Enter the user name: administrator

Enter the password:

Successfully queued CIFS Server Modify job [id: xx] for CIFS server "NEW_EXAMPLE". To view the status of the job, use the "job show -id <jobid>" command.

```
cluster1::>
```

vserver cifs nbtstat

Display NetBIOS information over TCP connection

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs nbtstat` command displays information about NetBIOS over TCP (NBT) connections for the cluster. It displays the IP address associated with the interfaces, the IP addresses of the WINS servers in use, and information about the registered NetBIOS names for the cluster. You can use this command to troubleshoot NetBIOS name resolution problems.

Note: NetBIOS name service (NBNS) over IPv6 is not supported.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified node.

[-vserver <vserver name>] - Vserver

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified Vserver.

[-nbt-name <text>] - NBT Name

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS name.

[-netbios-suffix <Hex String>] - NetBIOS Suffix

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS suffix.

[-interface <IP Address>, ...] - Interfaces

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified IP address.

[-wins-servers <IP Address>, ...] - Servers

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified WINS servers.

[-server-state <text>, ...] - Server State (active, inactive)

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified WINS server state. The following are possible values for this parameter:

- active
- inactive

[-nbt-scope <text>] - NBT Scope

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS name scope.

[-nbt-mode <text>] - NBT Mode

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS name service mode. The following are possible values for this parameter:

- 'p' - Point to Point
- 'h' - Hybrid
- 'm' - Mixed
- 'b' - Broadcast

[-state <text>] - State

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS name registration state. The following are possible values for this parameter:

- must_register
- must_unregister
- wins
- broadcast
- name_released
- wins_conflict
- broadcast_conflict

[-time-left <integer>] - Time Left

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified registration time left in minutes with the WINS server.

[-type <text>] - Type

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified name registration type. The following are possible values for this parameter:

- registered
- active
- permanent
- group

Examples

The following example displays the NetBIOS name service information.

```
cluster1::> nbtstat
(vserver cifs nbtstat)

Vserver: vs1
Node: cluster1-01
Interfaces:
    10.10.10.32
    10.10.10.33
Servers:
    17.17.1.2 (active )
NBT Scope:
    [ ]
NBT Mode:
    [h]
NBT Name      NetBIOS Suffix  State      Time Left  Type
-----
CLUSTER_1     00              wins       57
CLUSTER_1     20              wins       57

Vserver: vs1
Node: cluster1-02
Interfaces:
    10.10.10.35
Servers:
    17.17.1.2 (active )
CLUSTER_1     00              wins       58
CLUSTER_1     20              wins       58
4 entries were displayed.
```

vserver cifs prepare-to-downgrade

Restore the CIFS Configurations to Earlier Release of Data ONTAP Version

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `vserver cifs prepare-to-downgrade` command restores the CIFS configurations for Data ONTAP based on the input parameter `disable-feature-set`.

Parameters

-disable-feature-set <downgrade version> - Data ONTAP Version

This parameter specifies the Data ONTAP release for which the CIFS configurations are restored. The value can be one of the following:

- 8.3.1 - Restores the CIFS configurations for Data ONTAP release 8.3.1. These features include:
 - FPolicy "close with read" filters from FPolicy events.

- CIFS server options `-guest-unix-user` and `-is-admin-users-mapped-to-root-enabled`.
- CIFS security option `is-smb-encryption-required`.
- Storage-Level Access Guard (SLAG) for qtrees.
- CIFS share property `encrypt-data`.
- 8.3.2 - Restores the CIFS configurations for Data ONTAP release 8.3.2. These features include:
 - CIFS server option `-grant-unix-group-perms-to-others`.
- 9.0.0 - Restores the CIFS configurations for Data ONTAP release 9.0.0. These features include:
 - Disable CIFS multichannel feature and close all multichannel connections.
 - Delete all the name-mapping entries that have a hostname or an address field configured.
 - Terminate all SMB 3.1 client connections.
 - Terminate all client connections that have large MTU negotiated.
 - Remove the symlink property `no-strict-security`.
 - Remove all symlink pathmap entries with locality `freelink`.

Examples

```
cluster1::*> vserver cifs prepare-to-downgrade -disable-feature-set 8.3.1
```

```
cluster1::*> vserver cifs prepare-to-downgrade -disable-feature-set 8.3.2
```

```
cluster1::*> vserver cifs prepare-to-downgrade -disable-feature-set 9.0.0
```

vserver cifs remove-netbios-aliases

Remove NetBIOS aliases

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs remove-netbios-aliases` command deletes NetBIOS aliases for the CIFS server.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver from which the list of NetBIOS aliases are deleted.

-netbios-aliases <NetBIOS>, ... - List of NetBIOS Aliases

This parameter specifies one or more NetBIOS aliases to be deleted. To delete all the NetBIOS aliases of a Vserver use '-'.

Examples

The following example deletes NetBIOS aliases for the CIFS server CIFS_SERVER on Vserver vs_a.

```
cluster1::> cifs show -display-netbios-aliases
```

```
Vserver: vs_a
```

```
Server Name: CIFS_SERVER
NetBIOS Aliases: ALIAS_1, ALIAS_2, ALIAS_3, ALIAS_4,
                  ALIAS_5, ALIAS_6, ALIAS_7
```

```
cluster1::> cifs remove-netbios-aliases -netbios-aliases alias_1,alias_3,alias_5
```

```
cluster1::> cifs show -display-netbios-aliases

Vserver: vs_a

    Server Name: CIFS_SERVER
    NetBIOS Aliases: ALIAS_2, ALIAS_4, ALIAS_6, ALIAS_7

cluster1::> cifs remove-netbios-aliases -netbios-aliases alias_7

cluster1::> cifs show -display-netbios-aliases

Vserver: vs_a

    Server Name: CIFS_SERVER
    NetBIOS Aliases: ALIAS_2, ALIAS_4, ALIAS_6

cluster1::> cifs remove-netbios-aliases -netbios-aliases -

cluster1::> cifs show -display-netbios-aliases

Vserver: vs_a

    Server Name: CIFS_SERVER
    NetBIOS Aliases: -
```

vserver cifs repair-modify

Repair a partially-failed Vserver CIFS server modify operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

Use this `vserver cifs repair-modify -vserver <vserver name>` command when the background job created during a Vserver CIFS server modify operation fails.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies a Vserver containing a configured CIFS server that has been modified.

Examples

The following example starts the CIFS server modify job on Vserver vs1 successfully:

```
cluster1::*> vserver cifs repair-modify -vserver vs1

Successfully queued CIFS Server Modify job [id: 10] for CIFS server "CIFSNAME1".
To view the status of the job, use the "job show -id <jobid>" command.

cluster1::*>
```

The following example fails the command with specific error:

```
cluster1::*> vserver cifs repair-modify -vserver vs2

Error: Job Out of memory. Failed to queue CIFS Server Modify Job for CIFS
server "CIFSNAME2". Retry the operation by running (privilege: advanced)
"vserver cifs repair-modify -vserver vs2".
Error: command failed: unable to save data

cluster1::*>
```

vserver cifs show

Display CIFS servers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs show` command displays information about CIFS servers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- CIFS server NetBIOS name
- Domain or workgroup name
- Authentication style

You can specify the `-fields` parameter to specify which fields of information to display about CIFS servers. In addition to the fields above, you can display the following fields:

- Default site
- Fully-qualified domain name

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about CIFS servers that are in the CIFS domain named RUBY, run the command with the `-domain-workgroup RUBY` parameter.

You can specify the `-instance` parameter to display all information for all CIFS servers in list form.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

| **[-display-netbios-aliases]**

If you specify this parameter, the command displays information about configured NetBIOS aliases.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information only about the CIFS servers for the specified Vserver.

[-cifs-server <NetBIOS>] - CIFS Server NetBIOS Name

If you specify this parameter, the command displays information only for CIFS servers that match the specified CIFS server NetBIOS name.

[-domain-workgroup <CIFS domain>] - NetBIOS Domain/Workgroup Name

If you specify this parameter, the command displays information only for CIFS servers that are in the specified NetBIOS domain or workgroup.

[-domain <TextNoCase>] - Fully Qualified Domain Name

If you specify this parameter, the command displays information only for CIFS servers that are in the specified domain.

[-ou <text>] - Organizational Unit

If you specify this parameter, the command displays information only for CIFS servers that are in the specified organizational unit.

[-default-site <text>] - Default Site Used by LIFs Without Site Membership

If you specify this parameter, the command displays information only for CIFS servers that have the specified default site.

[-workgroup <NetBIOS>] - Workgroup Name

If you specify this parameter, the command displays information only for CIFS servers that are in the specified workgroup.

[-auth-style {domain|workgroup|realm}] - Authentication Style

If you specify this parameter, the command displays information only for CIFS servers that match the specified authentication style.

[-status-admin {down|up}] - CIFS Server Administrative Status

If you specify this parameter, the command displays information only for CIFS servers that match the specified administrative status.

[-comment <text>] - CIFS Server Description

If you specify this parameter, the command displays information only for CIFS servers that match the specified comment field.

[-netbios-aliases <NetBIOS>, ...] - List of NetBIOS Aliases

If you specify this parameter, the command displays information only for CIFS servers that have specified NetBIOS alias.

Examples

The following example displays a subset of the information about all CIFS servers:

```
cluster1::> vserver cifs show
```

Vserver	Server Name	Domain/Workgroup Name	Authentication Style
vs1	CIFSSERVER1	EXAMPLE	domain

The following example displays all information about all CIFS-enabled Vservers in list form:

```
cluster1::> vserver cifs show -instance
```

```

Vserver: vs1
  CIFS Server NetBIOS Name: CIFSSERVER1
  NetBIOS Domain/Workgroup Name: EXAMPLE
  Fully Qualified Domain Name: EXAMPLE.COM
  Organizational Unit: CN=Computers
Default Site Used by LIFs Without Site Membership:
  Workgroup Name: -
  Authentication Style: domain
CIFS Server Administrative Status: up
CIFS Server Description:
List of NetBIOS Aliases: ALIAS_2, ALIAS_4, ALIAS_6
```

The following example displays the NetBIOS aliases for the CIFS server CIFSSERVER1

```
cluster1::> cifs show -display-netbios-aliases
```

```
Vserver: vs1
```

```

  Server Name: CIFSSERVER1
  NetBIOS Aliases: ALIAS_2, ALIAS_4, ALIAS_6
```

vserver cifs start

Start a CIFS server

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command starts the CIFS server on the specified Vserver. The CIFS server must already exist. To create a CIFS server, run “[vserver cifs create](#)” on page 1545.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies a Vserver containing a configured CIFS server that has been stopped.

Examples

The following example starts the CIFS server on Vserver vs1:

```
cluster1::> cifs start -vserver vs1
```

vserver cifs stop

Stop a CIFS server

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command stops the CIFS server on the specified Vserver.

Note: Established sessions will be terminated and their open files closed. Workstations with cached data will not be able to save those changes, which could result in data loss.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies a Vserver containing a configured CIFS server that is running.

Examples

The following example stops the CIFS server on Vserver vs1:

```
cluster1::> cifs stop -vserver vs1
```

BranchCache Commands

Manage CIFS BranchCache settings

The `vserver cifs branchcache` commands are used to manage the CIFS BranchCache service. BranchCache permits clients at a remote location to cache data locally to avoid repeated transfer of large data sets that are updated infrequently. CIFS BranchCache is disabled by default.

vserver cifs branchcache create

Create the CIFS BranchCache service

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs branchcache create` command creates the configuration for computing and retrieving BranchCache hash data. Only a single instance of the BranchCache service can be created on a Vserver.

The `vserver cifs branchcache create` command is not supported for Vservers with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the CIFS-enabled Vserver on which you want to set up the BranchCache service.

[-versions {v1-enable|v2-enable|enable-all}, ...] - Supported BranchCache Versions

This optional parameter specifies a list of versions of the BranchCache protocol that the storage system supports. The default is `enable-all`. This list can include one or more of the following:

- `v1-enable` - This option enables BranchCache Version 1.
- `v2-enable` - This option enables BranchCache Version 2.
- `enable-all` - This option enables all supported versions of BranchCache.

-hash-store-path <text> - Path to Hash Store

This parameter specifies an existing directory into which the hash data is stored. Read-only paths, such as snapshot directories, are not allowed.

[-hash-store-max-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of the Hash Store

This optional parameter specifies the maximum size to use for the hash data. If the size of the hash data exceeds this value, older hashes are deleted to make room for newer hashes. The default is 1 GB.

[-server-key <text>] - Encryption Key Used to Secure the Hashes

This optional parameter specifies a server key that the BranchCache service uses to prevent clients from impersonating the BranchCache server.

[-operating-mode <BranchCache Mode>] - CIFS BranchCache Operating Modes

This optional parameter specifies the mode in which the BranchCache service operates. The default is `per-share`. Possible values include:

- `disable` - This option disables the BranchCache service for the Vserver.
- `all-shares` - This option enables the BranchCache service for all the shares on this Vserver.
- `per-share` - This option enables the BranchCache service on a per-share basis. You can enable the BranchCache service on an existing share by adding the *branchcache* flag in the `-share-properties` parameter of the [“vserver cifs share modify” on page 1628](#) command.

Examples

The following example creates the BranchCache service on the Vserver named `vs1`. The path to the hash store is `/vs1_hash_store`.

```
cluster1::> vserver cifs branchcache create -vserver vs1 -hash-store-path /vs1_hash_store
```

The following example creates the BranchCache service on the Vserver `vs1`. The path to the hash store is `/vs_hash_store`. The service is enabled on all the shares of the Vserver, supports BranchCache version 2, supports a maximum of 1 GB of BranchCache hashes, and secures the hashes using the key "vs1 secret".

```
cluster1::> vserver cifs branchcache create -vserver vs1 -hash-store-path /vs1_hash_store -operating-mode all-shares -versions v2-enable -hash
```

vserver cifs branchcache delete

Stop and remove the CIFS BranchCache service

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs branchcache delete` command stops and removes the Vserver BranchCache configuration.

The `vserver cifs branchcache delete` command is not supported for Vservers with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the CIFS-enabled Vserver whose BranchCache configuration you want to remove.

-flush-hashes {true|false} - Delete Existing Hashes

This parameter specifies whether to keep or delete all existing hashes after deleting the BranchCache service.

Examples

The following example stops and removes the BranchCache service on the Vserver vs1. It also deletes all existing hashes.

```
cluster1::> vserver cifs branchcache delete -flush-hashes true -vserver vs1
```

vserver cifs branchcache hash-create

Force CIFS BranchCache hash generation for the specified path or file

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs branchcache hash-create` command causes the BranchCache service to compute hashes for a single file, for a directory, or for all the files in a directory structure if you specify the `-recurse` option.

The `vserver cifs branchcache hash-create` command is not supported for Vservers with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the CIFS-enabled Vserver on which the hash is computed.

-path <text> - Path of File or Directory to Hash

This parameter specifies the path of the directory or file for which hashes are to be computed. If a file is specified, the hashes are computed on the whole file. If a directory is specified, hashes are computed on all files within the directory.

-recurse {true|false} - Process All Files in the Directory Recursively

If this option is set to true and the `-path` parameter specifies a directory, hashes are computed recursively for all directories in the path.

Examples

The following example creates hashes for the file "report.doc":

```
cluster1::> vserver cifs branchcache hash-create -vserver vs1 -path /repository/report.doc -recurse false
```

The following example creates hashes for all the files in the directory "repository":

```
cluster1::> vserver cifs branchcache hash-create -vserver vs1 -path /repository -recurse false
```

The following example recursively creates hashes for all the files and directories inside the directory "documents":

```
cluster1::> vserver cifs branchcache hash-create -vserver vs1 -path /documents -recurse true
```

vserver cifs branchcache hash-flush

Flush all generated BranchCache hashes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs branchcache hash-flush` command deletes all hash data from the configured hash store.

The `vserver cifs branchcache hash-flush` command is not supported for Vservers with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the CIFS-enabled Vserver whose hash data is to be deleted.

Examples

The following example flushes all the hashes for Vserver vs1:

```
cluster1::> vserver cifs branchcache hash-flush -vserver vs1
```

vserver cifs branchcache modify

Modify the CIFS BranchCache service settings

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs branchcache modify` command modifies the configuration for computing and retrieving BranchCache hash data.

The `vserver cifs branchcache modify` command is not supported for Vservers with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the CIFS-enabled Vserver whose BranchCache service is to be modified.

[-versions {v1-enable|v2-enable|enable-all}, ...] - Supported BranchCache Versions

This optional parameter specifies a list of versions of the BranchCache protocol that the storage system supports. The default is `enable-all`. This list can include one or more of the following:

- `v1-enable` - This option enables BranchCache Version 1.
- `v2-enable` - This option enables BranchCache Version 2.
- `enable-all` - This option enables all supported versions of BranchCache.

[-operating-mode <BranchCache Mode>] - CIFS BranchCache Operating Modes

This optional parameter specifies the mode in which the BranchCache service operates. The default is `per-share`. Possible values include:

- `disable` - This option disables the BranchCache service for the Vserver.
- `all-shares` - This option enables the BranchCache service for all the shares on this Vserver.
- `per-share` - This option enables the BranchCache service on a per-share basis. You can enable the BranchCache service on an existing share by adding the *branchcache* flag in the `-share-properties` parameter of the [“vserver cifs share modify” on page 1628](#) command.

[-hash-store-max-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of the Hash Store

This optional parameter specifies the maximum size to use for the hash data. If the size of the hash data exceeds this value, older hashes are deleted to make room for newer hashes. The default is 1 GB.

[-flush-hashes {true|false}] - Delete Existing Hashes

This parameter specifies whether to keep or delete all the existing hashes. This must be set to true when modifying the server key.

[-hash-store-path <text>] - Path to Hash Store

This parameter specifies an existing directory into which the hash data is stored. Read-only paths, such as snapshot directories, are not allowed.

[-server-key <text>] - Encryption Key Used to Secure the Hashes

This optional parameter specifies a server key that the BranchCache service uses to prevent clients from impersonating the BranchCache server. If you specify this parameter, all existing hashes for the Vserver are deleted.

Examples

The following example modifies the BranchCache service on the Vserver named vs1. The path to the hash store is /vs1_hash_store_2, the server key used to secure the hashes is set to "new vs1 secret", all existing hashes are removed, the service supports all BranchCache versions, and is enabled on a per-share basis.

```
cluster1:> vservers cifs branchcache modify -vservers vs1 -hash-store-path /vs1_hash_store_2 -server-key "new vs1 secret" -flush-hashes
```

The following example modifies the BranchCache service on the Vserver vs1. The service is enabled on all the shares of the Vserver, supports BranchCache version 1, and supports a maximum of 1 TB of BranchCache hashes.

```
cluster1:> vservers cifs branchcache modify -vservers vs1 -operating-mode all-shares -versions v1-enable -hash-store-max-size 1TB
```

vservers cifs branchcache show

Display the CIFS BranchCache service status and settings

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vservers cifs branchcache show` command displays information about the BranchCache configuration for the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information:

- Operating Mode
- Allowed Versions
- Maximum Size
- Path

You can specify additional parameters to display only information that matches those parameters.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command displays only the fields that you specify.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

[-vservers <vservers name>] - Vserver

If you specify this parameter, the command displays information for the specified Vserver.

[-versions {v1-enable|v2-enable|enable-all}, ...] - Supported BranchCache Versions

If you specify this parameter, the command displays information for the Vservers that support the specified BranchCache versions.

[-hash-store-path <text>] - Path to Hash Store

If you specify this parameter, the command displays information for Vservers that store their hashes at the specified location.

[-hash-store-max-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of the Hash Store

If you specify this parameter, the command displays information for Vservers that have a maximum hash store size that is set to the specified value.

[-server-key <text>] - Encryption Key Used to Secure the Hashes

If you specify this parameter, the command displays information for Vservers that have the specified server key.

[-operating-mode <BranchCache Mode>] - CIFS BranchCache Operating Modes

If you specify this parameter, the command displays information for Vservers whose BranchCache configuration operates in the specified mode.

Examples

The following example displays a subset of the information about the BranchCache service in the cluster.

```
cluster1::> vserver cifs branchcache show
Vserver      Operating  Allowed  Max
            Mode      Versions Size    Path
-----
vs1          per_share enable_all 1GB /hash_dir/
```

The following example displays all information about all the Vservers with BranchCache configurations.

```
cluster1::> vserver cifs show -instance
Vserver: vs1
Supported Versions of BranchCache: enable_all
Path to Hash Store: /hash_dir/
Maximum Size of the Hash Store: 1GB
Encryption Key Used to Secure the Hashes: asdad
CIFS BranchCache Operating Modes: per_share
```

The following example displays information about BranchCache configurations that store the hash data at the location /branchcache_hash_store.

```
cluster1::> vserver cifs branchcache show -hash-store-path /branchcache_hash_store
Vserver      Operating  Allowed  Max
            Mode      Versions Size    Path
-----
vs1          per_share enable_all 1GB /branchcache_hash_store
```

vserver cifs character-mapping commands

Manage character mappings for invalid characters

vserver cifs character-mapping create

Create character mapping on a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs character-mapping create` command creates the CIFS character mapping for the specified volume on a particular Vserver.

Note: Choose target characters in the "Private Use Area" of Unicode in the following range: U+E0000...U+F8FF.

CAUTION:

The target Unicode characters must not appear in existing file names; otherwise, unwanted character mappings would occur, resulting in clients being unable to access mapped files. For example, if ":" is mapped to "-" but "-" appears in files normally, a Windows client using the mapped share to access a file named "a-b" would have its request mapped to the NFS name "a:b", which is not the desired file.

The `vserver cifs character-mapping create` command is not supported for FlexGroups or Vservers with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which a volume is located for which you are creating the character mapping. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume for which you are creating the character mapping.

-mapping <text>, ... - Character Mapping

This parameter specifies the mapping of the invalid CIFS filename characters to valid CIFS filename characters. The mapping consists of a list of source-target character pairs separated by ":". The characters are Unicode characters entered using hexadecimal digits. For example: 3C:E03C.

Note: The permissible Unicode character set for source mapping is: 0x01-0x19, 0x5C, 0x3A, 0x2A, 0x3F, 0x22, 0x3C, 0x3E, 0x7C, 0xB1.

Examples

The following example creates a character mapping for a volume vol1 on Vserver vs1.

```
cluster1::> vserver cifs character-mapping create -volume vol1 -mapping 3c:e17c, 3e:f17d, 2a:f745
cluster1::> vserver cifs character-mapping show
```

Vserver	Volume Name	Character Mapping
vs1	vol1	3c:e17c, 3e:f17d, 2a:f745

vserver cifs character-mapping delete

Delete character mapping on a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs character-mapping delete` command deletes the CIFS character mapping for the specified volume on a particular Vserver.

The `vserver cifs character-mapping delete` command is not supported for FlexGroups or Vservers with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which a Volume is located for which you are deleting the character mapping. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume for which you are deleting the character mapping.

Examples

The following example deletes all character mappings for a volume vol1 on Vserver vs1.

```
cluster1::> vserver cifs character-mapping delete -volume vol1
```

vserver cifs character-mapping modify

Modify character mapping on a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs character-mapping modify` command modifies the CIFS character mapping for the specified volume on a particular Vserver.

You can modify a particular volume's character mapping by specifying the following two parameters in the modify command:

- Vserver associated with the volume
- Name of the Volume

Note: Choose target characters in the "Private Use Area" of Unicode in the following range: U+E0000...U+F8FF.

CAUTION:

The target Unicode characters must not appear in existing file names; otherwise, unwanted character mappings would occur, resulting in clients being unable to access mapped files. For example, if ":" is mapped to "-" but "-" appears in files normally, a Windows client using the mapped share to access a file named "a-b" would have its request mapped to the NFS name "a:b", which is not the desired file.

The `vserver cifs character-mapping modify` command is not supported for FlexGroups or Vservers with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which a Volume is located for which you are modifying the character mapping. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume for which you are modifying the character mapping.

[-mapping <text>, ...] - Character Mapping

This parameter specifies the mapping of the invalid CIFS filename characters to valid CIFS filename characters. The mapping consists of a list of source-target character pairs separated by ":". The characters are Unicode characters entered using hexadecimal digits. For example: 3C:E03C.

Note: The permissible Unicode character set for source mapping is: 0x01-0x19, 0x5C, 0x3A, 0x2A, 0x3F, 0x22, 0x3C, 0x3E, 0x7C, 0xB1.

Examples

The following example modifies a character mapping for a volume vol1 on Vserver vs1.

```
cluster1::> vserver cifs character-mapping modify -volume vol1 -mapping 3c:e17d, 3e:f17e, 2a:f746
cluster1::> vserver cifs character-mapping show
```

Vserver	Volume Name	Character Mapping
vs1	vol1	3c:e17d, 3e:f17e, 2a:f746

vserver cifs character-mapping show

Display character mapping on volumes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs character-mapping show` command displays information about character mapping configured for volumes. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about character mapping configured for volumes:

- Vserver name
- Volume name
- Character mapping

Parameters

{ **[-fields <fieldname>, ...]**

If you specify this parameter, the command displays only the fields that you specify.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information about character mapping configured for all the volumes that belong to the specified Vserver.

[-volume <volume name>] - Volume Name

If you specify this parameter, the command displays information about the character mapping configured for all the volumes that match the specified volume name.

[-mapping <text>, ...] - Character Mapping

If you specify this parameter, the command displays information about the character mapping configured for all volumes that match the specified mapping.

Examples

The following example displays information about all character mappings configured for volumes

```
cluster1::> vserver cifs character-mapping show
```

Vserver	Volume Name	Character Mapping
vs1	vol1	3c:e17d, 3e:f17e

vserver cifs connection commands

Manage CIFS connections

vserver cifs connection show

Displays established CIFS connections

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs connection show` command displays information about established CIFS connections.

Parameters

{ [-fields <fieldname>, ...]

Use this parameter to display only the specified fields

| [-instance]}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Use this parameter to display information about CIFS connections on the specified node.

[-vserver <vserver name>] - Vserver

Use this parameter to display information about CIFS connections on the specified CIFS-enabled SVM.

[-connection-id <integer>] - Connection ID

Use this parameter to display information about CIFS connections that match the specified connection ID.

[-session-id <integer>, ...] - Session ID

Use this parameter to display information about CIFS connections that match the specified session ID.

[-workstation-ip <IP Address>] - Workstation IP Address

Use this parameter to display information about CIFS connections that are established through the specified data LIF IP address.

[-workstation-port <integer>] - Workstation Port Number

Use this parameter to display information about CIFS connections that are opened from the specified Port number.

[-lif-ip <IP Address>] - Incoming Data LIF IP Address

Use this parameter to display information about CIFS connections that are opened from the specified IP address.

[-network-context-id <integer>] - Network Context ID (privilege: advanced)

Use this parameter to display information about CIFS connections that match the specified network context ID.

Examples

The following example displays information about all CIFS connections:

```
cluster1::> vserver cifs connection show
Node:      node1
Vserver:   vs1
Connection Session
ID          IDs          Workstation IP Port    Workstation LIF IP
-----
127834      1,2          172.17.193.172 15536      10.53.50.42
```

The following example displays information about a CIFS connection at advanced privilege level:

```
cluster1::*> vserver cifs connection show
Node:      node1
Vserver:   vs1
Connection Session
ID          IDs          Workstation IP Port    Workstation LIF IP    Network
Context ID
-----
127834      1,2          172.17.193.172 15536      10.53.50.42 2
```

The following example displays information about a CIFS connection with session-id 1:

```
cluster1::*> vserver cifs connection show -session-id 1 -instance
```

Vserver: vs1

```
Node: node1
Connection ID: 127834
Session ID: 1
Workstation IP Address: 172.17.193.172
Workstation Port Number: 15536
Incoming Data LIF IP Address: 10.53.50.42
Network Context ID: 2
```

vserver cifs domain commands

Manage domain interaction

vserver cifs domain discovered-servers commands

Manage discovered servers

vserver cifs domain discovered-servers reset-servers

Reset and rediscover servers for a Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs domain discovered-servers reset-servers` command discards information the storage system has stored about domain controllers, LDAP, and NIS servers. After that, it begins the discovery process to reacquire current information about external servers.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver.

Examples

The following is an example use of this command. It produces no output.

```
cluster1::> vserver cifs domain discovered-servers reset-servers
cluster1::>
```

vserver cifs domain discovered-servers show

Display discovered server information

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs domain discovered-servers show` command displays information about the discovered servers for the CIFS domains of one or more Vservers. Server displays are grouped by node and Vserver, and each group is preceded by the node and Vserver identification. Within each grouping, the server display is limited to those associated with the domain specified by the domain parameter, if it is present.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node`

If you use this parameter, the command only displays servers for the specified node.

`[-vserver <vserver name>] - Vserver`

If you use this parameter, the command only displays servers for the specified Vserver.

`[-domain <TextNoCase>] - Fully Qualified Domain Name`

If you use this parameter, the command only displays servers in the specified domain.

`[-type {Unknown|KERBEROS|MS-LDAP|MS-DC|LDAP|NIS}] - Server Type`

If you use this parameter, the command only displays servers of the specified type.

`[-name <text>] - Server Name`

If you use this parameter, the command only displays servers the with the specified name. This can result in multiple lines because the same server may provide multiple services.

`[-address <InetAddress>] - Server Address`

If you use this parameter, the command only displays servers with the specified IP address. This can result in multiple lines because the same server may provide multiple services.

`[-preference {unknown|preferred|favored|adequate}] - Preference`

If you use this parameter, the command only displays servers of the specified preference level.

`[-status {OK|unavailable|slow|expired|undetermined|unreachable}] - Status`

If you use this parameter, the command only displays servers of the specified status.

`[-dc-functional-level {win2000|unknown|win2003|win2008|win2008r2|win2012|win2012r2|win2016|winthreshold}] - DC Functional Level`

If you use this parameter, the command only displays servers with the specified functional level.

`[-is-dc-read-only {true|false}] - Is DC Read Only`

If this parameter is set to true, the command only displays servers with read only domain controller. If set to false, the command only displays servers with writable domain controller.

Examples

The following example display shows the information provided by this command.

```
cluster1::> vserver cifs domain discovered-servers show
```

```
Node: node1
```

```
Vserver: vs1
```

Domain Name	Type	Preference	DC-Name	DC-Address	Status
" "	NIS	preferred	192.168.10.222	192.168.10.222	OK
example.com	MS-LDAP	adequate	DC-1	192.168.192.24	OK
example.com	MS-LDAP	adequate	DC-2	192.168.192.25	OK
example.com	MS-DC	adequate	DC-1	192.168.192.24	OK
example.com	MS-DC	adequate	DC-2	192.168.192.25	OK

5 entries were displayed.

vserver cifs domain discovered-servers discovery-mode commands

The discovery-mode directory

vserver cifs domain discovered-servers discovery-mode modify

Modify Server Discovery Mode

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `vserver cifs domain discovered-servers discovery-mode modify` command modifies the configuration for the server discovery mode of one or more Data Vservers.

Parameters

-vserver <vserver name> - Vserver

Use this parameter to specify the Vserver for which you want to modify the server discovery mode.

[-mode {all|site|none}] - Server Discovery Mode

Use this parameter to specify the server discovery mode for the Vserver. Following are the possible values for this parameter:

- all - Discover all the servers in the domain.
- site - Discover the servers local to the site.
- none - Discover nothing. Depend only on preferred-dc configured.

Examples

The following example disables server discovery for a Vserver.

```
cluster1::> vserver cifs domain discovered-servers discovery-mode modify -vserver vs1 -mode none
```

vserver cifs domain discovered-servers discovery-mode show

Display Server Discovery Mode

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `vserver cifs domain discovered-servers discovery-mode show` command displays information about the discovery mode servers for the CIFS domains of one or more Vservers.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If you use this parameter, the command only displays discovery mode for the specified Vserver.

[-mode {all|site|none}] - Server Discovery Mode

If you use this parameter, the command only displays Vservers with the specified mode.

Examples

The following example shows the server discovery mode for all Vservers.

```
cluster1::> vserver cifs domain discovered-servers discovery-mode show
Vserver      Mode
-----
vs1          all
vs2          site
vs3          none
3 entries were displayed.
```

vserver cifs domain name-mapping-search commands

Manage the list of trusted domains for name-mapping search

vserver cifs domain name-mapping-search add

Add to the list of trusted domains for name-mapping

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs domain name-mapping-search add` command adds one or more trusted domains to the list of trusted domains to be used in preference to all others by the specified Vserver for looking up Windows user names when performing Windows user to UNIX user name-mapping. If a list already exists for the specified vserver, the new list is merged with the existing list. This command is not supported for workgroup CIFS servers.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for which you want to add trusted domains.

-trusted-domains <domain name>, ... - Trusted Domains

This parameter specifies a comma-delimited list of fully-qualified domain names of the trusted domains for the home domain.

Examples

The following example adds two trusted domains (cifs1.example.com and cifs2.example.com) to the preferred list used by Vserver vs1:

```
cluster1::> vserver cifs domain name-mapping-search add -vserver vs1 -trusted-domains cifs1.example.com, cifs2.example.com
```

vserver cifs domain name-mapping-search modify

Modify the list of trusted domains for name-mapping search

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs domain name-mapping-search modify` command modifies the current list of trusted domains to be used in preference to all others by the specified Vserver to lookup Windows user names when performing Windows user to UNIX user name-mapping. The new list overwrites the existing list. This command is not supported for workgroup CIFS servers.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for which you want to modify the trusted domain list.

-trusted-domains <domain name>, ... - Trusted Domains

This parameter specifies a comma-delimited list of fully qualified domain names of the trusted domains of the home domain.

Examples

The following example modifies the trusted domain list used by Vserver vs1:

```
cluster1::> vserver cifs domain name-mapping-search modify -vserver vs1 -trusted-domains cifs3.example.com
```

vserver cifs domain name-mapping-search remove

Remove from the list of trusted domains for name-mapping search

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs domain name-mapping-search remove` command removes one or more trusted domains from the list used by the specified Vserver to lookup Windows user names when performing Windows user to UNIX user name-mapping. If a list of trusted domains is not provided, the entire trusted domain list for the specified Vserver is removed. This command is not supported for workgroup CIFS servers.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver from which you want to remove trusted domains.

[-trusted-domains <domain name>, ...] - Trusted Domains

This parameter specifies a comma-delimited list of trusted domains of the home domain.

Examples

The following example removes two trusted domains from the list used by Vserver vs1:

```
cluster1::> vserver cifs domain name-mapping-search remove -trusted-domains cifs1.example.com, cifs2.example.com
```

vserver cifs domain name-mapping-search show

Display the list of trusted domains for name-mapping searches

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs domain name-mapping-search show` command displays information about trusted domains of the home domain by Vserver.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

This parameter specifies the name of the Vserver for which you want to display information about the trusted domains.

[-trusted-domains <domain name>, ...] - Trusted domains

This parameter specifies a comma-delimited list of fully qualified domain names of trusted domains for which you want to display information.

Examples

The following example displays information about all preferred trusted domains:

```
cluster1::> vserver cifs domain name-mapping-search show
Vserver      Trusted Domains
-----
vserver_1    CIFS1.EXAMPLE.COM
```

vserver cifs domain password commands

Manage domain account password configuration for a CIFS server

vserver cifs domain password change

Generate a new password for the CIFS server's machine account and change it in the Windows Active Directory domain.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs domain password change` changes the domain account password for a CIFS server. This command is not supported for workgroup CIFS servers.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for whose CIFS server you want to change the domain account password.

Examples

The following example changes the password for the CIFS server on a Vserver named vs1.

```
cluster1::> vserver cifs domain password change -vserver vs1
```

```
cluster1::>
```

vserver cifs domain password reset

Reset the CIFS server's machine account password in the Windows Active Directory domain.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs domain password reset` command resets the domain account password for a CIFS server. This may be required if the password stored along with the machine account in the Windows Active Directory domain is changed or reset without the Vserver's knowledge. The operation requires the credentials for a user with permission to reset the password in the organizational unit (OU) that the machine account is a member of. This command is not supported for workgroup CIFS servers.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for whose CIFS server you want to reset the domain account password.

Examples

The following example resets the password for the CIFS server on a Vserver named vs1.

```
cluster1::> vserver cifs domain password reset -vserver vs1
```

```
Enter your user ID: Administrator
```

```
Enter your password:
```

```
cluster1::>
```

vserver cifs domain password schedule commands

The schedule directory

vserver cifs domain password schedule modify

Modify the domain account password change schedule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs domain password schedule modify` command enables you to modify a domain account password change schedule for a CIFS server. This command is not supported for workgroup CIFS servers.

Parameters

-vserver <vserver name> - Vserver

This specifies the name of the Vserver containing the CIFS server for which you want to change the domain account password.

[-is-schedule-enabled {true|false}] - Is Password Change Schedule Enabled

This specifies whether the domain account password change schedule is enabled.

[-schedule-weekly-interval <integer>] - Interval in Weeks for Password Change Schedule

This specifies the number of weeks after which the scheduled domain account password change must occur.

[-schedule-randomized-minute <integer>] - Minutes Within Which Schedule Start Can be Randomized

This specifies the minutes within which the scheduled domain account password change must begin.

[-schedule-day-of-week <cron_dayofweek>] - Day of Week for Password Change Schedule

This sets the day of week when the scheduled domain account password change occurs.

[-schedule-time-of-day <HH:MM:SS>] - Start Time for Password Change Schedule

This sets the time in HH:MM:SS at which the scheduled domain account password change starts.

Examples

The following example enables the domain account password change schedule and configures it to run at any time between 23:00:00 to 00:59:00 (one hour before midnight to one hour after midnight) on every 4th Sunday.

```
cluster1::> vserver cifs domain password schedule modify -is-schedule-enabled true -schedule-randomized-minute 120 -schedule-weekly-interval 4
```

vserver cifs domain password schedule show

Display the domain account password change schedule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs domain password schedule show` command displays the domain account password change schedule configuration. It displays the following fields:

- Vserver: Vserver for which the schedule is configured
- Schedule Enabled: Whether the schedule is enabled or disabled for this Vserver
- Schedule Interval: Weeks after which the password change schedule occurs again for this Vserver
- Schedule Randomized Within: Minutes within which the schedule must begin for this Vserver
- Schedule: Password change schedule currently set on this Vserver
- Last Successful Password Change/Reset Time: Time at which the last password change or reset happened successfully on this Vserver
- Warning: Warning message, applicable only when the change password job is deleted with the feature still enabled on this Vserver

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information for the specified Vserver.

[-is-schedule-enabled {true|false}] - Is Password Change Schedule Enabled

If you specify this parameter, the command displays information for all the Vservers on which the `is-schedule-enabled` value applies.

[-schedule-weekly-interval <integer>] - Interval in Weeks for Password Change Schedule

If you specify this parameter, the command displays information for all the Vservers on which the `schedule-weekly-interval` value applies.

[-schedule-randomized-minute <integer>] - Minutes Within Which Schedule Start Can be Randomized

If you specify this parameter, the command displays information for all the Vservers on which the `schedule-randomized-minute` value applies.

[-schedule-last-changed <text>] - Last Successful Password Change/Reset Time

If you specify this parameter, the command displays information for all the Vservers on which the `schedule-last-changed` value applies.

[-schedule-description <text>] - Schedule Description

If you specify this parameter, the command displays information for all the Vservers on which the `schedule-description` value applies.

[-schedule-warn-msg <text>] - Warning Message in Case Job Is Deleted

If you specify this parameter, the command displays information for all the Vservers on which the `schedule-warn-msg` value applies.

Examples

The following example shows the domain account password change schedule configuration when the password change feature is enabled for Vserver `vs1`.

```
cluster1::> vserver cifs domain password schedule show
```

```
Vserver: vs1

Schedule Enabled: true
Schedule Interval: 4   week
Schedule Randomized Within: 120 min
Schedule: Fri@23:00
Last Changed At: Thu Apr  4 02:35:23 2013
```

The following example shows the domain account password change schedule configuration when the password change job has been accidentally deleted.

```
cluster1::> vserver cifs domain password schedule show
```

```
Vserver: vs1

Schedule Enabled: true
Schedule Interval: 4   week
Schedule Randomized Within: 120 min
Schedule: Fri@23:00
Last Changed At: Thu Apr  4 02:35:23 2013
Warning: Password change job was deleted. Re-enable the password change schedule.
```

vserver cifs domain preferred-dc commands

Manage preferred domain controllers

vserver cifs domain preferred-dc add

Add to a list of preferred domain controllers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs domain preferred-dc add` command adds one or more domain controllers to be used in preference to all others by the specified Vserver for interactions with the specified domain. If a list already exists for the specified domain, the new list is merged with the existing list. This command is not supported for workgroup CIFS servers.

Note: Each Vserver discovers domain controllers and attempts to sort them internally based on real-world performance. Therefore it should not be necessary to create a preferred list of domain controllers under most circumstances.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for which you want to add preferred domain controllers.

-domain <TextNoCase> - Fully Qualified Domain Name

This parameter specifies the fully-qualified name of the domain that the domain controllers belong to.

-preferred-dc <InetAddress>, ... - Preferred Domain Controllers

This parameter specifies a comma-delimited list of IP addresses for domain controllers that belong to the domain specified in the `-domain` parameter.

Examples

The following example adds two domain controllers (192.168.0.100 and 192.168.0.101) to the preferred list used by Vserver vs1 when connecting to the example.com domain:

```
cluster1::> vserver cifs domain preferred-dc add -vserver vs1 -domain example.com -preferred-dc 192.168.0.100,192.168.0.101
```

vserver cifs domain preferred-dc remove

Remove from a list of preferred domain controllers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs domain preferred-dc remove` command removes one or more domain controllers from the list used by the specified Vserver for interactions with the specified domain. If a list of preferred domain controllers is not provided, the entire list for the specified domain is removed. This command is not supported for workgroup CIFS servers.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver from which you want to remove preferred domain controllers.

-domain <TextNoCase> - Fully Qualified Domain Name

This parameter specifies the fully-qualified name of the domain that the domain controllers belong to.

[-preferred-dc <InetAddress>, ...] - Preferred Domain Controllers

This parameter specifies a comma-delimited list of IP addresses for domain controllers that belong to the domain specified in the `-domain` parameter.

Examples

The following example removes one domain controller (192.168.0.101) from the preferred list used by Vserver vs1 when connecting to the example.com domain:

```
cluster1::> vserver cifs domain preferred-dc remove -vserver vs1 -domain example.com -preferred-dc 192.168.0.101
```

vserver cifs domain preferred-dc show

Display a list of preferred domain controllers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs domain preferred-dc show` command displays lists of preferred domain controllers by Vserver and domain.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

This parameter specifies the name of the Vserver for which you want to display preferred domain controllers.

[-domain <TextNoCase>] - Fully Qualified Domain Name

This parameter specifies the fully-qualified name of the domain of the domain controllers to display.

[-preferred-dc <InetAddress>, ...] - Preferred Domain Controllers

This parameter specifies a comma-delimited list of IP addresses for domain controllers to display.

Examples

The following example displays all preferred domain controllers for all Vservers:

```
cluster1::> vserver cifs domain preferred-dc show
Vserver      Domain Name      Preferred Domain Controllers
-----
vs1          example.com      192.168.0.100, 192.168.0.101
```

vserver cifs domain trusts commands

Manage discovered trusted domains

vserver cifs domain trusts rediscover

Reset and rediscover trusted domains for a Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs domain trusts rediscover` command discards information the Vserver has stored about trusted domains. After that, it begins the discovery process to reacquire current information about trusted domains. This command is not supported for workgroup CIFS servers.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver.

Examples

The following example rediscovers trusted domains. It produces no output.

```
cluster1::> vserver cifs domain trusts rediscover
```

vserver cifs domain trusts show

Display discovered trusted domain information

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs domain trusts show` command displays information about the trusted domains for the CIFS home domain of one or more Vservers. The displayed trusted domain information is grouped by node and Vserver, and each group is preceded by the node and Vserver identification. This command is not supported for workgroup CIFS servers.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

If you use this parameter, the command displays information only about trusted domains of the home domains for the specified node.

[-vserver <vserver name>] - Vserver

If you use this parameter, the command displays information only about trusted domains of the home domain for the specified Vserver.

[-home-domain <domain name>] - Home Domain Name

If you use this parameter, the command displays information only about trusted domains of the home domain with the specified name.

[-trusted-domain <domain name>, ...] - Trusted Domain Name

If you use this parameter, the command displays information only about trusted domains with the specified name.

Examples

The following example displays information about all the bidirectional trusted domains for node-01 and vserver_1.

```
cluster1::> vserver cifs domain trusts show -node node-01 -vserver vserver_1
```

```
Node: node-01
Vserver: vserver_1
```

Home Domain	Trusted Domain
EXAMPLE.COM	CIFS1.EXAMPLE.COM, CIFS2.EXAMPLE.COM

vserver cifs group-policy commands

Manage group policies

vserver cifs group-policy modify

Change group policy configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs group-policy modify` command modifies the group policy configuration of a CIFS server. This command is not supported for workgroup CIFS servers.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver whose group policy configuration you want to modify.

[-status {enabled|disabled}] - Group Policy Status

This parameter specifies whether the CIFS-enabled Vserver's group policy is enabled or disabled.

Examples

The following example enables the group policy for CIFS-enabled Vserver vs1.

```
cluster1::> vserver cifs group-policy modify -vserver vs1 -status enabled
```

vserver cifs group-policy show

Show group policy configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs group-policy show` command displays information about group policy configuration for CIFS-enabled Vserver. It displays all or a subset of the group policy configuration matching the criteria that you specify.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays group policy configuration only for the Vserver that you specify.

[-status {enabled|disabled}] - Group Policy Status

If you specify this parameter, the command displays group policy configuration only for the Vservers that match the status you specify.

Examples

The following example displays group policy configuration for all Vservers:

```
cluster1::> vserver cifs group-policy show
```

Vserver	GPO Status
vs1	disabled

vserver cifs group-policy show-applied

Show currently applied group policy setting

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs group-policy show-applied` command displays information about group policies assigned to a Vserver. It displays all or a subset of the group policy information matching the criteria that you specify.

If you do not specify any parameters, the command displays the following information about all group policies applied to Vservers in the cluster:

- **GPO Name:** Specifies the name of the Group Policy object.
- **Level:** Specifies the level in which the Group Policy is configured. It could be either site level, domain level, or OU level.
- **Status:** Specifies whether or not this Group Policy object is enabled.

Advanced Audit Settings:

- **Object Access:**
- **Central Access Policy Staging:** Specifies the type of events to be audited for central access policy staging. Possible values are:
 - none - Do not audit.
 - success - Audit only success events.
 - failure - Audit only failure events.
 - both - Audit both success and failure events.

Registry Settings:

- **Refresh Time Interval:** Specifies how often the Group Policy is updated.
- **Refresh Random Offset:** Specifies a random time that is added to the refresh interval to prevent all clients from requesting Group Policy updates at the same time.
- **Hash Publication Mode for BranchCache:** Specifies the hash generation mode used to generate hashes for data stored in shared folders on which BranchCache is enabled, which is then provided to clients. Possible values are:
 - per-share - Allow hash publication only for shared folders on which BranchCache is enabled.
 - disabled - Disallow hash publication on all shared folders.
 - all-shares - Allow hash publication for all shared folders.
- **Hash Version Support for BranchCache:** Specifies the version supported by the BranchCache hash generation service. Possible values are:
 - all-versions - Both versions 1 and 2 (V1 and V2).
 - version1 - Version 1 (V1).
 - version2 - Version 2 (V2).

Security Settings:

- **Event Audit and Event Log:**
- **Audit Logon Events:** Specifies the type of logon events to be audited. Possible values are:
 - none - Do not audit.
 - success - Audit only success events.
 - failure - Audit only failure events.
 - both - Audit both success and failure events.

- Audit Object Access: Specifies the type of object access to be audited. Possible values are:
 - none - Do not audit.
 - success - Audit only success events.
 - failure - Audit only failure events.
 - both - Audit both success and failure events.
- Log Retention Method: Specifies the audit log retention method. Possible values are:
 - overwrite-as-needed - Overwrite the event log when size of the log file exceeds the maximum log size.
 - overwrite-by-days - Not supported.
 - do-not-overwrite - Do not overwrite the event log.
- Max Log Size: Specifies the maximum size of the audit log. This size is displayed in kbytes.
- File Security: Specifies a list of files or directories on which file security is applied.
- Kerberos:
- Max Clock Skew: Specifies maximum tolerance in hours for computer clock synchronization.
- Max Ticket Age: Specifies maximum lifetime in minutes for user ticket.
- Max Renew Age: Specifies maximum lifetime in days for user ticket renewal.
- Privilege Rights:
- Take Ownership: List of users and groups that have the right to take ownership of any securable object in the system.
- Security Privilege: List of users and groups that can specify auditing options for object access of individual resources, such as files, folders, and Active Directory objects.
- Change Notify: List of users and groups that can traverse directory trees even though the users and groups might not have permissions on the traversed directory.
- Registry Values:
- Signing Required: Specifies whether SMB signing is on or off.
- Restrict Anonymous:
- No enumeration of Security Account Manager (SAM) accounts: This security setting determines what additional permissions are granted for anonymous connections to the computer. This option displays as 'no-enumeration' in Data ONTAP if enabled.
- No enumeration of SAM accounts and shares: This security setting determines whether anonymous enumeration of SAM accounts and shares is allowed. This option displays as 'no-enumeration' in Data ONTAP if enabled.
- Restrict anonymous access to shares and named pipes: This security setting restricts anonymous access to shares and pipes. This option displays as 'no-access' in Data ONTAP if enabled.
- Combined restriction for anonymous user: The combined restriction for the anonymous user is derived from the above three settings:
 - If 'no-access' is enabled, 'Combined restriction for anonymous user' is set to 'no-access'. The anonymous user is denied access to the specified shares and named pipes, and cannot use enumeration of SAM accounts and shares.
 - If 'no-enumeration' is enabled and 'no-access' is disabled, 'Combined restriction for anonymous user' is set to 'no-enumeration'. The anonymous user has access to the specified shares and named pipes, but cannot use enumeration of SAM accounts and shares.
 - If 'no-enumeration' is disabled and 'no-access' is disabled, 'Combined restriction for anonymous user' is set to 'no-restriction'. The anonymous user has full access and can use enumeration.

- Restricted Groups:
- List of restricted groups. For more information on each group, refer to the man page for the "vserver cifs group-policy restricted-group show-applied" command. Each group specifies two properties for restricted groups. The "Members" list defines who belongs and who does not belong to the restricted group. The "MemberOf" list ensures that the restricted group is added to the groups listed in "MemberOf" field. A group can be a member of groups other than those listed in "MembersOf" section.

Central Access Policy Settings:

- Policies:
 - Specifies a list of central access policies. Central access policies and rules determine access permissions for multiple files on the Vserver.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

| [-instance]}

If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays only group policy information that has been applied to the Vserver you specify.

[-gpo-index <integer>] - GPO Index

If you specify this parameter, the command displays only group policy information at gpo-index.

Examples

The following example displays all group policy information about all group policies that have been applied to a Vserver:

```
cluster1::> vserver cifs group-policy show-applied
```

```
Vserver: vs1
```

```

vserver cifs group-policy show-defined

Show applicable group policy settings defined in Active Directory

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs group-policy show-defined` command displays information about group policies that have been defined in Active Directory. It displays all or a subset of the group policy configuration matching the criteria that you specify.

If you do not specify any parameters, the command displays the following information about all group policies defined in Active Directory:

- GPO Name: Specifies the name of the Group Policy object.
- Level: Specifies the level in which the Group Policy is configured. It could be either site level, domain level, or OU level.
- Status: Specifies whether or not this Group Policy object is enabled.

Advanced Audit Settings:

- Object Access:
- Central Access Policy Staging: Specifies the type of events to be audited for central access policy staging. Possible values are:
 - none - Do not audit.
 - success - Audit only success events.
 - failure - Audit only failure events.
 - both - Audit both success and failure events.

Registry Settings:

- Refresh Time Interval: Specifies how often the Group Policy is updated.
- Refresh Random Offset: Specifies a random time that is added to the refresh interval to prevent all clients from requesting Group Policy updates at the same time.
- Hash Publication Mode for BranchCache: Specifies the hash generation mode used to generate hashes for data stored in shared folders on which BranchCache is enabled, which is then provided to clients. Possible values are:
 - per-share - Allow hash publication only for shared folders on which BranchCache is enabled.
 - disabled - Disallow hash publication on all shared folders.
 - all-shares - Allow hash publication for all shared folders.
- Hash Version Support for BranchCache: Specifies the version supported by the BranchCache hash generation service. Possible values are:
 - all-versions - Both versions 1 and 2 (V1 and V2).
 - version1 - Version 1 (V1).
 - version2 - Version 2 (V2).

Security Settings:

- Event Audit and Event Log:
- Audit Logon Events: Specifies the type of logon events to be audited. Possible values are:
 - none - Do not audit.
 - success - Audit only success events.
 - failure - Audit only failure events.
 - both - Audit both success and failure events.
- Audit Object Access: Specifies the type of object access to be audited. Possible values are:
 - none - Do not audit.
 - success - Audit only success events.
 - failure - Audit only failure events.
 - both - Audit both success and failure events.
- Log Retention Method: Specifies the audit log retention method. Possible values are:

- overwrite-as-needed - Overwrite the event log when size of the log file exceeds the maximum log size.
- overwrite-by-days - Not supported.
- do-not-overwrite - Do not overwrite the event log.
- Max Log Size: Specifies the maximum size of the audit log. This size is displayed in kbytes.
- File Security: Specifies a list of files or directories on which file security is to be applied.
- Kerberos:
- Max Clock Skew: Specifies maximum tolerance in hours for computer clock synchronization.
- Max Ticket Age: Specifies maximum lifetime in minutes for user ticket.
- Max Renew Age: Specifies maximum lifetime in days for user ticket renewal.
- Privilege Rights:
- Take Ownership: List of users and groups that have the right to take ownership of any securable object in the system.
- Security Privilege: List of users and groups that can specify auditing options for object access of individual resources, such as files, folders, and Active Directory objects.
- Change Notify: List of users and groups that can traverse directory trees even though the users and groups might not have permissions on the traversed directory.
- Registry Values:
- Signing Required: Specifies whether SMB signing is on or off.
- Restrict Anonymous:
- No enumeration of Security Account Manager (SAM) accounts: This security setting determines what additional permissions are granted for anonymous connections to the computer. This option displays as 'no-enumeration' in Data ONTAP if enabled.
- No enumeration of SAM accounts and shares: This security setting determines whether anonymous enumeration of SAM accounts and shares is allowed. This option displays as 'no-enumeration' in Data ONTAP if enabled.
- Restrict anonymous access to shares and named pipes: This security setting restricts anonymous access to shares and pipes. This option displays as 'no-access' in Data ONTAP if enabled.
- Combined restriction for anonymous user: The combined restriction for the anonymous user is derived from the above three settings:
 - If 'no-access' is enabled, 'Combined restriction for anonymous user' is set to 'no-access'. The anonymous user is denied access to the specified shares and named pipes, and cannot use enumeration of SAM accounts and shares.
 - If 'no-enumeration' is enabled and 'no-access' is disabled, 'Combined restriction for anonymous user' is set to 'no-enumeration'. The anonymous user has access to the specified shares and named pipes, but cannot use enumeration of SAM accounts and shares.
 - If 'no-enumeration' is disabled and 'no-access' is disabled, 'Combined restriction for anonymous user' is set to 'no-restriction'. The anonymous user has full access and can use enumeration.
- Restricted Groups:
- List of restricted groups. For more information on each group, refer to the man page for the "vserver cifs group-policy restricted-group show-defined" command. Each group specifies two properties for restricted groups. The "Members" list defines who belongs and who does not belong to the restricted group. The "MemberOf" list ensures that the restricted group is added to the groups listed in "MemberOf" field. A group can be a member of groups other than those listed in "MembersOf" section.

Central Access Policy Settings:

- Policies:
 - Specifies a list of central access policies. Central access policies and rules determine access permissions for multiple files on the Vserver.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

| [-instance]}

If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays only group policy information that has been defined in Active Directory for the Vserver that you specify.

[-gpo-index <integer>] - GPO Index

If you specify this parameter, the command displays only group policy information at gpo-index.

Examples

The following example displays all group policy information for all group policies that have been defined in Active Directory:

```
cluster1::> vserver cifs group-policy show-defined
```

```

vserver cifs group-policy update

Apply group policy settings defined in Active Directory

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs group-policy update` command applies the group-policy settings defined in Active Directory for the given Vserver. This command is not supported for workgroup CIFS servers.

Parameters

-vserver <vserver name> - Vserver Name

This parameter specifies the CIFS-enabled Vserver to which the group-policy settings be applied.

[-force-reapply-all-settings {true|false}] - Force Re-apply All Settings

This parameter specifies whether to ignore all processing optimizations and re-apply all settings. The default is false.

Examples

The following example applies the group-policy settings defined in Active Directory for Vserver vs1.

```
cluster1::> vserver cifs group-policy update -vserver vs1 -force-reapply-all-settings true
```

vserver cifs group-policy central-access-policy commands

Manage central access policy

vserver cifs group-policy central-access-policy show-applied

Show currently applied central access policies

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs group-policy central-access-policy show-applied` command displays information about the central access policies assigned to Vservers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- Name of the central access policy
- SID
- Description
- Creation time
- Modification time
- Member rules

Parameters

{ **[-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information only for central access policies for the specified Vserver.

[-name <TextNoCase>] - Name

If you specify this parameter, the command displays information only for central access policies that match the specified name.

[-sid <windows sid>] - Identifier

If you specify this parameter, the command displays information only for central access policies that match the specified SID.

[-description <text>] - Description

If you specify this parameter, the command displays information only for central access policies that match the specified description.

[-ctime <Date>] - Creation Time

If you specify this parameter, the command displays information only for central access policies that match the specified creation time.

[-mtime <Date>] - Modification Time

If you specify this parameter, the command displays information only for central access policies that match the specified modification time.

[-rules <TextNoCase>, ...] - Central Access Rules

If you specify this parameter, the command displays information only for central access policies that match the specified member rules.

Examples

The following example displays information for all central access policies:

```
cluster1::> vserver cifs group-policy central-access-policy show-applied
```

Vserver	Name	SID
vs1	p1	S-1-17-3386172923-1132988875-3044489393-3993546205
	Description: policy #1	
	Creation Time: Tue Oct 22 09:34:13 2013

	Modification Time: Thu Oct 31 10:25:32 2013	
	Member Rules: r1	
	r2	

2 entries were displayed.

vserver cifs group-policy central-access-policy show-defined

Show applicable central access policies defined in the Active Directory

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs group-policy central-access-policy show-defined` command displays information about the central access policies that are defined in the Active Directory. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- Name of the central access policy
- SID
- Description
- Creation time
- Modification time
- Member rules

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information only for central access policies for the specified Vserver.

[-name <TextNoCase>] - Name

If you specify this parameter, the command displays information only for central access policies that match the specified name.

[-sid <windows sid>] - Identifier

If you specify this parameter, the command displays information only for central access policies that match the specified SID.

[-description <text>] - Description

If you specify this parameter, the command displays information only for central access policies that match the specified description.

[-ctime <Date>] - Creation Time

If you specify this parameter, the command displays information only for central access policies that match the specified creation time.

[-mtime <Date>] - Modification Time

If you specify this parameter, the command displays information only for central access policies that match the specified modification time.

[-rules <TextNoCase>, ...] - Central Access Rules

If you specify this parameter, the command displays information only for central access policies that match the specified member rules.

Examples

The following example displays information for all central access policies:

```
cluster1::> vserver cifs group-policy central-access-policy show-defined

Vserver      Name      SID
-----
vs1          p1        S-1-17-3386172923-1132988875-3044489393-3993546205
      Description: policy #1
      Creation Time: Tue Oct 22 09:34:13 2013
      Modification Time: Wed Oct 23 08:59:15 2013
      Member Rules: r1

vs1          p2        S-1-17-1885229282-1100162114-134354072-822349040
      Description: policy #2
      Creation Time: Tue Oct 22 10:28:20 2013
      Modification Time: Thu Oct 31 10:25:32 2013
      Member Rules: r1
                  r2

2 entries were displayed.
```

vserver cifs group-policy central-access-rule commands

Manage central access rule

vserver cifs group-policy central-access-rule show-applied

Show currently applied central access rules

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs group-policy central-access-rule show-applied` command displays information about the central access rules assigned to Vservers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- Name of the central access rule

- Description
- Creation time
- Modification time
- Current permissions
- Proposed permissions
- Target resources

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

| [-instance]]

If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information only for central access rules for the specified Vserver.

[-name <TextNoCase>] - Name

If you specify this parameter, the command displays information only for central access rules that match the specified name.

[-description <text>] - Description

If you specify this parameter, the command displays information only for central access rules that match the specified description.

[-ctime <Date>] - Creation Time

If you specify this parameter, the command displays information only for central access rules that match the specified creation time.

[-mtime <Date>] - Modification Time

If you specify this parameter, the command displays information only for central access rules that match the specified modification time.

[-effective <text>] - Effective Security Policy

If you specify this parameter, the command displays information only for central access rules that match the specified effective security policy.

[-proposed <text>] - Proposed Security Policy

If you specify this parameter, the command displays information only for central access rules that match the specified proposed security policy.

[-resource <text>] - Resource Condition

If you specify this parameter, the command displays information only for central access rules that match the specified resource condition.

Examples

The following example displays information for all central access rules:

```
cluster1::> vsriver cifs group-policy central-access-rule show-applied
```

```
Vserver      Name
-----
vs1          r1
             Description: rule #1
             Creation Time: Tue Oct 22 09:33:48 2013
             Modification Time: Tue Oct 22 09:33:48 2013
             Current Permissions: 0:SYG:SYD:AR(A;;FA;;;WD)
             Proposed Permissions: 0:SYG:SYD:(A;;FA;;;OW)(A;;FA;;;BA)(A;;FA;;;SY)
```

```

vs1          r2
             Description: rule #2
             Creation Time: Tue Oct 22 10:27:57 2013
             Modification Time: Tue Oct 22 10:27:57 2013
             Current Permissions: 0:SYG:SYD:AR(A;;FA;;;WD)
             Proposed Permissions: 0:SYG:SYD:(A;;FA;;;OW)(A;;FA;;;BA)(A;;FA;;;SY)

```

2 entries were displayed.

vserver cifs group-policy central-access-rule show-defined

Show applicable central access rules defined in the Active Directory

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs group-policy central-access-rule show-defined` command displays information about the central access rules that are defined in the Active Directory. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- Name of the central access rule
- Description
- Creation time
- Modification time
- Current permissions
- Proposed permissions
- Target resources

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

| [-instance]

If you specify the `-instance` parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information only for central access rules for the specified Vserver.

[-name <TextNoCase>] - Name

If you specify this parameter, the command displays information only for central access rules that match the specified name.

[-description <text>] - Description

If you specify this parameter, the command displays information only for central access rules that match the specified description.

[-ctime <Date>] - Creation Time

If you specify this parameter, the command displays information only for central access rules that match the specified creation time.

[-mtime <Date>] - Modification Time

If you specify this parameter, the command displays information only for central access rules that match the specified modification time.

[-effective <text>] - Effective Security Policy

If you specify this parameter, the command displays information only for central access rules that match the specified effective security policy.

[-proposed <text>] - Proposed Security Policy

If you specify this parameter, the command displays information only for central access rules that match the specified proposed security policy.

[-resource <text>] - Resource Condition

If you specify this parameter, the command displays information only for central access rules that match the specified resource condition.

Examples

The following example displays information for all central access rules:

```
cluster1::> vsriver cifs group-policy central-access-rule show-defined
```

```
Vserver      Name
-----
vs1          r1
             Description: rule #1
             Creation Time: Tue Oct 22 09:33:48 2013
             Modification Time: Tue Oct 22 09:33:48 2013
             Current Permissions: 0:SYG:SYD:AR(A;;FA;;;WD)
             Proposed Permissions: 0:SYG:SYD:(A;;FA;;;OW)(A;;FA;;;BA)(A;;FA;;;SY)

vs1          r2
             Description: rule #2
             Creation Time: Tue Oct 22 10:27:57 2013
             Modification Time: Tue Oct 22 10:27:57 2013
             Current Permissions: 0:SYG:SYD:AR(A;;FA;;;WD)
             Proposed Permissions: 0:SYG:SYD:(A;;FA;;;OW)(A;;FA;;;BA)(A;;FA;;;SY)
```

2 entries were displayed.

vsvriver cifs group-policy restricted-group commands

Manage restricted group

vsvriver cifs group-policy restricted-group show-applied

Show the applied restricted-group settings.

Availability: This command is available to *cluster* and *Vsvriver* administrators at the *admin* privilege level.

Description

The `vsvriver cifs group-policy restricted-group show-applied` command displays settings of all the restricted groups applied to a Vsvriver.

If you do not specify any parameters, the command displays the following information about all the restricted groups applied to all the Vsvrivers in the cluster.

- Group Policy Name: Specifies the name of the group policy.
- Version: Specifies the version of the group policy.
- Link: Specifies the level in which the group policy is configured. Possible values are:
 - Local: Group policy is configured in Data ONTAP.
 - Site: Group policy is configured at the site level in the Domain Controller.
 - Domain: Group policy is configured at the domain level in the Domain Controller.
 - OrganizationalUnit: Group policy is configured at the OU level in the Domain controller.
 - RSOP: Resultant set of policies derived from all the group policies defined at various levels.

- **Group Name:** Specifies the name of a restricted group.
- **Members:** Specifies users and groups who belong to and who do not belong to the restricted group.
- **MemberOf:** Specifies list of groups to which the restricted group is added. A group can be a member of groups other than the groups listed here.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If this parameter is specified, the command displays the restricted-group information that has been applied to the specified Vserver.

[-index <integer>] - Index

If this parameter is specified, the command displays the specified index for the group policy in the restricted group. The restricted-group information for the group policy at the specified index.

[-group-name <text>] - Group Name

If this parameter is specified, the command displays the restricted-group information for the specified group name.

[-group-policy-name <text>] - Group Policy Name

If this parameter is specified, the command displays the restricted-group information for the specified group policy name.

[-uuid <UUID>] - UUID

If this parameter is specified, the command displays the restricted-group information for the specified UUID of the group policy.

[-version <integer>] - Version

If this parameter is specified, the command displays the restricted-group information for the specified version of the group policy.

[-link {Local|Site|Domain|OrganizationalUnit|RSOP}] - Link Type

If this parameter is specified, the command displays the restricted-group information for the specified link for the group policy.

[-members <gpoUserGroup>, ...] - Members, List of Users/groups

If this parameter is specified, the command displays the restricted-group information for the specified members of users and groups.

[-member-of <gpoUserGroup>, ...] - MemberOf, List of Groups

If this parameter is specified, the command displays the restricted-group information for the specified member of the group.

Examples

The following example displays information about all restricted groups that have been applied to a Vserver.

```
cluster1::> vserver cifs group-policy restricted-group show-applied
```

```
Vserver: vs_1
```

```
-----
```

```
Group Policy Name: gpo1
Version: 16
Link: OrganizationalUnit
```

```

Group Name: grp1
Members: usr1
MemberOf: GP0\g9

Group Policy Name: Resultant Set of Policy
Version: 0
Link: RSOP
Group Name: grp1
Members: usr1
MemberOf: GP0\g9

```

vserver cifs group-policy restricted-group show-defined

Show the defined restricted-group settings.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs group-policy restricted-group show-defined` command displays settings of all the restricted groups defined in Domain Controller for a Vserver.

If you do not specify any parameters, the command displays the following information about all the restricted groups defined in Domain Controller for all the Vservers in the cluster.

- Group Policy Name: Specifies the name of the group policy.
- Version: Specifies the version of the group policy.
- Link: Specifies the level in which the group policy is configured. Possible values are:
 - Local: Group policy is configured in Data ONTAP.
 - Site: Group policy is configured at the site level in the Domain Controller.
 - Domain: Group policy is configured at the domain level in the Domain Controller.
 - OrganizationalUnit: Group policy is configured at the OU level in the Domain Controller.
 - RSOP: Resultant set of policies derived from all the group policies defined at various levels.
- Group Name: Specifies the name of a restricted group.
- Members: Specifies users and groups who belong to and who do not belong to the restricted group.
- MemberOf: Specifies list of groups to which the restricted group is added. A group can be a member of groups other than the groups listed here.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If this parameter is specified, the command displays the restricted-group information that is defined in Domain Controller for the specified Vserver.

[-index <integer>] - Index

If this parameter is specified, the command displays the specified index for the group policy in the restricted group. The restricted-group information for the group policy at the specified index.

[-group-name <text>] - Group Name

If this parameter is specified, the command displays the restricted-group information for the specified group name.

[-group-policy-name <text>] - Group Policy Name

If this parameter is specified, the command displays the restricted-group information for the specified group policy name.

[-uuid <UUID>] - UUID

If this parameter is specified, the command displays the restricted-group information for the specified UUID of the group policy.

[-version <integer>] - Version

If this parameter is specified, the command displays the restricted-group information for the specified version of the group policy.

[-link {Local|Site|Domain|OrganizationalUnit|RSOP}] - Link Type

If this parameter is specified, the command displays the restricted-group information for the specified link for the group policy.

[-members <gpoUserGroup>, ...] - Members, List of Users/groups

If this parameter is specified, the command displays the restricted-group information for the specified members of users and groups.

[-member-of <gpoUserGroup>, ...] - MemberOf, List of Groups

If this parameter is specified, the command displays the restricted-group information for the specified member of the group.

Examples

The following example displays information about all restricted groups that are defined in Domain Controller for a Vserver.

```
cluster1::> vsriver cifs group-policy restricted-group show-defined
```

```
Vserver: vs_1
```

```
-----
```

```
Group Policy Name: gpo1
Version: 16
Link: OrganizationalUnit
Group Name: grp1
Members: usr1
MemberOf: GP0\g9
```

```
Group Policy Name: Resultant Set of Policy
Version: 0
Link: RSOP
Group Name: grp1
Members: usr1
MemberOf: GP0\g9
```

vsvrer cifs home-directory commands

Manage home directories

vsvrer cifs home-directory modify

Modify attributes of CIFS home directories

Availability: This command is available to *cluster* and *Vsvrer* administrators at the *admin* privilege level.

Description

The `vsvrer cifs home-directory modify` command modifies the CIFS home directory configuration for a CIFS server. To use the home directory options (-is-home-dirs-access-for-admin-enabled or/and -is-home-dirs-access-for-public-enabled), a home directory share must be configured with a dynamic share pattern

preceded by a tilde(~). Valid dynamic share patterns are ~%w and ~%d~%w. The pattern %u is not supported with these options.

Parameters

-vserver <vserver> - Vserver

This parameter specifies the name of the CIFS server for which you want to modify the CIFS home directory configuration.

[-is-home-dirs-access-for-admin-enabled {true|false}] - Is Home Directory Access for Admin Enabled

This optional parameter specifies whether a user with Windows administrative privileges can connect to another user's home directory. The default value for this parameter is *true*.

[-is-home-dirs-access-for-public-enabled {true|false}] - Is Home Directory Access for Public Enabled (privilege: advanced)

This optional parameter specifies whether any user can connect to another user's home directory. The default value for this parameter is *false*.

Examples

The following example modifies the CIFS home directory configuration for the Vserver "vs1". It enables users with Windows administrative privileges to connect to another user's home directory, and enables any user to connect to another user's home directory.

```
cluster1::> vsriver cifs home-directory modify -vserver vs1 -is-home-dirs-access-for-admin-enabled true
-is-home-dirs-access-for-public-enabled true
```

The following example shows the usage of the share creation pattern ~%d~%w.

```
cluster1::> vsriver cifs share create -vserver vs1 -share-name ~%d~%w -path %d/%w -share-properties homedirectory
```

The following example shows the usage of the share creation pattern ~%w.

```
cluster1::> vsriver cifs share create -vserver vs1 -share-name ~%w -path %d/%w -share-properties homedirectory
```

vserver cifs home-directory show

Display home directory configurations

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs home-directory show` command displays the CIFS home directory configuration for one or more Vservers.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver

If you specify this parameter, the command displays CIFS home directory configuration for the specified Vserver.

[-is-home-dirs-access-for-admin-enabled {true|false}] - Is Home Directory Access for Admin Enabled

If you specify this parameter, the command displays home directory configuration for CIFS servers that have the specified setting.

[-is-home-dirs-access-for-public-enabled {true|false}] - Is Home Directory Access for Public Enabled (privilege: advanced)

If you specify this parameter, the command displays home directory configuration for CIFS servers that have the specified setting.

Examples

The following example lists the CIFS home directory configuration for a Vserver on the cluster.

```
cluster1:> vserver cifs home-directory show -vserver vs1

Vserver: vs1
Is Home Directory Access for Admin Enabled: true
```

At the advanced privilege level or above, the output displays the information below:

```
cluster1::*> vserver cifs options show

Vserver: vs1
Is Home Directory Access for Admin Enabled: true
Is Home Directory Access for Public Enabled: false
```

vserver cifs home-directory show-user

Display the Home Directory Path for a User

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs home-directory show-user` command prints the path of a user's CIFS home directory. Use this command if multiple CIFS home directory paths exist and you want to see which path holds the user's CIFS home directory.

Parameters

{ [-fields <fieldname>, ...]

If you specify this parameter, the command displays only the fields that you specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all entries.

-vserver <vserver> - Vserver

Use this required parameter to specify the Vserver that contains the home directory of the user specified with the required `-username` parameter.

-username <text> - User Name

Use this required parameter to locate the home directory of the specified user. You must enter this parameter in the following format: `user, domain/user` or `cifs_server_name/user`.

[-path <text>] - Path

If you specify this parameter, the command displays information about the user's home directory with the specified path.

[-share-name <text>] - Share Name

If you specify this parameter, the command displays information about the user's home directory with the specified home-directory share.

Examples

The following command displays information about the home directory of user `gpo\rpuser1` belonging to Vserver `vs1`.

```
cluster1::> vsriver cifs home-directory show-user -vsriver vs1 -username gpo\rpuser1

Vserver   : vs1
Username  : GPO\rpuser1

ShareName      Home Dir Path
-----
root           /home/rpuser1
rpuser1        /home/rpuser1
~GPO~rpuser1   /home/GPO/rpuser1
```

The following command displays information about the home directory of user `gpo\rpuser1` belonging to Vserver `vs1` at share path `/home/rpuser1`.

```
cluster1::> vsriver cifs home-directory show-user -vsriver vs1 -username gpo\rpuser1 -path /home/rpuser1

Vserver   : vs1
Username  : GPO\rpuser1

ShareName      Home Directory Path
-----
root           /home/rpuser1
rpuser1        /home/rpuser1
2 entries were displayed.
```

The following command displays information about the home directory of user `gpo\rpuser1` belonging to Vserver `vs1` at share `~GPO~rpuser1`.

```
cluster1::> vsriver cifs home-directory show-user -vsriver vs1 -username gpo\rpuser1 -share-name ~GPO~rpuser1

Vserver   : vs1
Username  : GPO\rpuser1

ShareName      Home Directory Path
-----
~GPO~rpuser1   /home/GPO/rpuser1
```

vsvriver cifs home-directory search-path commands

Manage the list of paths used to find home directories

vsvriver cifs home-directory search-path add

Add a home directory search path

Availability: This command is available to *cluster* and *Vsvriver* administrators at the *admin* privilege level.

Description

The `vsvriver cifs home-directory search-path add` command adds a search path to a CIFS home directory configuration.

Parameters

-vsvriver <vsvriver name> - Vsvriver

This parameter specifies the CIFS-enabled Vsvriver containing the CIFS home directory configuration to which you want to add the search path.

-path <text> - Path

This parameter specifies the search path you want to add.

Examples

The following example adds the path /home1 to the CIFS home directory configuration on Vserver vs1.
cluster1::> vserver cifs home-directory search-path add -vserver vs1 -path /home1

vserver cifs home-directory search-path remove

Remove a home directory search path

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs home-directory search-path remove` command removes a search path from a CIFS home directory configuration.

Parameters**-vserver <vserver name> - Vserver**

This parameter specifies the CIFS-enabled Vserver containing the CIFS home directory configuration from which you want to remove the search path.

-path <text> - Path

This parameter specifies the search path you want to remove.

Examples

The following example removes the path /home1 from the CIFS home directory configuration on Vserver vs1.
cluster1::> vserver cifs home-directory search-path remove -vserver vs1 -path /home1

vserver cifs home-directory search-path reorder

Change the search path order used to find a match

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs home-directory search-path reorder` command moves a search path to a new position in the search path order in the CIFS home directory configuration for the CIFS-enabled Vserver.

Parameters**-vserver <vserver name> - Vserver**

This parameter specifies the CIFS enabled Vserver for which you want to reorder searches.

-path <text> - Path

This parameter specifies the search path you want to move.

-to-position <integer> - Target Position

This parameter specifies the new position of the search path in the search path order.

Examples

The following example moves the search path /home1 to position 1 in the search path order for the CIFS home directory configuration on Vserver vs1.
cluster1::> vserver cifs home-directory search-path reorder -vserver vs1 -path /home1 -to-position 1

vserver cifs home-directory search-path show

Display home directory search paths

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs home-directory search-path show` command displays information about the search paths that are in the home directory configuration for the CIFS-enabled Vservers.

Parameters

{ **[-fields <fieldname>, ...]**

If you specify this parameter, the command only displays the fields that you specify.

| **[-instance]**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays home directory configuration for the CIFS-enabled Vserver that you specify.

[-path <text>] - Path

If you specify this parameter, the command displays information only for the search path that you specify.

Examples

The following example displays information about search paths for all CIFS home directories on all CIFS-enabled Vservers:

```
cluster1::> vserver cifs home-directory search-path show
Vserver      Position Path
-----
vs1          1      /home1
vs2          2      /home2
```

vserver cifs options commands

Manage CIFS options

vserver cifs options modify

Modify CIFS options

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vserver cifs options modify` command modifies CIFS options for a CIFS server.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the CIFS server for which you want to modify CIFS options.

[-default-unix-user <text>] - Default UNIX User

This optional parameter specifies the name of the default UNIX user for the CIFS server.

[-read-grants-exec {enabled|disabled}] - Read Grants Exec for Mode Bits

This optional parameter specifies whether the CIFS server does read grant execution for mode bits.

[-wins-servers <InetAddress>, ...] - Windows Internet Name Service (WINS) Addresses

This optional parameter specifies a list of Windows Internet Name Server (WINS) addresses for the CIFS server. You must specify the WINS servers using an IP address. You can enter multiple WINS addresses as a comma-delimited list.

Note: Use an IPv4 address because WINS over IPv6 is not supported.

[-smb1-enabled {true|false}] - Enable SMB1 Protocol (privilege: advanced)

This optional parameter specifies whether the CIFS server negotiates the SMB 1.0 version of the CIFS protocol. The default value for this parameter is true for Vservers with Infinite Volume. For other data Vservers, the default value is false.

[-smb2-enabled {true|false}] - Enable all SMB2 Protocols (privilege: advanced)

This optional parameter specifies whether the CIFS server negotiates the SMB 2 version of the CIFS protocol. The default value for this parameter is true. This parameter is not supported for Vservers with Infinite Volume.

[-smb3-enabled {true|false}] - Enable SMB3 Protocol (privilege: advanced)

This optional parameter specifies whether the CIFS server negotiates the SMB 3 version of the CIFS protocol. The default value for this parameter is true. This parameter is not supported for Vservers with Infinite Volume.

[-smb31-enabled {true|false}] - Enable SMB3.1 Protocol (privilege: advanced)

This optional parameter specifies whether the CIFS server negotiates the SMB 3.1 version of the CIFS protocol. The default value for this parameter is true. This parameter is not supported for Vservers with Infinite Volume.

[-max-mpx <integer>] - Maximum Simultaneous Operations per TCP Connection (privilege: advanced)

This optional parameter specifies the maximum number of simultaneous operations the CIFS server reports it can process per TCP connection.

[-shadowcopy-dir-depth <integer>] - Maximum Depth of Directories to Shadow Copy (privilege: advanced)

This optional parameter specifies the maximum depth of directories on which to create shadow copies in the CIFS server. The default for this parameter is 5. The value 0 indicates that all sub-directories should be shadow copied. This parameter is not supported for Vservers with Infinite Volume and workgroup CIFS servers. Directories and files within a FlexGroup will not be shadow copied because FlexGroups do not support shadow copy.

[-copy-offload-enabled {true|false}] - Enable Copy Offload Feature (privilege: advanced)

This optional parameter enables the Copy Offload feature in the CIFS server. If set to false, the Copy Offload feature is disabled. The default for this parameter is true. This parameter is not supported for Vservers with Infinite Volume. Copy Offload has no effect on files in a FlexGroup because FlexGroups do not support Copy Offload.

[-is-copy-offload-direct-copy-enabled {true|false}] - Is Direct-copy Copy Offload Mechanism Enabled (privilege: advanced)

This optional parameter enables the direct-copy mechanism for ODX copy offload in the CIFS server. If set to false, the direct-copy mechanism is disabled. The default for this parameter is true. This parameter is not supported for Vservers with Infinite Volume. Copy Offload has no effect on files in a FlexGroup because FlexGroups do not support Copy Offload. The direct-copy mechanism increases the performance of the copy offload operation when Windows clients try to open the source file of a copy in a mode that prevents the file being changed while the copy is in progress. If turned off, regular copy offloading takes place.

[-default-unix-group <text>] - Default UNIX Group

This optional parameter specifies the name of the default UNIX group for the CIFS server. If you do not specify a default UNIX group, the CIFS ACL to NFSv4 ACL translation may result in incomplete NFSv4 ACL information. This parameter is not supported by Vservers with FlexVol volumes.

[-shadowcopy-enabled {true|false}] - Enable Shadow Copy Feature (VSS) (privilege: advanced)

This optional parameter enables the Shadow Copy (VSS) feature in the CIFS server when set to true. The VSS feature is disabled when set to false. The default for this parameter is true. This parameter is not supported for Vservers with Infinite Volume and workgroup CIFS servers. Directories and files within a FlexGroup will not be shadow copied because FlexGroups do not support shadow copy.

[-is-referral-enabled {true|false}] - Refer Clients to More Optimal LIFs (privilege: advanced)

This optional parameter specifies whether the CIFS server automatically refers clients to a data LIF local to the node which hosts the root of the requested share. The default value for this parameter is false. This parameter is not supported for Vservers with Infinite Volume.

`[-is-local-auth-enabled {true|false}] - Is Local User Authentication Enabled (privilege: advanced)`

This optional parameter specifies whether local user authentication is enabled for the CIFS server.

`[-is-local-users-and-groups-enabled {true|false}] - Is Local Users and Groups Enabled (privilege: advanced)`

This optional parameter specifies whether the local users and groups feature is enabled for the CIFS server.

`[-is-use-junctions-as-reparse-points-enabled {true|false}] - Is Reparse Point Support Enabled (privilege: advanced)`

This optional parameter specifies whether the CIFS server exposes junction points to Windows clients as reparse points. The default value for this parameter is true. This parameter is only active if the client has negotiated use of the SMB 2 or SMB 3 protocol. This parameter is not supported for Vservers with Infinite Volume.

`[-is-exportpolicy-enabled {true|false}] - Is Export Policies for CIFS Enabled (privilege: advanced)`

This optional parameter specifies whether the CIFS server uses export policies to control client access. The default value for this parameter is false.

`[-is-unix-nt-acl-enabled {true|false}] - Is NT ACLs on UNIX Security-style Volumes Enabled (privilege: advanced)`

This optional parameter specifies whether the CIFS server has the NT ACLs enabled on UNIX security-style volumes. The default value for this parameter is true.

`[-is-trusted-domain-enum-search-enabled {true|false}] - Is Enumeration of Trusted Domain and Search Capability Enabled (privilege: advanced)`

This optional parameter specifies whether the CIFS server supports enumeration of bidirectional trusted domains. It also supports the search in all the bidirectional trusted domains when performing Windows user lookups for UNIX user to Windows user name mapping. The default value is true. This parameter is not supported for workgroup CIFS servers.

`[-client-session-timeout <integer>] - Idle Timeout Before CIFS Session Disconnect (secs)`

This optional parameter specifies the amount of idle time (in seconds) before a CIFS session is disconnected. The default value for this parameter is 900 seconds.

`[-is-dac-enabled {true|false}] - Is Dynamic Access Control (DAC) Enabled (privilege: advanced)`

This optional parameter enables the Dynamic Access Control (DAC) feature in the CIFS server when set to true. The DAC feature is disabled when set to false. The default for this parameter is false. This parameter is not supported for Vservers with Infinite Volume and workgroup CIFS servers.

`[-restrict-anonymous {no-restriction|no-enumeration|no-access}] - Restrictions for Anonymous User (privilege: advanced)`

This optional parameter controls the access restrictions of non-authenticated sessions and applies the restrictions for the anonymous user based on the permitted values. The default value for this parameter is no-restriction. Permitted values for this option are:

- no-restriction - This option specifies no access restriction for anonymous users (default).
- no-enumeration - This option specifies that only enumeration is restricted.
- no-access - This option specifies that access is restricted for anonymous users.

`[-is-read-only-delete-enabled {enabled|disabled}] - Is Deletion of Read-Only Files Enabled`

This optional parameter controls deletion of read-only files and directories. NTFS delete semantics forbid deletion of a file or directory when the read-only attribute is set. UNIX delete semantics ignore it, focusing instead on parent directory permissions, which some applications require. This option is used to select the desired behavior. By default this option is disabled, yielding NTFS behavior.

[-file-system-sector-size {512|4096 (in bytes)}] - Size of File System Sector Reported to SMB Clients (bytes) (privilege: advanced)

This optional parameter specifies the size of file system sector reported to SMB clients (in bytes). The default value for this parameter is 4096. Valid values are 512 and 4096.

[-is-fake-open-enabled {true|false}] - Is Fake Open Support Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server supports fake open requests. This parameter allows you to optimize the open and close requests coming from SMB 2 clients. The default value for this parameter is true.

[-is-unix-extensions-enabled {true|false}] - Is UNIX Extensions Enabled (privilege: advanced)

When set to true, this optional parameter enables the UNIX Extensions feature in the CIFS server. If set to false, the UNIX Extensions feature is disabled. The default for this parameter is false. UNIX Extensions allows POSIX/UNIX style security to be displayed through the CIFS protocol.

[-is-search-short-names-enabled {true|false}] - Is Search Short Names Support Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server supports searching short names. A search query with this option enabled will try to match 8.3 file names along with long file names. The default value for this parameter is false.

[-is-advanced-sparse-file-support-enabled {true|false}] - Is Advanced Sparse File Support Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server supports the advanced sparse file capabilities. This allows CIFS clients to query the allocated ranges of a file and to write zeroes or free data blocks for ranges of a file.

[-is-fsctl-file-level-trim-enabled {true|false}] - Is Fsctl File Level Trim Enabled (privilege: advanced)

This optional parameter specifies whether trim requests (FSCTL_FILE_LEVEL_TRIM) are supported on the CIFS server.

[-guest-unix-user <text>] - Map the Guest User to Valid UNIX User (privilege: advanced)

This optional parameter specifies that an unauthenticated user coming from any untrusted domain can be mapped to a specified UNIX user for the CIFS server. If the CIFS server cannot authenticate the user against a domain controller for the home domain or a trusted domain or the local database, and this option is enabled, the CIFS server considers the user as a guest user and maps the user to the specified UNIX user. The UNIX user must be a valid user.

[-smb1-max-buffer-size <integer>] - Maximum Buffer Size Used for SMB1 Message (privilege: advanced)

This optional parameter specifies the maximum buffer size used for an SMB 1.0 message that the CIFS server can receive. If the LARGE_READ or LARGE_WRITE capability is negotiated during session setup, then 'Read' or 'Write' SMB 1.0 operations are allowed to exceed the configured 'smb1-max-buffer-size' value. This parameter does not have any effect on SMB 2 or SMB 3 buffer size. The default value for this parameter is 65535. The supported range for this parameter is 4356 through 65535.

[-max-same-user-sessions-per-connection <integer>] - Maximum Same User Sessions per TCP Connection (privilege: advanced)

This optional parameter specifies the maximum number of CIFS sessions that can be set up by the same user per TCP connection. The default value of this parameter is 2500. The maximum value of this parameter is 4294967295.

[-max-same-tree-connect-per-session <integer>] - Maximum Same Tree Connect per Session (privilege: advanced)

This optional parameter specifies the maximum number of CIFS tree connects to the same share per CIFS session. The default value of this parameter is 5000. The maximum value of this parameter is 4294967295.

[-max-opens-same-file-per-tree <integer>] - Maximum Opens on Same File per Tree (privilege: advanced)

This optional parameter specifies the maximum number of existing opens on the same file per CIFS tree. The default value of this parameter is 1000. The maximum value of this parameter is 4294967295.

`[-max-watches-set-per-tree <integer>]` - Maximum Watches Set per Tree (privilege: advanced)

This optional parameter specifies the maximum number of watches, also known as change notifies, that can be set per CIFS tree. Tree here refers to a share connect from a single client. The default value of this parameter is 500. The maximum value of this parameter is 4294967295.

`[-is-admin-users-mapped-to-root-enabled {true|false}]` - Map Administrators to UNIX User 'root' (privilege: advanced)

If this optional parameter is set to true, Windows users who are members of the "BUILTIN\Administrators" group are mapped to UNIX user 'root' unless a user who is a member of this group is explicitly mapped to a UNIX user. If a Windows user is a member of the "BUILTIN\Administrators" group and an explicit user mapping exists for that user, the explicit name mapping takes precedence. If this parameter is set to false, users that are members of the "BUILTIN\Administrators" group are not mapped to UNIX 'root'. The default value for this parameter is true.

`[-is-advertise-dfs-enabled {true|false}]` - (DEPRECATED)-Enable DFS Referral Advertisement (privilege: advanced)

This optional parameter specifies whether to advertise DFS referral of the CIFS protocol. The default value for this parameter is false. This option is not applicable to SMB 1.0.

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. The functionality provided by this parameter is now controlled by the `-symlink-properties` parameter instead.

`[-is-path-component-cache-enabled {true|false}]` - Is Path Component Cache Enabled (privilege: advanced)

This optional parameter specifies whether the path component cache is enabled. The default value for this parameter is true.

`[-win-name-for-null-user <TextNoCase>]` - Map Null User to Windows User or Group (privilege: advanced)

This optional parameter specifies a valid Windows user or group name that will be added to the CIFS credentials for a NULL user Session.

`[-is-hide-dotfiles-enabled {true|false}]` - Is Hide Dot Files Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server supports hiding dot files. Directory enumeration with this option enabled hides files and directories that begin with a dot ("."). The default value for this parameter is false.

`[-is-client-version-reporting-enabled {true|false}]` - Is Client Version Reporting Enabled (privilege: advanced)

If this parameter is set to true, CIFS client version tracking information is collected by AutoSupport. The default value of this parameter is true.

`[-is-client-dup-detection-enabled {true|false}]` - Is Client Duplicate Session Detection Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server supports duplicate session detection. Duplicate sessions that come from the same client with VcNumber of zero with this option enabled will be closed, and is only applicable for SMB 1.0 clients. The default value for this parameter is true.

`[-grant-unix-group-perms-to-others {true|false}]` - Grant UNIX Group Permissions to Others (privilege: advanced)

This optional parameter specifies whether the incoming CIFS user who is not the owner of the file, can be granted the group permission. If the CIFS incoming user is not the owner of UNIX security-style file and this option is set to true, then at all times the file's "group" permissions are granted. If the CIFS incoming user is not the owner of UNIX security-style file and this option is set to false, then the normal UNIX rules are applicable to grant the permissions. The default value of this parameter is false.

`[-is-multichannel-enabled {true|false}]` - Is Multichannel Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server supports Multichannel or not. The default value for this parameter is false.

[-max-connections-per-session <integer>] - Maximum Connections Allowed Per Multichannel Session (privilege: advanced)

This optional parameter specifies the maximum number of connections allowed per Multichannel session. The default value for this parameter is 32.

[-max-lifs-per-session <integer>] - Maximum LIFs Advertised Per Multichannel Session (privilege: advanced)

This optional parameter specifies the maximum number of network interfaces advertised per Multichannel session. The default value for this parameter is 256.

[-is-large-mtu-enabled {true|false}] - Is Large MTU Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server supports the SMB 2.1 "large MTU" feature. The default value for this parameter is false. This parameter is not supported for Vservers with Infinite Volume.

[-is-netbios-over-tcp-enabled {true|false}] - Is NetBIOS over TCP (port 139) Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server supports the NetBIOS over TCP (port 139) feature. The default value for this parameter is true.

[-is-nbns-enabled {true|false}] - Is NBNS over UDP (port 137) Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server supports the NBNS protocol. The default value for this parameter is false.

[-widelink-as-reparse-point-versions <CIFS Dialects>, ...] - Protocol Versions for Which Widelink Will Be Reported as Reparse Point (privilege: advanced)

This optional parameter specifies the CIFS protocol versions for which the widelink is reported as reparse point. The default value for this parameter is *SMB1*.

Note: Any values entered for this parameter is replaced with the existing values.

[-max-credits <integer>] - Maximum Credits to Grant (privilege: advanced)

This optional parameter specifies the maximum number of outstanding requests on a CIFS connection. The default value for this parameter is 128.

Examples

The following example modifies CIFS options for the Vserver "vs1". It changes the default UNIX user, disables read grants exec, disables SMB2.x, changes maximum multiplex count to 1124, changes the file system sector size reported to SMB clients to 512, disables the direct-copy offload mechanism for ODX copy offload, enables the UNIX Extensions feature, disables fake open requests changes WINS servers to 192.168.11.112 and changes the client session timeout to 6000.

```
cluster1::> vserver cifs options modify -vserver vs1
-default-unix-user pcuser -read-grants-exec disabled
-smb2-enabled false -max-mpx 1124 -file-system-sector-size
512 -is-copy-offload-direct-copy-enabled false
-is-unix-extensions-enabled true -is-fake-open-enabled false
-wins-servers 192.168.11.112 -client-session-timeout 6000
```

The following example modifies CIFS options for the Vserver "vs1". It enables the advanced sparse file support.

```
cluster1::> vserver cifs options modify -vserver vs1
-is-advanced-sparse-file-support-enabled true
```

The following example modifies CIFS options for the Vserver "vs1". It modifies limits for maximum opens on the same file, max sessions by the same user, max tree connects per session, and max watches set.

```
cluster1::> vsserver cifs options modify -vsserver vs1
-max-same-user-sessions-per-connection 100
-max-same-tree-connect-per-session 100 -max-opens-same-file-per-tree 150
-max-watches-set-per-tree 200
```

The following example modifies CIFS options for the Vserver "vs1". It modifies the option to disable the path component cache. .

```
cluster1::> vsserver cifs options modify -vsserver vs1
-is-path-component-cache-enabled false
```

The following example modifies CIFS options for the Vserver "vs1". It modifies the option to disable CIFS client version tracking.

```
cluster1::> vsserver cifs options modify -vsserver vs1
-is-client-version-reporting-enabled false
```

The following example modifies CIFS option for the Vserver "vs1". It modifies the option to enable granting of UNIX group permissions to others.

```
